THE SURGICAL TREATMENT OF ESSENTIAL HYPERTENSION

JAMES L POPPEN, M D.
and
CHARLES LEMMON, M.D.
Boston

The study of results obtained from extensive thoracolumbar sympathectomies performed on patients with hypertensive disease is important. Only a few noteworthy series have been reported.[1] They include a sufficient number of cases, however, to indicate without much question that surgical intervention in the treatment of hypertension is worth while in well selected patients.

That hypertension is a disease that must remain primarily the problem of the internist is not questioned by the surgeons interested in the surgical aspect of the treatment. It is important, however, to emphasize that neurosurgeons Peet[1a] and Adson[2] were instrumental in stimulating wide interest in the study of hypertension by attacking the sympathetic nervous system in a sufficient number of patients to establish the fact that in a few patients a definite and prolonged fall in blood pressure could be expected, as well as relief of disabling subjective symptoms in a still greater number.

The results obtained in 100 consecutive cases by extensive thoracolumbar sympathectomy performed one and a half to four years ago by the same surgeon (J. L. P.) were selected for study. More than 300 patients have been subjected to surgical intervention for the treatment of hypertensive disease by the same surgeon. The early experiences have been previously reported,[3] and the others are too recent to permit definite conclusions to be drawn from their study.

The surgical attack on the sympathetic nervous system in the treatment of hypertension was suggested in 1923 by Daniélopolu,[4] and Bruning[5] in the same year made similar proposals. Pende[6] in 1924 suggested resection of the left splanchnic nerve for hypertension. Pieri[7] in 1927 performed a unilateral splanchnicectomy for intestinal atony. In 1930, at the suggestion of Pende, he resected the left splanchnic nerves by a supradiaphragmatic approach in 2 patients who had arterial hypertension. Pereira[8] objected to the supradiaphragmatic approach because of the danger of entering the pleura and suggested in its stead resection of the splanchnic nerve below the diaphragm. Craig[9] in 1932 performed a subdiaphragmatic resection of the greater and the lesser splanchnic nerves and section of the sympathetic trunk between the twelfth thoracic and the first lumbar ganglion. On April 1, 1933, by the removal of a 4 cm. section of the eleventh rib, Craig resected the major and lesser splanchnic nerves. The pleura was inadvertently opened during the surgical procedure, so he discarded this technic. Peet[10] first performed his bilateral one stage supradiaphragmatic resection in November 1933. His technic, which has changed little since that time, consists of resection of a 4 cm. segment of the eleventh rib and a supradiaphragmatic resection of segments of the greater and lesser splanchnic nerves as well as the sympathetic chain from the ninth or tenth through the twelfth thoracic ganglion. In 1935 Adson[11] carried out a two stage bilateral subdiaphragmatic resection of all the splanchnic nerves at the point at which they penetrated the diaphragm, with resection of the first and second lumbar ganglions. Through this approach exploration and biopsy of the suprarenal glands and kidneys are possible. Crile[12] began celiac ganglionectomies for hypertension in 1936. In the fall of 1938 Smithwick,[1b] after experience with some of the aforementioned procedures, combined the Adson and Peet technics and removed longer segments of the sympathetic chain extending from the tenth thoracic through the second lumbar ganglion, including the splanchnic nerves

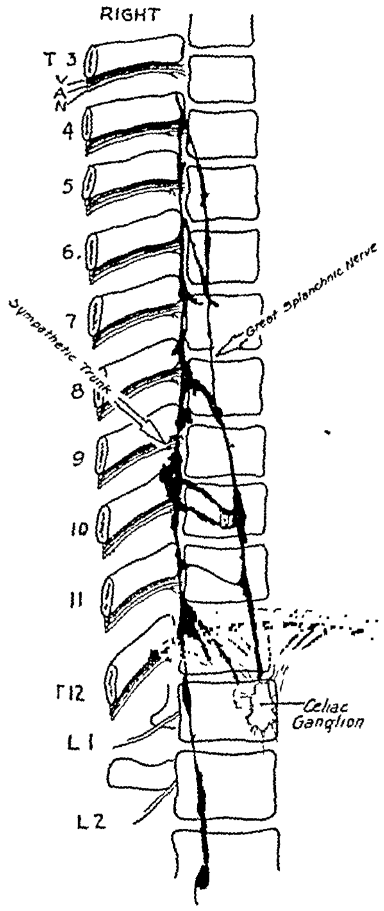
transdiaphragmatically. Grimson[1c] in 1941 suggested complete sympathectomy transpleurally.

The surgical experience of one of us (J. L. P.) with hypertension began in 1934, the technic of Peet being followed. In 1936 the technic employed by Adson and Craig was adopted. From 1938 to 1940 the Adson technic combined with a unilateral nephro-omentopexy was used. Since 1940 the supradiaphragmatic technic of Peet and the subdiaphragmatic technic of Adson have been combined by one of us (J. L. P.) in a modified form, approximately the same ganglions and corresponding lengths of the splanchnic nerves being removed without dividing the diaphragm.[13] Since 1942 we have come to believe that a more extensive removal of the sympathetic nervous system is indicated, not only to influence the immediate postoperative results but also to attain, if possible, a more permanent lowering of the blood pressure, the fact being recognized that the sympathetic nervous system has a great capacity for regeneration. The technic was modified considerably as time went on, so that at present an operation is employed in which the ganglions from the fourth thoracic through the second lumbar ganglion are removed in a long, connected segment, as shown in the illustration.



Factual evidence of the extensiveness of the sympathectomy is recorded in all cases by photographing the operative specimen placed on a schematic drawing.

The thoracolumbar sympathectomy as performed by Smithwick has been modified by one of us (J. L. P.) into a more extensive surgical procedure in the hope that a more complete and permanent splanchnic denervation can be accomplished. This method allows one to resect the sympathetic chain at a higher level, including the entire splanchnic system, thus interrupting any smaller unrecognized paravertebral fibers and also any fibers that may descend along the aortic network from high in the thorax.

The diffuse and variable nature of the autonomic nervous system is well recognized. It is known that an incomplete denervation seriously compromises the results in sympathetic nerve surgery of the extremities. There is no reason to assume that a different situation exists in denervation of the splanchnic area. We have gathered experimental evidence, to be published later, that the thoracolumbar operation performed in most of the cases in our series does not result in a complete splanchnic denervation. It is highly probable that there exist fibers or alternate pathways with which we are unacquainted. The operative approach also permits removal of the ganglions on the left side up to the stellate ganglion in patients with angina pectoris, so as either to abolish or to ameliorate their subjective attacks.

OPERATIVE TECHNIC

Early in this series the operation extended from the ninth thoracic through the second lumbar ganglion. While the present technic was being gradually evolved the thoracic sympathetic chain was resected at a higher and higher level. When the last patients in the series were operated on, the resection was carried out from the fifth thoracic to the second lumbar ganglion. Throughout the past twelve months the resection has extended from the third or fourth thoracic through the second lumbar ganglion.

Briefly, the operation as performed today[14] is done under high spinal anesthesia with a sensory level at the third or fourth thoracic segment. This anesthesia is supplemented by pentothal sodium and occasionally curare, which induces shallow, slow respiration, care being exercised to see that the patient is well oxygenated. With the patient in a lateral, slightly prone position, a semicurved incision is made from the level of the sixth rib over the eminence of the paraspinal muscles to the eleventh rib and is curved anteriorly just below the border of the twelfth rib. The iliocostal and longissimus dorsi muscles are separated over the eleventh and eighth ribs, allowing 3 or 4 cm. sections of the ribs to be removed paravertebrally. The line of cleavage between the endothoracic fascia and the parietal pleura is developed. The sympathetic chain and splanchnic nerves are mobilized, and the thoracic chain is divided just above the third or fourth thoracic ganglion after severing the rami communicantes. Below the diaphragm the greater and lesser splanchnic nerves are severed at the point where they enter the celiac ganglion and the least splanchnic nerves as they enter the aorticorenal ganglion. The sympathetic trunk is sectioned below the second lumbar ganglion. In an attempt to prevent regeneration, tantalum clips may be placed on the chain above the third or fourth thoracic ganglion, below the second lumbar ganglion and at the site at which the splanchnic nerves have been divided at the celiac and aorticorenal ganglions. The surgical specimen is now mobilized at the diaphragm, allowing removal of the entire thoracic and lumbar chain with its splanchnic branches through the aperture at the eleventh rib. Although opening of the pleura is carefully avoided whenever possible, this occurred in 5 per cent of our operations. The kidney and adrenal gland are palpated routinely and visualized whenever this seems warranted. Coagulation of bleeding points with the neurosurgical unit and the use of the silk technic for closure allow this surgical procedure to be performed in an average time of one to one and a half hours. The second stage is completed in a similar manner about ten days later.

The immediate postoperative complications in this series of 100 cases were wound infections (minor) in 4 cases; atelectasis in 6, pulmonary embolus in 2 and coronary thrombosis (fatal) in 1. Slight pleural effusion occurred in only 1 case, in which it was necessary to aspirate.

SELECTION OF PATIENTS

Sympathectomy for hypertension has been performed in a large number of cases. An unfavorable impression of the operation is gathered from many of the early reports. However, in the evaluation of this procedure one must remember that many of the early operations were performed on an unselected group of patients, many of whom would not be subjected to surgical intervention at the present time. Results have shown to our satisfaction that this operation is of little or no benefit to those who have suffered severe cardiovascular and renal damage. We believe that the splanchnic operation for high blood pressure in a selected group of cases has definite merit in securing relief of symptoms and lowering of the blood pressure and in prolonging life expectancy.

The patients with early hypertension and those with hypertension of a slowly progressive, mild nature have not been subjected to surgical operation. Usually these cases are satisfactorily treated by conservative medical management. We consider this opinion to be based on sound clinical experience. It has been clearly shown that in mild cases there is a practically normal life expectancy and that the duration of the disease has no significant effect on good results following operative intervention. It is imperative, however, that these patients receive regular and careful examination. Those showing evidence of progression into a more advanced form of the disease should immediately be considered for surgical treatment.

Table 1.—*Results Indicated by Sodium Amytal Test*

	Good		Fair		Unsatisfactory		
	Indicated	Actual	Indicated	Actual	Indicated	Actual	Total, Actual
Grade 2	51	37	11	13	7	15	3
Grade 3	7	9	13	7	3	8	2
Grade 4	4	1	2	3	2	0	2
Totals	62	47	26	23	12	23	7

In well established hypertension there is a pressing need for a test or some method of selecting cases that will indicate the good or poor results to be expected from surgical intervention. The meticulous and extensive studies of these patients done in most clinics represent an attempt to find some such criteria. Several tests are of considerable value in determining the merits of operation, but none of them alone is of great significance. The correlation of all these tests and the clinical picture helps one to predict the probable poor results more accurately than the good results. In too many of our patients the results thus indicated as good subsequently proved to be unsatisfactory (table 1). This may have been due not to the test but to the method of denervation, as previously suggested, but this cannot be true in all the patients who have not been benefited by the operation.

The results indicated by the different preoperative studies in general use will be compared with the actual postoperative results.

The study of hypertensive patients at this clinic consists in a general history and physical and laboratory examinations. Special emphasis is placed on age, duration of disease, the family and obstetric histories, the psyche and cardiovascular and renal studies. The cardiovascular examination includes determination of the nature of the peripheral vessels and the pulse rate and rhythm, roentgen examination of the chest, an electrocardiogram and study of the ocular fundi with the pupils dilated. The renal study includes intravenous pyelograms, phenolsulfonphthalein sodium excretion, a urea clearance test, a urine concentration test, and determination of the nonprotein nitrogen and blood urea nitrogen. The clinical laboratory studies include a complete blood cell count, a urinalysis, a Hinton test and determination of the chlorides, protein and cholesterol. The blood pressure readings are taken every hour for twenty-four hours with the patient at rest in bed and during the sodium amytal test; in a few cases an epidural procaine block test has been utilized.

Table 2.—*Distribution by Sex and Age*

Age, Yrs.	Men	Women		Years
50 and over	2	3	Average age of series	36.4
40 to 49	17	14	Average age of women	35.2
30 to 39	18	26	Average age of men	38.1
20 to 29	5	13	Youngest (both women)	15 and 19
10 to 19	0	2	Oldest (woman)	54

There were 42 men and 58 women in the series (table 2). The known duration of hypertension is given in table 3.

RESULTS

That symptomatic improvement occurs and that incapacitated persons are rehabilitated has been clearly shown by all who have instituted the different recognized surgical procedures for hypertension. These effects are often present even though the blood pressure is not reduced. In other reported series studies of the heart, ocular fundi and kidneys have demonstrated that reduction of high blood pressure is not harmful but is actually beneficial. A survey of our results is in complete accord with these reports. It is believed that this reduction increases the life expectancy and that the closer the blood pressure approaches the normal range the better are the ultimate results. It seems reasonable not to expect restitution of normal blood pressure in all cases even though the preoperative tests may so indicate. Undoubtedly some pathologic changes have occurred in patients with hypertension, and these may account for the maintenance of the blood pressure at varying degrees above normal.

Table 3.—*Known Duration of Hypertension*

Years	No. of Cases
2	31
3 to 5	29
6 to 10	34
11	6

The large number of factors that cause a variation in blood pressure make comparable conditions for satisfactory studies difficult to obtain. Any one who has attempted to correlate blood pressure readings realizes that it is a most unsatisfying task. At present, however, the blood pressure as a single factor is the best prognostic sign. Until a sufficient number of years have elapsed to prove beyond a doubt that the operative survival curve is materially prolonged as compared with that of the medically treated cases of Keith, Wagener, and Barker,[15] results must be determined by blood pressure readings, reversal of electrocardiographic changes, roentgenologic evidence that the size of the heart has diminished or remained stationary, improvement in the arteries of the retina and the subjective relief of symptoms.

TABLE 4.—*Results from Extensive Sympathectomy*

Good		47%
Fair		24%
Unsatisfactory		22%
Over 15 mı		
No blood ı		
(22% rec		
operation)		
Fatal *		7%
Operative mortality	0.5%	
Case mortality	1.0%	

* Six patients died since dismissal from hospital; 1 patient died two days after the second stage operation from a coronary occlusion.

Peet [16] has indicated by his results that the operative survival curve is prolonged in hypertension grades 3 and 4.

The demonstration of an increase in life expectancy together with a more comfortable existence is a real criterion and cannot be refuted. All indications point in this direction, but many years of careful follow-up must be instituted to verify this.

The preoperative blood pressure was considered to be that taken on admission to the clinic or at the patient's last visit before hospitalization. It was frequently the maximal blood pressure reading taken. The admission blood pressure was taken as the preoperative pressure because it more closely approximated the conditions under which the follow-up blood pressure readings were taken, with the patient ambulatory in the clinic or in the referring physician's office. The sodium amytal test revealed the minimal blood pressure reading.

CRITERIA FOR BLOOD PRESSURE RESULTS

The blood pressure results (tables 4 and 5) were considered good when the patient was symptomatically relieved of his hypertensive complaints and was in good physical condition, and when the blood pressure dropped to and remained at a level generally accepted as nondangerous. In the literature, a blood pressure of 150 mm. systolic and 100 mm. diastolic has frequently been considered as a maximal normal one. It has also been used to indicate a good operative result. To set up such an arbitrary figure would make some of our good results fair and some of our poor results good. For example, with a blood pressure of 142 mm. systolic and 104 mm. diastolic in a rehabilitated man working full time who is in excellent health and feels well, the result must be considered fair rather than good if an arbitrary standard is used. On the other hand, a patient with anasarca whose blood pressure is 132 mm. systolic and 92 mm. diastolic or a patient with recurrent coronary infarction with a blood pressure of 125 mm. systolic and 95 mm. diastolic would have to be considered to show a good result. Surely these patients had poor results, regardless of blood pressure. With this in mind, we have carefully selected from this series the cases in which we consider the results to have been good.

TABLE 5.—*Results from Extensive Sympathectomy*

	Patients	Good	Fair	Unsatisfactory	Fatal *
Grade 2	72	39	16	16	1
Grade 3	19	4	8	4	3
Grade 4	9	4	0	2	3
Totals	100	47	24	22	7

* See footnote, table 4.

The patients with fair results were chosen in a similar manner, except that their postoperative blood pressure readings were higher than those of the group with good results. They have sustained and maintained a lower blood pressure in a relatively nondangerous zone. These patients were as comfortable and as well off in general as those with good results, except for a higher blood pressure.

TABLE 6.—*Cases Showing Evidence of Regeneration of Sympathetic Nerves and Possible Candidates for Further Surgical Intervention*

		Operation			Follow-Up		
		Date			Date

15	220/148	1	43	T9-L2 T8-L2	8 2	43 46	145/105 224/145
21	230/150	3	43	T8-L1 T8-L2	10 7 11	43 44 45	[illegible] [illegible] 188/120
22	220/150	3	43	T8-L1 T8-L2	7 2 4 11 2	43 44 45 45 46	135/110 145/110 204/122 205/142 222/150
37	210/120	9	43	T7-L2 T8-L3	3 2 4	44 45 45	164/110 170/108 210/120
38	210/140	9	43	T8-L2 T7-L2	3 7 11 1	44 44 45 46	138/100 118/ 85 138/114 200/156
51	240/140	4	44	T7-L2 T7-L2	6 10 2 6 11 2	44 44 45 45 45 46	165/ 95 170/ 94 180/100 170/ 95 190/106 222/122

The unsatisfactory results were those that occurred in patients who had no reduction in blood pressure, even though its level might qualify them for a rating of fair. For example, in a patient with a preoperative blood pressure of 170 mm. systolic and 100 mm. diastolic and a postoperative blood pressure remaining at this level, with recognition of the fact that hypertension is a progressive disease, it is possible that the progression was retarded or stopped by the operation. Nevertheless, these patients should be included in the group with unsatisfactory results. Patients with blood pressures that have been reduced but remain at 200 mm. systolic and 120 mm. diastolic, regardless of symptomatic relief, are included in the unsatisfactory group, because we consider these pressures to be in the danger zone. Also, patients ill from complications of hypertensive, cardiovascular or renal disease, such as cardiac decompensation and coronary infarction, are included in the group with unsatisfactory results, although the drop in blood pressure was good or could be classified as good or fair. As would be expected, the relief of the hypertensive symptoms occurred less frequently in the group with unsatisfactory results.

[15] Keith, N. M.; Wagener, H. P., and Barker, N. W.: Some Different Types of Essential Hypertension: Their Course and Prognosis, Am. J. M. Sc. **197:** 332-343 (March) 1939.

[16] Peet, M. M., and Isberg, E. M.: The Surgical Treatment of Essential Hypertension, J. A. M. A. **130:** 467-473 (Feb. 23) 1946.

We consider that a satisfactory result on the blood pressure has been obtained in 71 per cent of our cases. The blood pressure has been favorably affected in another 7 per cent. A poor result has occurred in 15 per cent (table 4). These cases comprise those in which no blood pressure response was obtained and those in which the patient was physically ill from hypertensive, cardiovascular or renal disease. Regardless of data on blood pressure, we believe that this operation must lengthen life to be retained as a sound surgical procedure. At present we believe that it increases longevity besides relieving symptoms and lowering the blood pressure. The known duration of the disease has no effect on the results in regard to blood pressure if the patient is selected for surgical intervention. However, from our early experiences, the patients selected are not over 50 years of age except in a few cases.

Table 7.—*Cases Indicating that Ejaculatory Mechanism May Not Be Entirely Controlled by Either the First or Second Lumbar Ganglion but More Likely Distributed Throughout the Lumbar Ganglions*

	Ganglions Resected*		
Case	Left	Right	
2	L2	L2	No ejaculation; potency unchanged
5	L2	L2	Libido diminished; power of ejaculation diminished
15	L2	L3	Libido and potency unchanged; ejaculation normal
27	L2	L1	Libido and potency unchanged; ejaculation normal
31	L2	L2	Libido and potency unchanged; ejaculation normal
35	L2	L2	Impotency preoperatively; libido, potency and power of erection improved; ejaculation normal; baby boy
38	L2	L2	No ejaculation; no coition except in morning (poor blood pressure result)
44	L2	L2	Libido and potency diminished; ejaculation incomplete
56	L3	L3	Libido and potency diminished; ejaculation absent at first; normal later
59	L3	L2	Libido and potency unchanged; no ejaculation

65	L2	L2	Libido and potency unchanged; no ejaculation
72	L2	L2	Libido and potency unchanged; no ejaculation
84	L2	L2	Libido and potency unchanged; ejaculation 75 per cent of normal
85	L2	L1	Impotency preoperatively; libido and potency much improved; ejaculation normal
103	T12	L2	Libido and potency unchanged; no ejaculation

* Lumbar ganglions given indicate lowermost extent of resection.

CONTRAINDICATIONS TO SURGICAL INTERVENTION

The contraindications to surgical intervention are: cardiac failure; renal failure, and severe retinal arteriosclerosis of the silver wire type, with all tests indicating a fixed type of blood pressure. In addition, patients with early and mild cases of hypertension are not operated on. Considerable caution should be exercised before resorting to operative intervention in patients with angina pectoris, auricular fibrillation or gallop rhythm. Cerebrovascular accidents are not in themselves a contraindication to surgical procedures, as is indicated by our results.

INDICATIONS FOR SURGICAL INTERVENTION

Operative intervention is advised in progressive essential hypertension regardless of age (under 50), sex or the known duration of the disease if the ocular fundi (tables 6 and 7) are of grades 2, 3 or 4 and if clinical tests have indicated a good or fair result. With grade 4 ocular fundi, especially in young people, an operation is advised as early as possible if the cardiac and renal functions are adequate. The usual clinical tests are of little value. In some of these cases results were excellent, even though the clinical tests indicated poor ones. Except in a few cases, surgical intervention is not advised in patients with ocular fundi of grade 2 or 3 in whom the tests show no evidence of a favorable blood pressure response. It is in this group that emotion is stirred and the desire to do everything possible to help is aroused. On the other hand, most of the deaths and many of the poor results have occurred in *this same group.*

Table 8.—*Results According to Age of Patient*

	Good		Fair		Poor	
Age, Yrs.	Cases	%	Cases	%	Cases	%
10 to 19	2	100.0	0	0	0	0

50	1	50.0	0	0	1	50.0
	39		22		23	

INDICATIONS FOR REOPERATION

Patients whose blood pressure has not been materially changed by operative intervention except for a temporary postural hypertension are not benefited by the removal of more thoracic ganglions. A patient whose blood pressure has shown definite lowering for a period of one to two years, followed by a return to previous levels, and who has had a recurrence of subjective symptoms should be considered a candidate for reoperation. If tests demonstrate regeneration of the sympathetic fibers, reoperation is justifiable.[16a] It is our hope to prevent regeneration as far as possible by executing a fairly complete removal of the splanchnic system at the initial operation. Reoperation necessarily is definitely more difficult than the primary procedure. That resumption of high blood pressure may take place after a number of years is indicated by the 8 cases presented in table 8. It is in these patients that reoperation seems justifiable.

EFFECTS OF EXTENSIVE SYMPATHECTOMY ON THE SEXUAL POWERS

That the lumbar ganglions have a definite influence on the ejaculatory power in the male is well known and is indicated by the following results of surgical operation in this series. Forty-one per cent of the male patients had normal ejaculation after the operative procedure and 21 per cent had no ejaculation. In 18 per cent the power of ejaculation was diminished. Libido and potency were the same as before operative intervention in 65 per cent, diminished in 23 per cent and improved in 12 per cent. That the power of ejaculation is predominantly controlled by either the first or second lumbar ganglion is not substantiated by the operative results in 16 cases studied from that point of view (table 9).

Table 9.—*Results According to Known Duration of Disease*

	Good		Fair		Poor	
Age, Yrs.	Cases	%	Cases	%	Cases	%
2 and under	14	51.9	4	14.8	9	33.3

[16a] *Dr. Kurt Richter, Johns Hopkins Hospital,* has studied many of our patients at varying intervals postoperatively from the standpoint of skin resistance.

It seems reasonable to assume that in a system so variable as to the structure of the ganglions and the number of rami, the ejaculatory power may at times be distributed equally in the lumbar ganglions, even though most frequently one must assume that the first or second lumbar ganglion is predominantly in control.[17] Our results do not prove which of these is the more dominant, but there is evidence that resection of both of them frequently interferes with the ejaculatory power. One of the patients who was impotent and childless had been married for ten years before the operation. He had never used any contraceptive devices. Resection included the first and second lumbar ganglions on both sides. Twenty-eight months after the surgical procedure he stated that the power of erection, libido and potency were excellent and ejaculation was normal. This patient now is the father of a baby boy.

Abnormal change were not noted in the females. Two women have completed pregnancy since the operation. In the first, the preoperative blood pressure was 220 mm. systolic and 150 mm. diastolic. Surgical intervention was performed in October 1942 with removal of the tenth thoracic to the second lumbar ganglions bilaterally. The prenatal blood pressure was constant at 120 mm. systolic and 80 mm. diastolic. A full term delivery occurred on April 9, 1945. In December 1945 the blood pressure was 120 mm. systolic and 80 mm. diastolic.

In the second case the preoperative blood pressure was 265 mm. systolic and 152 mm. diastolic. Operative intervention was performed in March 1944, with resection of the seventh thoracic through the second lumbar ganglion bilaterally. In May 1944 the blood pressure was 170 mm. systolic and 115 mm. diastolic. In the fourth month of pregnancy it was 190 mm. systolic and 110 mm. diastolic, after which it gradually rose to 240 mm. systolic and 140 mm. diastolic. After delivery, which occurred at eight months on July 2, 1945, it returned to 180 mm. systolic and 110 mm. diastolic.

UNILATERAL KIDNEY DISEASE

In this series of 100 cases of essential hypertension, 6 nephrectomies were performed in combination with extensive bilateral sympathectomy. Associated hypertension and unilateral kidney disease should be treated as a separate entity; that is, if the latter is sufficient to warrant removal of the kidney, this should be done. The kidney should not, however, be removed solely in the hope that this will result in a lower blood pressure. In fact, it is dangerous to remove functioning renal tissue from a patient who may eventually die from uremia. There are, however, cases on record in which the blood pressure has been lowered to normal by removal of a diseased kidney. In hypertensive patients who undergo a nephrectomy for unilateral kidney disease, we perform a thoracolumbar sympathectomy at the same time.. If the blood pressure remains normal for ten days to two weeks the patient is discharged. If it returns to its preoperative level, as is the rule in all unilateral operations for hypertension, the sympathectomy is completed on the other side. In our 6 cases of nephrectomy combined with bilateral extensive sympathectomy the response of the blood pressure was good in 4, fair in 1 and unsatisfactory in 1. Brief reports of these cases follow.

Case 13.—The patient had a nonfunctioning kidney. The ocular fundi were grade 4. The microscopic diagnosis was hydronephrosis with nephrosclerosis. The blood pressure result was good.

Case 18.—The patient had a tumor in the lower pole of the right kidney. The ocular fundi were grade 2. The microscopic diagnosis was renal cell carcinoma. The blood pressure result was unsatisfactory.

Case 19.—The patient had a nonfunctioning kidney. The ocular fundi were grade 2. The microscopic diagnosis was chronic pyelonephritis. The blood pressure result was fair.

Case 64.—A cyst of the right kidney was shown by intravenous pyelogram. The ocular fundi were grade 2. The microscopic diagnosis was chronic pyelonephritis. The blood pressure result was good.

Case 71.—Nephrolithiasis in a contracted kidney was shown by intravenous pyelogram. The ocular fundi were grade 2. The microscopic diagnosis was nephrolithiasis and healed pyelonephritis with arteriosclerosis. The blood pressure response was good.

Case 95.—Disease of the right kidney was shown by intravenous pyelogram. The ocular fundi were grade 2. The microscopic diagnosis was healed pyelonephritis. The blood pressure result was good.

HEMIPLEGIA

Our experience with hemiplegia has been limited, since only 3 patients in this series have had cerebrovascular accidents at any time during the course of their disease. In general hemiplegia is not a contraindication to surgical intervention; if the patient is a good risk in other respects, the operation should be performed. The reports of these cases are as follows.

Case 8.—The ocular fundi were grade 4. The patient suffered hemiplegia on the left side two days after the first stage of the operation. The second stage was performed at the usual time. At present there is a good blood pressure response, and the hemiplegia is almost completely cleared. On May 15, 1945 closure of ruptured peptic ulcer occurred. The patient plays golf and drives his automobile.

Case 22.—The ocular fundi were grade 2. The patient suffered a hemiplegia in February 1943. Extensive sympathectomies were performed in March 1943. At the end of one year the blood pressure result was considered fair. At the end of three years it was poor. The only complaints at present are fatigue and worry about the blood pressure and the possibility of another hemiplegia. The ocular fundi are grade 2, with decided segmental intermittent vasoconstriction. The patient has returned to the hospital for reevaluation of his case, with the possibility of further resection.

Case 26.—The ocular fundi were grade 3. Surgical intervention was performed in May 1943. A fair blood pressure result was obtained and has been maintained. On Aug. 16, 1944 a mild hemiparesis occurred on the right side. The patient returned to work in three weeks and has had no complaints except some numbness on the right side.

CORONARY THROMBOSIS

There were 3 cases of myocardial infarct. Such patients are exceedingly poor risks, and it is doubtful that their life expectancy can be prolonged by lowering the blood pressure.

Case 70.—A man aged 51 had known hypertension of six years' duration. He complained of headache, dizziness, nervousness and insomnia. He had a possible coronary thrombosis on Nov. 1, 1942. The ocular fundi were grade 3. The preoperative blood pressure was 250 mm. systolic and 146 mm. diastolic to 205 mm. systolic and 140 mm. diastolic; with the sodium amytal test it was 140 mm. systolic and 100 mm. diastolic. At operations performed September 6 and September 20 the sixth thoracic to the second lumbar ganglions were resected. The postoperative blood pressure was 190 mm. systolic and 100 mm. diastolic before death, which occurred suddenly two days after the second stage operation, on Sept. 22, 1944, after gasping, cyanosis and a falling pulse. No autopsy was performed. The clinical diagnosis was coronary thrombosis.

---

[17] de Takats, G., and Helfrich, L. S.: Sterility of the Male After Sympathectomies, J. A. M. A. **117**: 20-21 (July 5) 1941.

Case 82.—The patient was a 45 year old man with known hypertension for nine years. Myocardial infarction had occurred eight years previously, and more recently there had been symptoms of angina pectoris. The ocular fundi were grade 2; there was auricular fibrillation.

The preoperative blood pressure was 200 mm. systolic and 150 mm. diastolic. With the sodium amytal test it was 150 mm. systolic and 90 mm. diastolic. The two stage operation was performed, with resection from the sixth thoracic to the second lumbar ganglion and from the sixth thoracic to the first lumbar ganglion, in January 1945. The patient subsequently had an anterior myocardial infarction. He gradually recovered and returned to work but remained in poor condition. In September 1945 he complained of dyspnea, edema of the ankles and attacks of precordial distress. He was advised to stop work and go to bed. In January 1946, after three months in bed, he had cardiac decompensation with anasarca despite intensive medical treatment.

Case 97.—The patient was a 33 year old man with known hypertension for four years. He complained of severe headache, nausea, vomiting and giddiness. The preoperative blood pressure was 180 mm. systolic and 120 mm. diastolic. With the sodium amytal test it was 110 mm. systolic and 75 mm. diastolic. The ocular fundi were grade 2. The patient was considered an ideal candidate for splanchnicectomy, which was performed in May, 1942: the tenth thoracic to the second lumbar ganglions were removed, and after the second stage the patient suffered a pulmonary embolus from the left thigh. He gradually recovered, and the blood pressure result was considered fair. He returned to his work as a banker. Within the last few months he has had at least two coronary attacks. At present he has no thoracic pain, angina or cardiac decompensation. The blood pressure is 125 mm. systolic and 90 mm. diastolic. The patient has recently applied for compensation for complete disability. The result is considered to be poor.

ANGINA PECTORIS

Eight patients had angina pectoris. In these cases, also, the likelihood of death or a poor result is definitely increased.

Case 4.—The patient was a 40 year old man with known hypertension of three years' duration. He complained of severe occipital headaches. The preoperative blood pressure was 185 mm. systolic and 115 mm. diastolic to 270 mm. systolic and 150 mm. diastolic. With the sodium amytal test it was 160 mm. systolic and 115 mm. diastolic to 200 mm. systolic and 125 mm. diastolic. The postoperative pressure was 150 mm. systolic and 90 mm. diastolic to 200 mm. systolic and 125 mm. diastolic.

This patient had a normal blood pressure in 1939. He was treated in the medical department in 1940, at which time the hypertension was first observed. The two stage operation was performed on Sept. 11 and 23, 1942, removing the tenth thoracic to the second lumbar ganglion, right and left. On his discharge from the hospital on October 15, the blood pressure was 150 mm. systolic and 90 mm. diastolic to 200 mm. systolic and 125 mm. diastolic. The patient was symptomatically improved and had no headaches. He returned to the hospital in January 1943 with complaints of nocturnal dyspnea and edema of the ankles for four weeks. There was anasarca. The ocular fundi were grade 4. The congestive failure did not respond to medical management. The nonprotein nitrogen was within normal range until April 28, 1943, when it was 58 mg. per hundred cubic centimeters. It gradually rose to 175 mg. on July 22, 1943. The blood pressure averaged 250 mm. systolic and 130 mm. diastolic for several months and then fell precipitously to 140 mm. systolic and 100 mm. diastolic two days before the patient's death, which occurred on Aug. 11, 1943 from uremia. Autopsy revealed cardiac and renal failure, cardiac hypertrophy and anasarca and nephrosclerosis.

Case 11.—The patient was a 46 year old white man with known hypertension of five years' duration. He complained of headache, angina pectoris and episodes of cerebral spasm. Ocular fundi were grade 2, with grade 3 to 4 arteriolar sclerosis of the retinal vessels. The preoperative blood pressure was 165 mm. systolic and 110 mm. diastolic to 240 mm. systolic and 120 mm. diastolic. With the sodium amytal test it was 110 mm. systolic and 60 mm. diastolic. The patient accepted the operative intervention, knowing that he had little chance for relief. The two stages were performed on Nov. 3 and 12, 1942. The postoperative blood pressure was 200 mm. systolic and 100 mm. diastolic. In May 1943 the administration of potassium thiocyanate was tried, without relief of the headaches and with no blood pressure response. The patient never fully recovered from the operation and died on December 29 of a heart attack. No postmortem examination was made.

Case 42.—The patient was a 47 year old woman with known hypertension of ten years' duration. She complained of headache, dizziness, nausea and vomiting. The ocular fundi were grade 4. The case was diagnosed at admission as one of possible brain tumor. The preoperative blood pressure was 280 mm. systolic and 200 mm. diastolic. With the sodium amytal test it was 140 mm. systolic and 100 mm. diastolic. The surgical operations were performed in November 1943. In June 1944 the fundi were normal, there was a rare complaint of mild headache and the patient was working eight hours a day. The postoperative blood pressure was 180 mm. systolic and 110 mm. diastolic to 168 mm. systolic and 100 mm. diastolic. On July 5, 1945, when the blood pressure was 140 mm. systolic and 85 mm. diastolic, a hysterectomy and bilateral salpingo-oophorectomy were performed. On August 2, there were no complaints and the blood pressure was 154 mm. systolic and 82 mm. diastolic. The patient was considered to have a good result but died suddenly of a cerebral hemorrhage in another city on Oct. 20, 1945.

Case 74.—The patient was a 41 year old man with known hypertension of three years' duration. He complained of headache, giddiness and angina. The preoperative blood pressure was 260 mm. systolic and 140 mm. diastolic. With the sodium amytal test it was 110 systolic and 84 diastolic. The ocular fundi were grade 2. The operative intervention was performed in September 1944. The angina disappeared in two to three months. The patient could not tolerate glyceryl trinitrate, even 1/500 grain (0.12 mg.) causing giddiness and weakness. Papaverine hydrochloride was used in its place, with satisfactory results. The blood pressure is now 145 mm. systolic and 108 mm. diastolic. The angina has completely disappeared, and there are no complaints. The patient is working and has recently passed a general examination for employment by the Western Electric Company.

Case 77.—The patient was a 46 year old woman with known hypertension of ten years' duration. She complained of angina pectoris and nervousness. The ocular fundi were grade 2. The preoperative blood pressure was 270 mm. systolic and 150 mm. diastolic. With the sodium amytal test it was 150 mm. systolic and 100 mm. diastolic. The operation was performed in April, 1945; from the fifth thoracic to the second lumbar ganglions were removed bilaterally. There were severe attacks of angina subsequent to the surgical intervention. These continued for six months. The patient took 1/400 grain (0.15 mg.) of glyceryl trinitrate, following which the angina gradually subsided. At present it is not nearly so severe or so frequent as it was before the operation. The patient is comfortable during warm weather. The blood pressure is 218 mm. systolic and 122 mm. diastolic.

Case 100.—The patient was a 50 year old woman with known hypertension of nine years' duration. She complained of headache, tenseness and angina pectoris. The preoperative blood pressure was 210 mm. systolic and 130 mm. diastolic. With the sodium amytal test it was 165 mm. systolic and 100 mm. diastolic. The ocular fundi were grade 2. At the operation performed in May, 1945, the fifth thoracic to the second lumbar ganglions, right and left, were removed. The angina has gradually become less in severity and frequency.

Case 45.—The patient was a 25 year old woman with known hypertension of two years' duration. She complained of severe headache, nervousness and tension. The ocular fundi were grade 4. The patient insisted on surgical intervention. The preoperative blood pressure was 240 mm. systolic and 175 mm. diastolic to 220 mm. systolic and 150 mm. diastolic. With the sodium amytal test it was 200 mm. systolic and 150 mm. diastolic. The first stage operation was performed on Nov. 14, 1943. On discharge from the hospital December 16, after this operation, the blood pressure was 190 mm. systolic and 140 mm. diastolic. On three occasions over a liter of fluid was removed from the pleural cavity. On March 15, 1944 the blood pressure was 244 mm. systolic and 160 mm. diastolic; the nonprotein nitrogen level was 52 mg. per hundred cubic centimeters. The patient died on April 6, 1944 of malignant hypertension with hypertensive cardiovascular renal disease.

Case 57.—The patient was a 36 year old man with known hypertension of eight years' duration. He complained of occipital headache, blurring vision and angina pectoris. The ocular fundi were grade 3. A gallop rhythm was present. The preoperative blood pressure was 220 mm. systolic and 130 mm. diastolic to 200 mm. systolic and 130 mm. diastolic. With the sodium amytal test it was 166 mm. systolic and 86 mm. diastolic. The two stages of the operation were performed on March 5 and April 4, 1944. No postoperative difficulties were encountered. The blood pressure on discharge was 155 mm. systolic and 100 mm. diastolic. The patient died suddenly on Dec. 21, 1944, probably from coronary thrombosis.

COMMENT

The final opinion as to the merits of thoracolumbar sympathectomy as a means of treatment of essential hypertension must necessarily remain open until the surgical and medical survival curves can be compared. Since the operative mortality is 0.5 per cent and since several previous reports, as well as those of our series, indicate that a substantial number of patients obtain a good result, as evidenced by an arrest of the disease which allows a considerably more comfortable existence, we can arrive at no other opinion than that the procedure is well worth while in a selected group of patients.

Table 10.—*Summary of Data on Blood Pressure in Three Cases*

Case	Preoperative Blood Pressure	Date of Operation Mo.	Date of Operation Yr.	Follow-Up Date Mo.	Follow-Up Date Yr.	Follow-Up Blood Pressure

* Died Oct 20, 1945 of a cerebrovascular accident.

One must not fail to realize that hypertension is the leading cause of death and is four times as deadly as cancer. In many cases it causes as much discomfort to the patient as does cancer, in which one does not hesitate to make use of surgical means or roentgen therapy in an attempt to cure the disease or to lessen suffering. It is true that sympathectomy in the treatment of hypertension may eventually be replaced by well directed operation on the blood pressure centers intracranially or by the discovery of certain chemical or hormonal substances that will cure the disease. On the other hand, this may not occur in the present generation. Therefore, a surgical procedure that gives reasonable assurance of correcting or lessening the effects of the disease should be instituted until a more efficacious treatment has become available.

The criticism of this operation lies in the fact that the patient is hospitalized for a period of about four weeks. Four days of this is spent in study. Many patients have considerable postoperative neuralgia, which lasts for several days or several weeks after their return home. Because of the alterations in blood pressure produced by changes in position, the legs and abdomen may need firm pressure bandages or support so as to avoid syncope or palpitation for several weeks or months after the operative procedure until a thoroughly stable blood pressure has been established.

The selection of patients for surgical intervention cannot be decided entirely by dogmatic criteria. That age should be considered an important factor is based on common sense. Certainly, most persons who have reached the age of 50 have thickening of the walls of the arterial system, regardless of whether this fact can be demonstrated grossly. Much of course, depends on heredity. Many of the patients operated on early in our experience were over 55 years of age and showed extensive arterial changes. We concluded that in any patient 50 years of age or over there should be a degree of hesitancy in advising surgical intervention.

Emphasis must be placed on the longevity of the blood relatives. It is logical to assume that a family history of hypertension of short duration, causing early breakdown of the cerebrovascular and renal systems, is potentially much more serious than a history in which the blood relatives have had hypertension for many years but have lived a normal span of life, finally dying of cerebral hemorrhage or uremia.

It was stated previously herein that in early cases and those with grade 1 ocular fundi the patients do not require surgical intervention and can be satisfactorily handled by medical treatment. This opinion may change as time goes on and more information concerning the life expectancy in such patients on medical treatment alone becomes available. Certain patients in the group with grade 1 ocular fundi may actually need surgical intervention, especially when intracranial symptoms can be directly attributed to the hypertension. It is possible that more of these patients should be subjected to surgical intervention than we have heretofore thought necessary.

The cases classified as grade 4, with choking of the optic disks and retinal hemorrhages occurring in relatively young patients and with a fulminating or rapidly progressing hypertension, form a group in which operative intervention should be performed as soon as possible, because when this has been delayed until after elevation of the nonprotein nitrogen has taken place, the results have been poor.

The ultimate results of the operation cannot be predicted from the immediate postoperative blood pressure readings. There is always a dramatic lowering for three or four days after the first stage of the sympathectomy. The blood pressure is usually at the preoperative levels on the seventh postoperative day. The level is again dramatically lowered for several days after the second and final stage of operation and does remain so in many cases. In others, however, there is a rise on the seventh day or at the time the patient begins to become more active, and the blood pressure may reach its preoperative level except in the sitting or standing position when there is a decided postural hypotension. The lower blood pressure level may take place in a few days or weeks; that this lowering may be gradual and occur over a period of several months, is indicated by the data on the blood pressure in 3 cases summarized in table 10.

SUMMARY

One hundred consecutive patients were subjected to extensive thoracolumbar sympathectomy by the same surgeon and carefully followed for one and a half to four years after operation.

The results of operation were as follows: good, 47 per cent; fair, 24 per cent, and unsatisfactory, 22 per cent. The operative mortality was 0.5 per cent (case mortality, 1 per cent). Six per cent of the patients died subsequent to their dismissal from the hospital.

MEDICAL EVALUATION OF THE SURGICAL TREATMENT OF HYPERTENSION

ROBERT STERLING PALMER, M.D
Boston

Common sense and clinical and scientific hypothesis as well hold that the unfavorable progress and end of patients with hypertension is related to the height of the blood pressure. Not the only test but an important test of any therapeutic procedure in continued arterial hypertension is the effect on the level of the blood pressure. Since it has been observed that most patients with essential hypertension have well defined spontaneous lowering of the blood pressure and that a considerable number have normal blood pressure levels transiently (23 per cent of early benign cases, 11 per cent of moderate cases, 8 per cent of advanced cases and even 8 per cent of malignant cases), the duration of the hypotensive effect and a fall to normal or near normal are important criteria for critical evaluation. As a medical observer I have been intimately associated with the surgical treatment of hypertension first for seven years and then after a hiatus of three years again for the past year, and certain observations in the course of this experience have been recorded (table 1).

I. *Interval Medical Evaluation of the Hypotensive Effect of Sympathectomy for Essential Hypertension.*—In September 1940 after five years of careful preoperative and postoperative observation of 74 patients with all grades of essential hypertension treated by supradiaphragmatic sympathectomy, it was found that 9, or 12 per cent, had normal or near normal blood pressures (150 mm. of mercury systolic and 110 mm. of mercury diastolic or less). The 74 patients were fairly equally divided among the four grades of hypertension. The favorable results occurred chiefly in patients with mild variable or moderate hypertension, grades 1 and 2.

Hypertension.—Grade 1: Variable hypertension, 150 to 200 mm. systolic and 100 to 120 diastolic, 23 per cent falling to normal levels (140 systolic and 90 diastolic or less) with rest or sedatives, occasionally under stress going above the limits noted; no changes or minimal changes in fundi as represented by narrowing of arterioles; minimal or no changes in heart or kidneys. This is early or mild hypertension.

Grade 2: Variable hypertension, 170 to 230 mm. systolic and 110 to 130 diastolic, usually at the lower levels, occasionally even lower, but falling to normal with rest or a sedative in 11 per cent, the fundi showing arteriovenous compression with widening of the light reflex, narrowing and caliber changes in the arterioles; the heart showing slight enlargement or prominence in the region of the left ventricle by roentgen examination; the urine showing no change or slight grades of albuminuria and minimal numbers of formed elements in the sediment; the renal function being normal or slightly impaired by concentration and intravenous phenolsulfonphthalein tests. This is moderate hypertension.

Grade 3: Variable (but usually upward) hypertension, almost always over 170 mm. systolic and 110 mm. diastolic but observed normal levels in 8 per cent; the fundi showing arteriovenous compression, caliber changes in arterioles, wide light reflex, often exudates or hemorrhages; the heart often enlarged commonly with symptoms and signs of actual or impending congestive failure or symptoms of anginal failure; the urine often showing albumin and casts; renal function often impaired, but actual failure (uremia) unusual; cerebral accidents sometimes occur. This is late benign hypertension, frequently of many years' standing.

Grade 4: Blood Pressure, especially the diastolic, usually decidedly high although exceptionally normal blood pressure levels may be observed; difficulties often of recent onset in a patient almost always under 50, often under 40 years of age, the cardinal sign being edema of the optic disks with or without exudate and hemorrhage; cardiac enlargement and congestive heart failure may be present; renal impairment and failure are common. This is malignant hypertension.

My surgical colleague at the time (Dr. R. H. Smithwick), as this experience developed, had suggested that a more extensive operation interrupting all sympathetic innervation of the splanchnic bed would reduce the possibility of regeneration and might equal the brilliant results obtained in these few patients and possibly extend the benefits to a significantly larger proportion. He gradually extended the operation first on one side, later on both sides to include the sympathetic chain from above the ninth dorsal to below the first or second lumbar ganglion.[1]

Table 1.—*Effect of Sympathectomy in Essential Hypertension*

Operation	Date of Survey	No. of Patients	Duration of Follow-Up	Percentage Fall to 150/110 or Less
Dorsal sympathectomy........	1940	74	5 yrs. ±	12%
Dorsolumbar sympathectomy	1940	29	Mos. to 2 yrs.	69%
Dorsolumbar sympathectomy	1941	40	Up to 3 yrs.	53%
Dorsolumbar sympathectomy	1943	101	62 for 1 yr. 22 for 1-2 yrs. 14 for 2-3 yrs. 3 for 3-4 yrs.	37.6%
Dorsolumbar sympathectomy	1946	72	Mos. to 3 yrs.	33%
Dorsolumbar sympathectomy	1946	68	3 or more yrs.	23.5%
Medical regimen incl. KSCN...	1943	100	Mos. to 4 yrs.	12%

In November 1940 29 patients had been treated by more extensive operations, 20 of them showing excellent results on the level of the blood pressure. For the first time patients with severer grades of hypertension were benefited. Seven of 10 patients graded 3 and 3 of 7 patients graded 4 appeared to have been helped much in respect to the blood pressure level, whereas none of the 34 patients equally divided between grades 3 and 4 had been so benefited by supradiaphragmatic sympathectomy.

The follow-up period on these patients with the more extensive operations at that time was short (a few months up to two years), but it then seemed clear that the more extensive the operation the more likely the excellent results on the level of the blood pressure: all sympathetic ganglions and nerves from above the ninth dorsal to below the first lumbar and preferably below the second lumbar segment should be removed

---

From the medical and surgical services and the Hypertension Research Committee, Massachusetts General Hospital.

[1] Smithwick, R. H.: A Technique for Splanchnic Resection for Hypertension, Surgery 7: 1 (Jan.) 1940.

on both sides. About a year later 49 patients had been treated by bilateral dorsolumbar sympathectomy (from the ninth dorsal to below the first or second lumbar ganglion) and were compared with patients who were closely similar in regard to sex, grade of disease and duration of known hypertension and who were on a medical regimen. Twenty-six, or 53 per cent, of these 49 patients had normal or near normal blood pressures.

Comparison, in respect to the blood pressure level, of the surgically-treated with concurrently medically-treated patients of closely similar age, sex, degree and duration of hypertension and time of follow-up was as follows:

Grade 1 hypertension: Of 12 patients surgically treated 10, or 83 per cent, were normal or near normal; of 26 patients medically treated 7, or 27 per cent, were normal or near normal.

Grade 2 hypertension: Of 7 patients surgically treated 5, or 70 per cent, were normal or near normal; of 7 patients medically treated 1 (14 per cent) was normal or near normal.

Grade 3 hypertension: Of 18 patients surgically treated 4, or 22 per cent, were normal or near normal, of 10 patients medically treated 1 (10 per cent) was normal or near normal.

TABLE 2.—*Comparison of Clinical Evidences of Organic Change*

		Sex		Fundi					Heart Size and Function				Renal Function			
	No	M	F.	0	1	2	3	4	No Change or Slight Enlargement	Moderate Enlargement	Decided Enlargement	Heart Failure	Normal	Impaired	Decided Impairment	
The dead—"certainly unsuccessful"	21	14	7	1	3	7	4	6	15	4	2	6	8	9	4	7 over 40 years of age; spontaneous fall to near normal 1/10; fall to normal with sedative test 1/3; very high diastolic pressure 2/5
Those with B. P. 150/110 or lower—"the certainly successful"	16	2	14	0	6	7	0	3	15	1	0	1	12	4	0	3 over 40 years of age; spontaneous fall to near normal 1/5; fall to normal with sedative test 1/2, very high diastolic pressure 1/5
Those who remain or have again become hypertensive—"the doubtful"*	31	10	21	1	8	9	7	2	25	5	1	3	21	10	0	12 over 40 years of age; spontaneous fall to near normal 1/3; fall to normal with sedative test 1/2; very high diastolic pressure 1/3

* Class undetermined, 4

Grade 4 hypertension: Of 12 patients surgically treated 5, or, if 2 with blood pressures slightly over 150 systolic and 110 diastolic are included, 7 (57 per cent) were near normal; all the patients with malignant hypertension who were medically followed died under observation or soon after or were lost and presumed dead. It appeared that grades 1, 2 and 4 hypertensive patients had the best chance of receiving benefit, that in any case in a parallel follow up of matched cases, dorsolumbar sympathectomy was *definitely superior to* medical treatment in controlling the blood pressure level.

In November 1943 the status of 101 patients was reviewed. All had been treated by dorsolumbar sympathectomy (including at least resection from the ninth dorsal through the first lumbar ganglion on both sides). Sixty-two had been followed for one year or less after operation, 22 for one to two years, 14 for two to three years and 3 patients up to four years. Thirty-eight, or nearly 40 per cent, had normal or near normal blood pressures. The duration of follow up was variable, and the data were the product of a number of different observers: nevertheless, it again appeared that a significant number of patients showed remarkable improvement in the blood pressure and the greater proportion of excellent results occurred in patients with grade 1, 2 and 4 hypertension.

After three years the result of surgical treatment of essential hypertension has again been evaluated medically with a review of 68 patients. All the patients had dorsolumbar sympathectomy for hypertension more than three years ago. Forty-seven of these patients are living; 16 of them with normal or near normal blood pressures and 8 with blood pressures entirely normal. Twenty-one of the 68 patients have died.

Thus during the period of observation in round figures 30 per cent have died,[2] 45 per cent have remained or have become hypertensive while 25 per cent have normal or near normal blood pressures, some of them (3 patients) five or more years after operation. In a carefully controlled group of 100 patients with hypertension on a general medical regimen plus the use of potassium thiocyanate, it had been found previously that, under the best conditions of medical treatment and follow-up, a sustained fall of the blood pressure to normal or near normal levels may be effected in 12 per cent.[3]

II. *The Clinical Characteristics of Sixty-Nine Patients Treated Three or More Years Ago by Dorsolumbar Sympathectomy.*—In the evaluation of results in the surgically-treated patients with hypertension, those in the dead may be considered as certainly unsuccessful and those in the living patients with normal or near normal blood pressures after at least three years as successful.

Sex and age: Of the 21 patients who have died 7 were women, 14 men; 7 were 40 years of age or older. Of the 16 patients in whom results are regarded to date as successful, 14 are women, 2 are men; 3 are 40 years of age or older.

Clinical evidence of organic change. A comparison of clinical evidences of organic change in these two groups (table 2) is as follows: Of the unsuccessfully treated, the heart was normal in 6, showed minimal enlargement in 9, moderate enlargement in 4 and decided enlargement in 2; actual failure was present in 6 patients. Of the 16 certain successes, the heart was normal in 8, showed minimal enlargement in 7 and moderate enlargement in 1 patient. One case was considered to show evidence of failure, and in another the presence of failure was questioned. Of the 21 failures, impairment of renal function was present in 13 and was well defined in 4 of these. Of the 16 successes, renal impairment was present in 4 and was questioned in 2 others. Of the 21 dead, the fundi were normal in 1, showed narrowing of the arterioles only in 3, arteriovenous compression and/or widening of the light reflex in 7; in addition to abnormal arterioles the fundi showed retinal exudate and hemorrhages in 4, and there was typical hypertensive neuroretinopathy with papilledema in 6. Of the 16 patients successfully treated by surgical means, 6 showed arteriolar spasm only, 7 showed arteriovenous compression and/or widening of the arteriolar light reflex, none showed retinal exudate or hemorrhage and 3 showed typical hypertensive neuroretinopathy with papilledema.

---

[2] In a control group of 646 hypertensive patients, the study of which was interrupted by the war, the mortality of the 50 per cent followed to date or death at that time (222 patients) was 30 per cent

[3] Fanson, E; Kinsey, D, and Palmer, R S Potassium Sulfocyanate Therapy in Essential Hypertension, New England J Med. **229:** 540 (Sept 30) 1943

While this series is too small and the number of observations too limited to be definite statistically, a comparison of preoperative blood pressure levels and variations offers tentative guidance. In these two groups, the certain failures and the certain successes, the preoperative levels of the blood pressure in general were comparable. In a greater proportion of the successes the blood pressure approached normal levels spontaneously (5 as compared with 2 of the failures). Extremely high maximum levels of the diastolic pressure (150 or more) were somewhat more frequent (9 of 21) in the unsuccessfully treated as compared with the therapeutic successes (3 of 16). With the sedative test strictly normal blood pressures were recorded preoperatively in 7 of the 14 successfully treated patients who were so tested, in 4 of the 13 failures so tested. In the successes and the failures there appeared to be about the same proportion of the relatively high diastolic pattern with narrow pulse pressure (considered most favorable) and of the relatively lower diastolic pattern with wider pulse pressure (least favorable).

There are 31 patients who have remained or have become hypertensive in the three or more years (5 of them over five years) since dorsolumbar sympathectomy; hence any improvement may be regarded as doubtful or equivocal. Of these 21 are women and 10 are men; 12 are 40 years of age or older. Prior to operative intervention the heart was normal in size in 11, showed prominence in the region of the left ventricle in 14, moderate enlargement in 5 and decided enlargement in 1. Actual failure of the heart was present in 3. Renal function was impaired in 10 patients, questionably so in 3. The fundi were normal in 1 patient, showed narrowing of the arterioles only in 8, wide light reflex and/or arteriovenous compression in 9, exudate and hemorrhages in 7 and typical neuroretinitis with papilledema in 2. Classification of the fundi was undetermined in 4 instances.

In general the blood pressure levels were comparable to those referred to as certain successes and certain failures. In this doubtful group spontaneous fall of the blood pressure to normal or near normal levels occurred in about one third of the patients, proportionately the same as among the successfully treated. With the sedative test the blood pressure of nearly half of those tested (10 of 22) fell to within normal limits, as in the successful group. Maximum diastolic pressures were decidedly high (150 or more) in about a third (10 of 31), which was proportionately more than among the successes and less than among the certainly unsuccessful. The most favorable blood pressure pattern (relatively high diastolic with smaller pulse pressure) was found more commonly in this doubtful group than in either successes or failures, and the least favorable pattern was less common in this group than in either of the other two.

Improvement in the electrocardiogram subsequent to sympathectomy has been reported.[4] Of these 68 patients there were 29 who had adequate postoperative follow-up electrocardiograms. Changes were slight and of doubtful significance in 4 patients. In 8 there was evidence of improvement. There was no change in 5, and the electrocardiograms were worse in 12. The significantly improved electrocardiograms occurred in 5 patients whose blood pressures are normal or near normal and in 3 of those who are again hypertensive. Electrocardiograms were worse in 4 of those whose blood pressures are normal or near normal and in 6 of those who are again hypertensive. The size of the heart, as judged by 7 foot (231 cm.) roentgenologic study, may become less after surgical operation. Such postoperative study has been done in 7 of the patients whose blood pressures are normal or near normal three or more years after operation. In 3 of these patients the shadow of the heart is considered smaller, and in 4 there has been no change. Of 13 patients who remain or again have become hypertensive in whom roentgenologic follow-up of the size of the heart has been done the shadow of the heart is smaller in 3, larger in 2 and shows no change in 8.

The grade of hypertension benefited is indicated by the fact that 75 per cent of the certainly successful patients were those with grade 1 or 2 hypertension, but among the successes was 1 patient designated grade 3 because she was considered to have actual heart failure. The most important observation is that 3 patients with malignant hypertension are now known to have normal or near normal blood pressures, 1 for over three years, the other 2 for slightly less than and slightly over five years, respectively. None of these 3 had any evidence of renal impairment by qualitative tests; none had any evidence of actual heart failure; only 1 showed slight cardiac enlargement. There are 2 patients with malignant hypertension in the "doubtful" group because they are still hypertensive. They are alive and working, 1 over three years and the other nearly five years after operation; they undoubtedly have had their lives prolonged and have been afforded a considerable respite from their disease. One had no cardiac or renal impairment; the other had questionable renal impairment. All 5 patients with malignant hypertension were seen and operated on very early in the malignant phase. Of the 6 patients with malignant hypertension who have died, 3 had impaired renal function, 1 of them to a moderately severe extent, and the other 3 had both renal and cardiac failure.

III. *Summary of Three to Five Year Follow Up of Patients with Essential Hypertension Treated by Dorsolumbar Sympathectomy.*—From a review of these patients (21 dead, and therefore failures; 16 with normal or near normal pressures three or more years after dorsolumbar sympathectomy, and therefore successes; 31 with hypertension three or more years after operation, and therefore doubtful or equivocal) it would seem that there are no positive tests or categories by which success or failure may be predicted accurately in an individual patient. In general it probably is true that the younger the patient (preferably under age 40) and the less the evidence of organic change the better the chance of an excellent result. The chances of women appear to be better, probably because the disease in general is more benign in women. The pattern of the blood pressures in these patients seems to have made little difference except that extremely high diastolic pressures are associated with more pronounced organic changes.[5] A spontaneous fall of the blood pressure to near normal while at rest in bed evidently is favorable but may occur in those whose blood pressure ultimately will be uninfluenced by operative intervention. With the sedative test a fall to normal is found less frequently in those who may be expected to die of their disease but about as often in those who remain or again become hypertensive as in those impressively benefited in respect *to their blood pressure levels. Finally, there is a diminishing* return of maintained normal or near normal blood pressures the longer one follows these patients. At first two thirds had blood pressures normal or near normal; later the figure was 50 per cent, then 40 per cent and now 25 per cent in patients followed three years or longer. At the present time, of 72 additional patients being followed for varying periods less than three years after operation, 24 (exactly one third) have blood pressures of 150 systolic and 110 diastolic or less. However, the comparison of 49 patients treated by dorsolumbar sympathectomy with 43 closely matched patients on a medical regimen showed that surgical treatment was definitely more effective in lowering the blood pressure, even if only temporarily; this was especially notable in the mild grade 1, moderate grade 2 and in malignant, or grade 4, hypertension but not too impressive in late benign, or grade 3, hypertension. Also, the 25 per cent sustained lowering of the blood pressure to normal or near normal levels by dorsolumbar sympathectomy is at least twice as good as the results obtained by a medical regimen plus the use of potassium thiocyanate in 100 cases.

IV. *Physiologic Effects, Disabilities and Dangers of Dorsolumbar Sympathectomy.*—It remains to inquire into the physiologic effects, the disabilities and the dangers of dorsolumbar sympathectomy. These may be the deciding factors in prescribing or withholding this procedure in patients with hypertension.

Immediately after the operation, especially after both sides are done, there is a profound and sustained fall in blood pressure which usually requires elevation of the foot of the bed and the administration of parenteral fluids including blood and of neo-synephrine hydrochloride intravenously. Recovery from this initial severe hypotension takes place in two to five days, but the hypotension may persist longer. Thereafter, sitting upright or standing may cause prompt disappearance of the blood pressure in the arm, an exceedingly rapid pulse, breathlessness, decided blanching, often coldness of the upper extremities and unconsciousness; in short, orthostatic hypotension with vasomotor compensatory adjustments. A tight elastic abdominal binder and tight elastic bandages on the legs will ameliorate or prevent these changes, especially if there is accompanying muscular activity (walking). These signs become somewhat less pronounced in the course of a day with periodic assumption of the upright position, and progressively less in the course of one to two months but may be recognized in some cases as long as two to three years after operative intervention. Tachycardia, breathlessness and a lightheaded feeling often are noted months or years later, when the subject has climbed a flight of stairs and pauses. The dilated minute vessels, one may suppose, add to the reservoir available for pooling of the blood. This is similar to the faintness of athletes on standing after a foot race. In the earlier period after surgical intervention the patients while sitting in a chair, reading or feeding themselves (minimal muscular activity in the lower half of the body) frequently have a white, gray or sallow pallor and lack tone in the facial muscles and eyelids; at times they have a slight *clouding or retardation of mentation, tachycardia* and breathlessness and coldness of upper extremities. These symptoms and signs are immediately relieved by the *recumbent position. The dyspnea and tachycardia* immediately on standing may be reduced by walking. The picture is that of a normal person suffering from "too many G's," or an uncompensated or incompletely compensated effect of gravity on the blood.

There are wide individual variations, but tolerance of the upright posture is developed the longer this posture is maintained. To raise the head of the bed during the hours of sleep reduces the intolerance noted more especially on rising in the morning. Most patients, though not all, can do without leg bandages in a few weeks and without an abdominal binder in two or three months. As noted previously, in the majority of this series (75 per cent), the blood pressure returns to hypertensive levels when the patient is followed three years or more, but in many instances there is a relative postural hypotension of some degree, an exceptional finding preoperatively. The less definite and persistent the hypotensive effect, the shorter is the period of convalescence and rehabilitation. It is concluded that a major effect of dorsolumbar sympathectomy in the majority of patients is pooling of the blood mass by gravity in the lower portions of the body. It is submitted that the objective signs of reduced strain clinically, in the electrocardiogram and in roentgenograms of the heart, may be related in part to pooling of the blood in dependent minute vessels with a diminished venous return during the two thirds of the day when the subjects are in the upright position. That the effect of the surgical operation is not primarily on the kidney is suggested by one observation. In a previously nephrectomized patient dorsolumbar sympathectomy on the side of the remaining kidney did not produce the characteristic relative postural hypotension or significantly modify the hypertension, but a noticeable lowering of the blood pressure occurred when the operation was performed on the other side three months later.

However, mechanical pooling of the blood mass by gravity may not be the only effect of dorsolumbar sympathectomy. Probably there is also an extensive reduction of vasomotor tone because: (1) there is an undoubted persistent and significant general reduction of the blood pressure level in a fourth of the patients; (2) this is noted most clearly and most frequently in those patients whose disease is considered on clinical grounds to have the largest vasospastic component

---

[5] In 211 cases of grade 1 hypertension the maximum diastolic pressure was never over 140 in 88 per cent. In 435 cases of grades 2, 3 and 4 the maximum diastolic pressures were more than 140 in well over 50 per cent. In general the same is true of extremely high systolic pressures. The maximum systolic pressures were over 220 in only 4 per cent of grade 1 but in nearly *two-thirds of cases* graded 2, 3 and 4. In short, as common sense dictates: the higher the pressure, the worse the case.

(grades 1, 2 and 4). Many of the patients show an improvement in the general level of the blood pressure, though not to normal or near normal levels (including all degrees of persistent improvement, perhaps 60 per cent). Infrequently does one see a patient who is apparently almost purely vasospastic. One such entered the hospital five years ago with a history of progressive loss of vision of five weeks' duration; he was found to have slight papilledema and a decidedly high blood pressure. On rest in bed his blood pressure, however, was at times normal. No intracranial lesion could be localized. He was sent out for observation in the outpatient department. His blood pressure again was persistently high: his papilledema persisted, and his vision grew worse. He again entered the hospital, and, in spite of the fact that a postural and cold test was strictly normal and there was no abnormal response to cold, he was sympathectomized. His blood pressure has been normal or near normal ever since. His vision is normal. Recently he has shown early partial auriculoventricular block in the electrocardiogram.

Those patients in this series who have been in frank congestive failure or who have had maximal renal impairment have died (6) or have continued in failure (3) with 1 exception. It has been found that heart failure and renal failure may advance in spite of an appreciable degree of relative postural hypotension and that coronary thrombosis, cerebral accidents, hypertensive crises and pronounced pressor responses (especially to mental stress) may occur subsequent to operative intervention. Nevertheless, there are certain patients with some loss of cardiac reserve who may show additional signs of failure while awaiting operation or between the two stages but who show remarkable clearing of all signs of failure (tachycardia, rales at the base of the lung, alternation and gallop rhythm) and no longer require digitalis after the second stage operation when the upright position is assumed during most of the day. Also it appears that there are some patients in frank heart failure prior to the operation, though they have not been encountered in this experience, who have been relieved completely of congestive heart failure by dorsolumbar sympathectomy for considerable periods of time.[6]

Complications of the surgical procedure are extrapleural fluid (relatively common), basal atelectasis (fairly common) and pneumothorax (infrequent). These conditions are usually dealt with easily. Postoperative pain in the back and neuritis are common, sometimes persistent, and require the use of salicylates or codeine or meperidine (Demerol) hydrochloride, hot fomentations and counterirritants. Backache or flank pain usually lasts a week or so to two months, not infrequently longer, and may be annoying for a year. For the operation, six to ten weeks' hospitalization is required, another six weeks to two months of convalescence and nine months to a year to feel perfectly well. The expense in discomfort, time and money (though not in risk to life) is comparable to having a coronary thrombosis. The relative postural hypotension with compensatory phenomena (tachycardia, breathlessness and possibly general vasoconstriction) may persist for months and may be disabling. One of the certain successes had the Raynaud's phenomenon of the feet relieved after operation but Raynaud's disease developed in the hands. Another patient, aged 28 years when operated on, who survived the operation five years with a much improved blood pressure before finally dying of a cerebral thrombosis, had had rather diffuse mottling of the skin of the extremities and slight Raynaud's phenomenon of the hands postoperatively. Within two months after surgical operation the Raynaud's disease of the hands was worse, and in three months early gangrene had appeared in one toe. The patient required bilateral upper dorsal sympathectomy and an additional lumbar sympathectomy for Raynaud's disease. It is not suggested that Raynaud's disease was caused by the operation but that general vasoconstriction compensatory to the relative postural hypotension definitely aggravated a preexisting tendency.

Other complications are indigestion and distention possibly due to vagal overactivity and aggravation or precipitation of gastritis or peptic ulcer with hemorrhage. However, the pathway of pain from the upper part of the intestinal tract is interrupted, so that perforation of or bleeding from a peptic ulcer may occur without a clearcut clinical picture. A number of these patients have had pyelonephritis. Several, 2 especially, have seemed to respond well but have been plagued by recurrent active pyelonephritis.

The effect on libido and potency in men is difficult to evaluate. Except as they are affected nonspecifically by hospitalization, discomfort and medication, dorsolumbar sympathectomy in itself probably does not affect libido and potency. Ejaculation, however, is stopped as a rule by removal of the first and second lumbar ganglions on both sides, but sterilization does not necessarily result. Precise data on this point by sperm counts are being sought.

The risk of the operation at the present time is presumably 2 per cent or less. Of the 21 deaths in this series, 3 may be considered operative deaths. In the beginning the procedure was offered to some patients in an extremely serious condition, especially to some with advanced renal impairment (4) who it is now known could not possibly have been benefited. In addition to the 3 operative deaths, 3 patients died of congestive heart failure, 4 of cerebral accidents, 2 of uremia and 9 of a cause unknown, presumably of their disease.

For whom should sympathectomy positively be prescribed? The one condition in which dorsolumbar sympathectomy not only is effective but also is the only hope of palliation is hypertension of pronounced degree especially with a decidedly high diastolic pressure and papilledema, namely grade 4, or malignant, hypertension, if renal or cardiac impairment is not severe and, as a rule, if frank heart failure is not present. To whom may sympathectomy be offered? Sympathectomy may be offered to those patients in whom the vasomotor element is most pronounced as evidenced by spontaneous variation, especially grade 1 hypertension, and to others with no more than slight renal impairment and without frank heart failure, grade 2. Operation may be offered especially if interval observations show that the actual levels of the blood pressure are growing worse, since in 226 patients with late grade 3 hypertension at least 19 per cent appeared to have advanced to this stage directly from mild grade 1 hypertension. The percentage may actually be higher, because it was impossible to know about the earlier stages in 23 per cent of the cases (in 24 per cent the hypertension appeared to have started at middle age with cerebral coronary or renal arteriolar disease, in 10 per cent it appeared to be related to precocious irreversible arterial and arteriolar sclerosis in young adults; 17 per cent of patients were graded 3 because of vascular accidents, the hypertension being of the senile wide pulse pressure sort and probably incidental). In general younger women seem to be especially favorable candidates for surgical intervention, but there are a few women at or just after the menopause in whom there develops a severe vasospastic state with hypertensive crises who may be much helped. Hypertension coming on in middle life in men, especially if brought to light by clinical evidence of arterial or arteriolar disease in the brain, the heart or the kidneys, does not seem as yet to be so certainly benefited by operative intervention. The progress of the disease may be delayed by the relative postural hypotension produced, but the diffuse arteriolar disease is not helped. Decision in regard to surgical treatment may result from balancing the prognosis against the expenditure in time and discomfort and the degree of disability produced.

---

[6] White, P. D.: Personal communication to the author

The surgical colleagues of the present hypertension research committee[7] of the Massachusetts General Hospital are employing different technics in an effort to reduce hospitalization while obtaining maximum benefits. For instance, one stage bilateral dorsal sympathectomy, from the third to the twelfth dorsal ganglions inclusive, has resulted in satisfactory relative postural hypotension and decided immediate improvement in a severely ill patient with malignant hypertension. A one stage bilateral dorsolumbar sympathectomy from the ninth dorsal to the first lumbar ganglions inclusive has been done. Finally certain patients with grade 1 vasospastic hypertension may well be offered one stage dorsal sympathectomy, which previously was found effective in some, which involves a shorter hospitalization and possibly less attendant disability and which may bring as much symptomatic relief. Lumbar sympathectomy may be added when as and if deemed desirable. For instance, 3 women are now under observation who had dorsal sympathectomies for early vasospastic hypertension ten or more years ago (2 in their twenties, 1 aged 33). One of these has had a strictly normal blood pressure; 1 has only a slightly elevated diastolic pressure; the third is definitely hypertensive but not severely so. Another had a dorsal sympathectomy for grade 2 hypertension at age 42, nine years ago. She is moderately hypertensive but works regularly as a nurse. A fifth patient operated on ten years ago by dorsal sympathectomy for a grade 1 menopausal hypertension at age 55 now has a decidedly high blood pressure and intermittent claudication, for which she had additional lumbar sympathectomies two years ago; but since the first operation she has been free from headache, as have all the others.

SUMMARY

A major effect of dorsolumbar sympathectomy in essential hypertension results from the relative postural hypotension, pooling of the blood in dependent parts and presumed decrease in venous return.

The duration of this effect varies widely, lasting from months to years, and accounts for much, if not the major part, of both the favorable effect on the disease and the considerable disability associated with the operation.

Compensatory vasomotor effects are orthostatic tachycardia and breathlessness, faintness, coldness of the hands (sometimes with the appearance of Raynaud's phenomenon), and infrequently the serious exacerbation of preexisting Raynaud's phenomenon so that additional operative intervention is required. The last mentioned is interpreted as compensatory vasoconstriction which seemingly does not involve (or involves less) the cerebral circulation as judged by relief of headache and improvement in eye grounds.

The orthostatic compensatory vasomotor effects are reduced and progressively minimized by elastic bandages on the legs, by an elastic abdominal binder and by time (presumably the functional development of peripheral vasoconstrictor centers and/or regeneration of the extirpated vasoconstrictor pathways). There is an improved tolerance in the course of each day from rising until retiring. This daily improved tolerance is cumulative. In addition to the relative postural hypotension a general reduction in the blood pressure level and presumably in the total vasomotor tone frequently is obtained.

When the favorable effect of operative intervention is critically evaluated (persistent reduction of the blood pressure to 150 systolic and 110 diastolic or below in all positions), it is found that in the present series there has been a diminishing return of favorable results the longer the patients are followed, nearly 70 per cent early in this experience, declining to 25 per cent when patients are followed three to five years or more. But this effect has been obtained twice as frequently in this series by surgical means as by a careful medical regimen and was obtained in patients with malignant hypertension whose blood pressures were unaffected by medical management.

In this series the patients with the most pronounced vasospastic elements were likely to receive the greatest benefit (grade 1 early variable and grade 4 malignant). Some patients with moderate benign hypertension, grade 2, without frank cardiac failure and without serious renal impairment were benefited. The patients with typical late benign hypertension, grade 3, with clinical evidence of irreversible diffuse arteriolar disease in brain, heart or kidneys were not benefited conspicuously; often they were plagued by a long disability to no purpose.

From this experience sympathectomy is regarded as the treatment of choice, at this time, for malignant hypertension and may be offered to patients with early or moderate vasospastic hypertension who have no clinical evidence of advanced, irreversible diffuse arteriolar disease. The factors of age and sex and the variations of blood pressure are discussed. To grade the degree of hypertension and to estimate the prognosis, interval observations over a period of time are necessary in almost all patients except those with malignant hypertension.

Prescription of operation for the patient with hypertension involves evaluation of the hypertension and attendant organic changes, the social and economic status and the personality of the patient and the objective of treatment (symptomatic relief, reduction of the blood pressure or halting the progress of the disease). Final judgment may depend on balancing the present status and estimated future of the patient with induced discomfort and disability.

GENERAL PRACTICE IN A LARGE HOSPITAL

M. H. MILLER, M.D.
Detroit

Since the establishment of the Section on General Practice in the American Medical Association in June 1946 many hospitals throughout the country have formed, or are in the process of forming, general practice sections. Mount Carmel Mercy Hospital, Detroit, has had such a section for eight years. It is felt that a description of the workings of this section, as well as an outline of the setup, might be of general interest.

When the regular active staff was organized, it was divided into four sections:

1. Medicine with its specialties.
2. Surgery with its specialties.
3. Obstetrics and gynecology.
4. General practice.

The chairman of each section, including general practice, conducts all meetings within his section. At the regular monthly section meetings there is a discussion of all deaths for the preceding month and of cases of unusual interest. Usually the chairman plans to bring out certain educational points or builds a scientific program around one or more of the cases.

In the general practice section the deaths are discussed in the open meeting, and the general practitioner whose case is under discussion is judged by other members of the section (also general practitioners). His errors, if any, may be pointed out to him. The chief of staff of the hospital may attend these meetings but does not participate unless asked to do so. In short, the general practice section does its own policing.

At all general practice section meetings the need of recognizing one's limitations is stressed, as is the need of postgraduate study. Men are asked about postgraduate work at frequent intervals, and men are asked to report, on their return, in the open meeting such work as they have done. Also they are reminded to complete their hospital records in a satisfactory manner and to keep their progress notes up to date. Consultation by members of the specialty staffs is urged in all major cases and in cases in which the outcome is in doubt.

The educational program is presented in the accompanying tabulation.

All members of the staff are required to have a 75 per cent attendance (except in case of prolonged illness) at all staff meetings, section meetings, clinical-pathologic conferences and educational program committee meetings. Attendance at the interns' meetings and journal club meetings is optional but well worth while, and many men attend voluntarily. Occasionally a member of the general practice group is asked to be a discusser at one of the interns' meetings or at a clinical-pathologic conference. Men who do not show an interest in the program may be reduced to a courtesy status or dropped by action of the executive committee.

The general practice section participates in the educational program committee conferences, taking an equal share with medicine, surgery and obstetrics and gynecology. Actually this means putting on ten meetings a year for the entire staff of the hospital. The chief of the division of general practice is responsible for this program. He makes plans for the whole year, securing speakers from outside the hospital staff (Wayne University or University of Michigan) for some of the meetings. For other meetings he may ask a member of one of the specialty staffs of the hospital to speak on a subject of interest to the general practice section. At one or sometimes two of the meetings the program may be put on by the general practice section itself. This has usually been in the form of a round table discussion. The chief of general practice conducts these meetings personally, introducing all the speakers.

The chairman and the secretary of the general practice section are elected at the September section meeting by popular vote of the members of the section. They hold office for one year. The chief of the division of general practice is an appointive office. The superintendent of the hospital makes the appointment on recommendation of the executive committee. The appointment is for one year but has at times been extended to two years. The chairman of the section is usually the man chosen for chief of the division, but not necessarily so. He may be any member of the general practice section.

The chief of the division of general practice is a member of the executive committee. He has an equal voice with the other department heads in the determination of hospital policies. He is the liaison officer between the general practitioner and the specialty groups. He makes recommendations to the executive committee on all men applying for staff appointments in the general practice section and is consulted in all matters of policy within the section. He makes recommendations for advancement of the members within the section according to the following outline:

Educational Program

	First Wednesday	Second Wednesday	Third Wednesday	Fourth Wednesday
8 to 9 a. m.	Interns' meeting	General staff meeting	Interns' meeting	Interns' meeting
9 to 10	Educational program committee conference	Clinical-pathologic conference	Educational program committee conference	Educational program committee conference
10 to 11	Surgical section meeting	Obstetrics and gynecology section meeting	Medical section meeting	General practice section meeting
11 to 12	Executive committee meeting	Medical journal club	Surgical journal club	Obstetrics and gynecology journal club

Attending: (A) Twenty years in practice. (B) Postgraduate work and interest shown in self improvement. (C) Professional ability and qualifications. (D) Attendance at meetings and interest shown in hospital work.

Associate attending: Fifteen years in practice plus foregoing.

Junior attending: Ten years in practice plus foregoing.

Assistant attending: Three or more years in practice plus foregoing.

Voluntary assistant: One year internship.

Members of the general practice section may hold dual staff appointments. They may receive appointments on the specialty staffs with a rating up to junior attending. Such an appointment usually comes through the chief of the division of general practice after consultation with the chief of the specialty division and is given in recognition of unusual ability and postgraduate work in a chosen field. It must, of course, have the approval of the executive committee. A man so appointed retains his membership in the general practice section. His activities in the specialty section are governed by the rules and regulations of that section.

Mount Carmel Mercy Hospital was opened on Jan. 16, 1939 as a 300 bed hospital. It now has 450 beds and 125 bassinets, with an average daily occupancy of 460. In the years 1939 to 1946 there were over 160,000 admissions. There have been over 25,000 obstetric deliveries in the hospital in eight years and over 57,000 surgical operations.

It is not possible to determine the exact role of the general practitioner in these statistics. The combined mortality rate of the general practitioners and the specialists compares favorably with that of hospitals of similar size throughout the country. Because of the fact that a large proportion of the general practitioner's surgery is minor or uncomplicated major surgery, his mortality rates are lower than that of any of the other divisions of the staff.

In obstetrics the general practitioner has been limited only by his ability, but no member of the general practice section attempts any major obstetric procedure without calling in a member of the obstetric staff. Often in these cases, if the particular general practitioner is qualified by training and experience to handle the procedure, the specialist merely stands by to advise or take over if the necessity arises. The general practitioner always bears in mind that the best interests of his patient are served when he stays within the limits of his ability.

No really seriously ill patient under the care of a general practitioner in this hospital is denied consultation by a senior member of one of the specialty staffs. Such consultation is furnished without charge if the patient is unable to pay.

The results of the educational program are apparent to the general practitioner himself. He feels that he is a better doctor than he was before he became a member of the staff. His education never ends, and he knows it. He must attend the scientific meetings and do outside postgraduate work to maintain his standing. But, best of all, he knows that he plays a part, however small, in the educational program and in the management of the affairs of his hospital.

Nowhere is there a finer spirit of understanding and cooperation between the general practitioner and the specialist. Many of the specialists have come to regard the general practitioner with new respect, and all the specialists have been amazed at some time or other to find the general practitioner abreast with the latest developments in the specialty fields. There isn't a specialist on the staff who, after eight years, regards the establishment of a general practice section a mistake.

Every hospital should be a teaching center, not only for residents and interns, but for staff members as well. There is no better way to reach the general practitioner for educational purposes than through the hospital in which he is permitted to care for his patients.

SUMMARY

The general practice section at Mount Carmel Mercy Hospital permits the general practitioner to work in a recognized hospital where his activities may be supervised if necessary, thereby acting in the best interests of the patient. It permits him to practice with pride and self respect. The general practice section stimulates interest in self improvement. It acts as a stepping stone for advancement to certain qualified men who have not had opportunities for long residencies.

All these things are made possible by the foresight of the men who drew up the original constitution and by-laws, the understanding cooperation of the Sisters of Mercy, the governing board of the hospital, the superintendent of the hospital and the specialists on the staff.

INTRATHECAL PENICILLIN

JAMES R. REULING, M.D.
Bayside, N. Y.
and
CHARLES CRAMER, M.D.
Jackson Heights, N. Y.

Penicillin has an irritative action on nerve tissue and may produce convulsions when applied in sufficient concentration to the cerebral cortex. Intrathecal penicillin has been used in single doses ranging from 5,000 to 100,000 units for the treatment of various inflammatory diseases of the meninges. As well as can be determined from a review of the literature, no larger single dose than 100,000 units has been used intrathecally, and no convulsions have been produced with such doses. The purpose of this article is to report a case of meningococcic meningitis in which the patient received (by error) a single massive dose of penicillin intrathecally and recovered after a series of generalized convulsions.

REPORT OF A CASE

History and Examination.—A white woman aged 27, married, four months pregnant, was admitted to Flushing Hospital in a comatose state. The past history was noncontributory except that she had had a slight "head cold."

On the day of admission, when her husband left for work in the morning she was apparently well. When he returned from work at 6 p. m. the patient complained of severe headache and of pain and stiffness in the neck. These symptoms continued, becoming progressively worse, and a few hours later she lapsed into semicoma and was admitted to the hospital in that state.

The essential physical observations on admission to the hospital were as follows: The temperature was 101 F. The patient was semicomatose, irrational and thrashing violently in the bed. The pharynx was red. Dried blood clots and mucopurulent material were present in both nostrils. The left ear drum was covered with fresh blood, but no perforation could be found. There was pronounced nuchal rigidity, and a bilateral Brudzinski sign was elicited. A positive great toe reflex was obtained on the right side.

Laboratory Data and Clinical Course.—Examination of the blood revealed 17,400 white blood cells with 90 per cent polymorphonuclears and 10 per cent lymphocytes. Urinalysis disclosed 1 plus albumin, and there was a slight trace of acetone. On spinal tap the fluid was cloudy, under increased pressure and contained 1,000 white blood cells per cubic centimeter, of which 98 per cent were polymorphonuclear cells. (The cell count probably represented a low value, because there were large pus clumps present in the fluid.) Smear of the spinal fluid revealed an occasional gram-negative intracellular diplococcus. Culture later revealed that the organism was a meningococcus.

The immediate treatment ordered was as follows: sodium sulfadiazine 4 Gm. intravenously, penicillin 40,000 units every three hours intramuscularly and 50,000 units penicillin in 10 cc. isotonic solution of sodium chloride intrathecally. The last medicament was prepared by the night supervisor and given at approximately midnight.

At 1 a. m. it was noted that the patient had twitching of the face and body and that the slightest noise in the ward or movement of the nurses caused a generalized twitching. At 5 a. m., five hours after the single massive dose of intrathecal penicillin, the patient had the first generalized clonic convulsion, which lasted thirty seconds. From 5 to 8 a. m. there were ten such convulsions. During this period a total of 6 grains (0.39 Gm.) of sodium phenobarbital and 4 grains (0.26 Gm.) of sodium amytal were given. After the third convulsion a large amount of mucus was suctioned from the throat. After the fifth convulsion the patient became incontinent of urine, and there was a slight amount of bloody vaginal show.

A word of explanation is indicated at this point: The day following admission, when the central supply office made their routine check of penicillin 450,000 units could not be accounted for. The night supervisor was contacted, and it was then discovered that she had prepared 500,000 units for the intrathecal injection and that that amount had been given. This was approximately fourteen hours after the intrathecal injection and six hours after the last convulsion.

A second spinal puncture was immediately ordered and showed a cloudy greenish fluid under increased pressure. Twenty-five cubic centimeters of fluid was withdrawn; the cell count was 2,100 with 98 per cent polymorphonuclear cells. Subsequent to this the patient began to show signs of improvement. Thirty-six hours after admission the temperature was 100 F., and thereafter it was normal.

After the series of convulsions the course was uneventful and recovery was rapid. The patient did not abort.

COMMENT

It was thought in the early stages of penicillin therapy applied to the nervous system that the convulsive manifestations might be due to impurities in the commercial penicillin. The work of Walker,[1] Johnson[2] and Kollros[3] seemed to show that the penicillin itself was the responsible factor. These investigators demonstrated that the intracortical injection of penicillin in man may give rise to electroencephalographic and clinical manifestations of seizures. It has been observed by Neymann[4] that the intraventricular and intracisternal injection of penicillin in man may induce a status epilepticus with a fatal outcome.

There appears to be little doubt that the dose of penicillin given intrathecally was the cause of the convulsions. Twitching and exaggerated reaction to noise and movements began one hour after the injection of intrathecal penicillin, and the first convulsion occurred four hours later. Furthermore, in our experience generalized clonic convulsions in meningococcic meningitis are exceedingly rare. Osler[5] has stated that except in early childhood convulsions are not common. Similar statements are made by Wilson[6] and Alpers.[7] It is perhaps significant that the convulsions ceased six hours before the second spinal tap removing the penicillin. One might speculate that the irritative phase of penicillin on the nervous system continues for a certain period and then ceases, or perhaps the dilution factor was sufficient after a time to lower the concentration of the antibiotic in the spinal fluid.

Reports of convulsions from the intrathecal use of penicillin are infrequent. The reason may be the amount used, since the recommended dose of 10,000 to 30,000 units intrathecally produces a concentration in the subarachnoid space around the cortex far below the convulsive threshold. However, it may be desirable to use larger single doses intrathecally in severe cases of meningococcic meningitis or, more especially, in the other types of pyogénic meningitis. We do not wish to give the impression that we are advocating single doses of 500,000 units of penicillin intrathecally, but much larger amounts than those considered safe at present can probably be given without convulsive seizures or other ill effects. Single doses of 100,000 units intrathecally have been used without convulsive tendencies.[8] The development of resistance to penicillin by pyogenic bacteria is known to be produced by the use of small (sublethal) doses. Therefore large initial doses given intrathecally may be advisable in some of the pyogenic meningitides. The rapid improvement and recovery of our patient suggested a beneficial therapeutic effect, even considering the fact that sulfadiazine also was administered.

While the recommended intrathecal dose of penicillin is from 10,000 to 30,000 units[9] for a single injection, recent reports seem to favor larger amounts, especially in the treatment of pneumococcic meningitis, in which the mortality is still high. Reitz[10] reported 8 cases of meningitis, 2 pneumococcic and 6 meningococcic, with no mortality. The 2 patients with pneumococcic meningitis and the critically ill patients with meningococcic meningitis received intrathecal penicillin, single doses of 100,000 units every twelve hours for three doses. One patient received two injections of 100,000 units each five hours apart and a third injection of the same amount the next day. No untoward reactions were noted. It is interesting to read the various opinions in the literature as to the dose for intrathecal use. The British investigators continue to use smaller amounts. Thus Jepson and Whitty,[11] in reporting 10 cases of pneumococcic meningitis with a mortality of 40 per cent from the meningitis, recommend "an immediate overwhelming intrathecal dose of penicillin" (10,000 to 20,000 units). Duthie and Cairns[12] stated that excessive dosage of 40,000 units and over at a single injection may produce fits or other severe cerebral reactions when injected into the ventricles or damage to the cauda equina or gumming of the subarachnoid space when injected by the lumbar route. Reports by investigators in this country do not substantiate these observations. We have used repeatedly 50,000 units for a single intrathecal injection in various types of meningitis without damage to the cauda equina or subarachnoid space. In the present case no residual damage to the cauda equina or other part of the nervous system was noted.

The question of pleocytosis produced by the use of intrathecal penicillin logically follows, and it also is a controversial subject. Rammelkamp and Keefer[13] reported headache, vomiting, increased intrathecal pressure and phagocytosis in the spinal fluid after the intrathecal injection of 10,000 units of penicillin in a normal subject. In probably the first case in which intrathecal penicillin was used Fleming[14] observed no clinical reaction, although there was evidence of some slight irritation by an increased emigration of polynuclear leukocytes. In a series of 12 cases of pneumococcic meningitis with 1 death, Waring and Smith[15] noted few ill effects. Adult patients complained in several instances of headache and nausea following intrathecal injection, but the patients did not show definite pleocytosis. In our case headache and nausea could not be determined because of the patient's condition, but there was no vomiting. It is reasonable to state that a definite pleocytosis was not produced by the intrathecal dose of 500,000 units, since the first cell count probably would have been considerably higher if the large clumps had not been present. Whether an irritative pleocytosis was produced but counterbalanced by a rapid decrease in the inflammatory reaction as a result of the large dose of penicillin cannot be determined.

Since medical science is constantly striving for simpler methods in the treatment of all diseases, it is not unusual to desire the elimination of intrathecal therapy of meningitis; if this goal cannot be reached, a minimal number of intrathecal injections would be the next most desirable thing. Furthermore, repeated spinal punctures increase enormously the chance of introducing infection from without.[12] Although Rosenberg and Sylvester[16] reported that under some conditions, such as acute inflammatory lesions of the meninges, penicillin might diffuse into the cerebrospinal fluid following systemic administration alone, there is good clinical evidence that the amount of penicillin that reaches the spinal fluid in bacterial meningitis is probably insufficient to control the infection.[17] Cases of meningitis have been noted in which the patient did not improve until penicillin was given intrathecally, and other cases have been reported in which meningitis appeared during the course of the intramuscular or intravenous treatment of extrameningeal infection. In these cases, likewise, no improvement took place until intrathecal therapy was instituted.

Tuberculosis Mortality in World War II.—Combined figures from the Office of the Surgeon General and the Veterans Administration, representing the tuberculosis mortality of the entire army group, including its discharged members, are now available. . . . This group, consisting of about 4 million men in 1942 and increasing to more than 11 million in 1945, had an average tuberculosis mortality of less than 4 per hundred thousand per year in 1942. The mortality increased to about 6 per hundred thousand per year in 1943 and to 10 in 1944 A slight rise was again evident in 1945, the last period for which figures are available, when the average mortality for members of the existing army and discharged men and women who had served in the Army from 1942 to 1945 increased to 12 per hundred thousand per year During this time the gross mortality rate for males of corresponding age in the United States fluctuated slightly but remained fairly constant at about 52 per hundred thousand population per year. The phenomenon observed is of great epidemiologic importance A group with a relatively low tuberculosis mortality rate at the start, but with a certain percentage of unrecognized cases in its midst, has shown a significant rise in its rate within a period of four years, at a time when the mortality rate of the population from which it was drawn has remained practically constant.—Long, Esmond R.: The Tuberculosis Experience of the U. S. Army in World War II, *Am. Rev. Tuberc.*, January 1947.

SYNTHETIC FOLIC ACID

The Effectiveness of a Conjugated Form in the Treatment of Tropical Sprue, Addisonian Pernicious Anemia and Nutritional Macrocytic Anemia

TOM D. SPIES, M.D.
Birmingham, Ala.
GUILLERMO GARCIA LOPEZ, M D.
FERNANDO MILANES, M D.
and
TOMAS ARAMBURU, M.D.
Havana, Cuba

Folic acid is the newest member of the vitamin B complex, and its therapeutic use in the treatment of pernicious anemia, nutritional macrocytic anemia and the macrocytic anemia of pellagra, pregnancy and sprue is bringing the fields of hematology and nutrition closer together. Folic acid occurs in nature in a free form and also as a part of various complexes. The following five substances have been isolated in crystalline form: (1) vitamin B^c; (2) Lactobacillus casei factor from liver; (3) L. casei factor from yeast; (4) another L. casei factor isolated from a fermentation residue, and (5) vitamin B_c conjugate.

Vitamin B_c, the L. casei factor from liver and the L. casei factor from yeast are identical with the synthetic product described by Angier and associates.[1] This compound is called pteroylglutamic acid and contains 1 molecule of glutamic acid. In contrast, the special L. casei factor isolated from the fermentation residue yields 3 molecules of glutamic acid. The vitamin B_c conjugate as reported by Pfiffner and his co-workers[2] yields 7 molecules of glutamic acid. If one may assume normal peptide linkages they can be written as shown in the accompanying illustration. These substances might well be designated respectively as pteroyldiglutamyl-glutamic acid (pteroyltriglutamic acid or fermentation L. casei factor) and pteroylhexaglutamyl-glutamic acid.

The studies on pteroylglutamic acid have been reviewed by Berry and Spies[3] and by Spies.[3a] Recently Spies and Stone have reported on the effect of pteroylhexaglutamyl-glutamic acid in treating addisonian pernicious anemia and nutritional macrocytic anemia in relapse.[4] Spies, working with a limited amount of the naturally occurring pteroyldiglutamyl-glutamic acid found it to be effective in treating addisonian pernicious anemia in relapse.[5] Suarez and his associates,[6]

University of Cincinnati Studies in Nutrition at the Hillman Hospital, Birmingham, Ala, and at the Calixto Garcia Hospital, Havana, Cuba In cooperation with the Department of Clinical Pathology of the University of Havana (Professors D. Ramos and J. Bisbe).

This study was aided by grants from the Martha Leland Sherwin Memorial Fund and from Lederle Laboratories, Inc.

Valuable technical assistance was given by Miss Jane Davis, Mrs Mary B. Koch, Mr. Tulio Martinez and Miss Flora Villate

The synthetic pteroyltriglutamic acid used in this study was received from Dr. Y. SubbaRow of Lederle Laboratories, Inc.

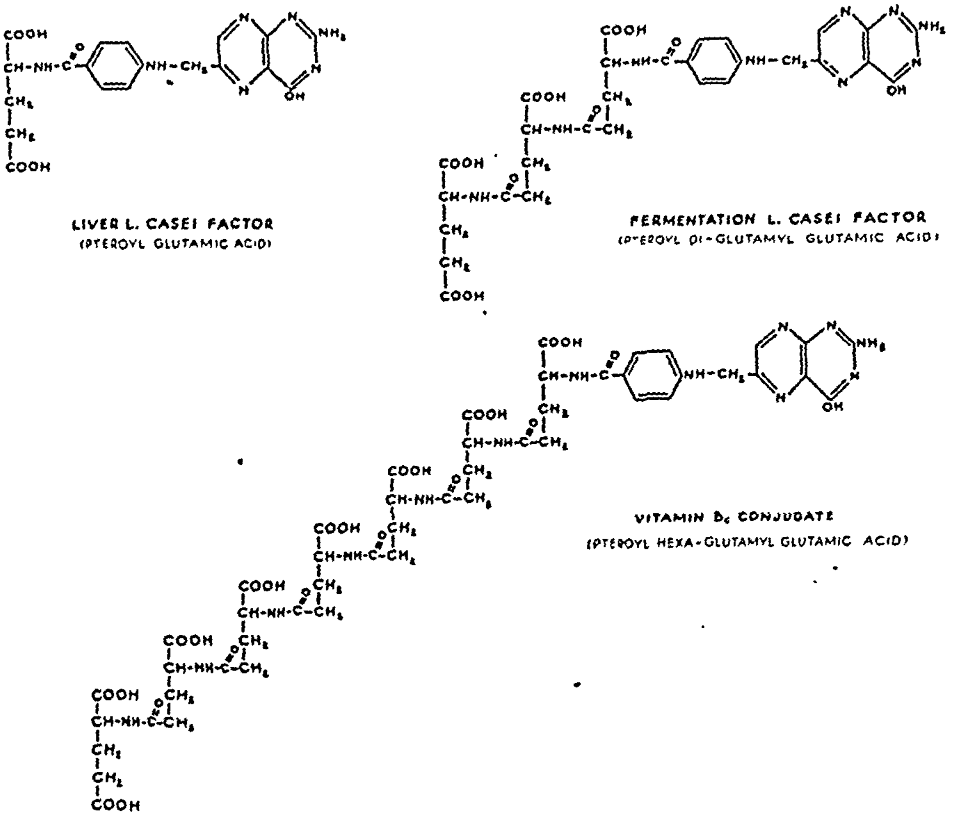
likewise working with a limited amount of the naturally occurring material, found it to be effective in treating a patient with tropical sprue.

The present report is concerned with a study on synthetic pteroyldiglutamyl-glutamic acid in the treatment of tropical sprue, addisonian pernicious anemia and nutritional macrocytic anemia in relapse. Methods of study were similar to those previously described.[7] The response to treatment is illustrated in the following case history.

REPORT OF A CASE

History and Examination.—M. G., a 55 year old Cuban man, was admitted to the Calixto Garcia Hospital on Nov. 21, 1946 complaining of extreme weakness and diarrhea. The onset of his illness was insidious. He said that he had been in poor health for a long time but could not state definitely for how long. Early in 1945 he began to lose weight and became progressively weaker. When he was admitted to the hospital in June 1945 his red blood cell count was 600,000. He was treated with extract of liver and given several transfusions of blood during the three months he was in the hospital. His blood values returned to normal, his appetite returned and he gained in weight. For six months after he was discharged from the hospital he felt perfectly well, although he received no treatment during this time. In February 1946 he suddenly began to have diarrhea consisting of from eight to ten semiliquid yellow stools a day. The bowel movements were preceded by cramping and pain in his intestines. Since he had no desire for food, and since food seemed to aggravate the diarrhea, he restricted his diet to liquid or soft foods such as milk, soup, cornmeal, rice and coffee. Occasionally he ate eggs and vegetables in small amounts. He became so weak he was unable to do any kind of work and was forced to stay in bed most of the time. His tongue became so sore that he frequently was unable to take any food but milk. He had cramping pains in his legs and a sensation of having sand in his eyes. Occasionally the diarrhea subsided for a few days and he felt better, but he continued to lose weight. By the time he came to the hospital eight months after the onset of the diarrhea, he had lost 30 pounds (13.6 Kg.).



LIVER L. CASEI FACTOR
(PTEROYL GLUTAMIC ACID)
FERMENTATION L. CASEI FACTOR
(PTEROYL DI-GLUTAMYL GLUTAMIC ACID)
VITAMIN B$_c$ CONJUGATE
(PTEROYL HEXA-GLUTAMYL GLUTAMIC ACID)

Assuming normal peptide linkage in the conjugated forms of folic acid, these two formulas could be written as shown.

The physical examination on admission showed an emaciated man who did not seem to be in acute distress but appeared to be extremely weak and apathetic. His skin was inelastic and had a lemon yellow tinge. The tongue was slick, and the papillae along the margin and at the tip were enlarged and hyperemic. His abdomen was distended with gas. The neurologic examination revealed nothing contributory.

Laboratory Data on Admission.—Examination of the blood revealed: red blood cell count 1.88 million; white blood cell count 3,700; hemoglobin 8.0 Gm. (52 per cent), and color index 1.4. Bone marrow studies showed maturation arrest at the megaloblastic level. Repeated gastric analyses showed hypochlorhydria with free hydrochloric acid after histamine stimulation. Stool analyses revealed acid steatorrhea. Oral glucose tolerance tests disclosed a flat curve.

On the basis of these laboratory and clinical findings, a diagnosis of tropical sprue was made.

Treatment and Course.—Two days prior to admission, the diarrhea subsided and the patient was having only two or three bowel movements daily. It was decided to keep him in the hospital for study under controlled conditions prior to the initiation of specific therapy. During this time his diet contained no meat, meat products, poultry, fish, eggs, milk, green vegetables or fresh fruits. It consisted only of bread, cornmeal, rice, potatoes, root vegetables and coffee. Determinations of the red blood cell count, white blood cell count, hemoglobin and reticulocyte levels were made daily. After fifty-nine days the red blood cell count was 1.32 million; white blood cell count 3,600; hemoglobin 6.6 Gm. (43 per cent), and reticulocytes 1.0 per cent. During this period of time the diarrhea of the patient did not increase in severity; he ate a diet containing approximately 1,500 calories a day, and his weight remained essentially unchanged.

Beginning on his sixtieth hospital day he was given 10 mg. of synthetic pteroyldiglutamyl-glutamic acid daily intramuscularly for eight days. On the fifth day of therapy the reticulocytes began to rise and reached a peak of 14.8 per cent ten days after the initiation of therapy. Five days later his red blood cell count was 2.43 million and the hemoglobin level was 9.0 Gm. (58 per cent). Clinical improvement paralleled the hemopoietic response. His appetite increased when his reticulocytes began to rise, and he began eating approximately 3,000 calories daily. His strength and feeling of well-being increased, and he began to gain in weight.

A similar hemopoietic and clinical response followed the administration of synthetic pteroyldiglutamyl-glutamic acid to 1 patient with addisonian pernicious anemia and to 1 with nutritional macrocytic anemia, who were treated in the Jefferson Hospital, Birmingham, Ala.

---

7. Spies, T. D.; Milanes, F.; Menendez, A.; Koch, M. B., and Minnich, V.: Observations on the Treatment of Tropical Sprue with Folic Acid, J. Lab. & Clin. Med. 31:227 (Feb.) 1946.

SUMMARY AND CONCLUSIONS

This communication reports the first patients with sprue, addisonian pernicious anemia and nutritional macrocytic anemia to whom synthetic pteroyldiglutamyl-glutamic acid, which is a conjugated form of folic acid, has been administered and found to be effective in producing a hematologic and clinical response. It must be kept in mind that there are many substances that may act similarly. This substance differs chemically from the L. casei factor (folic acid) in that it has 2 more molecules of glutamic acid and is not excreted so promptly in the urine of persons with macrocytic anemia as is the L. casei factor. Pteroyldiglutamyl-glutamic acid and the L. casei factor, if given in sufficient amounts, are capable of producing a hemopoietic remission. Although we gained the distinct impression that, milligram for milligram, the response to synthetic L. casei factor is greater than that to the conjugated form, this observation is particularly significant in view of the fact that so much of the folic acid in nature occurs in the conjugated form and that Suarez,[6] Bethell[8] and Spies,[4] with their associates, have shown that many patients with macrocytic anemia are unable to convert the vitamin B_c (a conjugated form) to free folic acid. All investigators in the field have been concerned with a satisfactory explanation for the fact that a large amount of folic acid or related compounds is required to produce a satisfactory hemopoietic response, whereas relatively little of the active substance of a potent extract of liver is required.

Clinical Notes, Suggestions and New Instruments

PANCREOLITHIASIS AND CHRONIC PANCREATITIS

Preliminary Report of a Case of Apparently Successful Treatment by *Transthoracic Sympathectomy and Vagectomy*

WILLIAM FRANCIS RIENHOFF Jr., M.D.
and
BENJAMIN M. BAKER, M.D.
Baltimore

This preliminary report is made in order that the method of treatment herein described may be called to the attention of those interested in the alleviation of the symptoms of chronic pancreatitis and pancreolithiasis. Up to the present all therapeutic methods employed, either medicinal or surgical, have been unsuccessful from the point of view of the relief of pain, which constitutes the essential disabling factor in this clinical syndrome. Various surgical procedures have been carried out for relief of this excruciating pain, and all have been essentially unsuccessful. These procedures consisted of partial or complete pancreatectomy, ligation of the pancreatic ducts and various operations on the biliary tract.

In the patient whose treatment forms the basis of this report, an unsuccessful result was obtained from a partial pancreatectomy, plus ligation of the duct of Wirsung, performed in 1939. After bilateral transthoracic vagectomy and sympathectomy performed in April 1946, the patient has been completely free of pain, has gained 60 pounds (27 Kg.) and has now returned to his former business, apparently asymptomatic. A complete report with illustrations and laboratory data will be published later. A brief résumé of the clinical history is as follows:

P. D., a white man aged 35, was first admitted to the Johns Hopkins Hospital Sept. 16, 1939, with the complaint of severe pain in the epigastrium which came on after meals, particularly in the afternoon and evening. This pain was accentuated by taking food. Because of the increased severity of the pain the patient sought relief by drinking whiskey, which seemed to alleviate his discomfort. Up to this time he had been an active intelligent business man, but he became addicted to alcohol, his daily consumption being between 2 and 3 quarts (1.9 and 2.8 liters) of whiskey, which interfered with his life socially and in a business way.

He was admitted to a sanatorium for the treatment of alcoholism, and during the routine examination it was found that he had severe diabetes mellitus and was strikingly emaciated because of the fact that ingestion of food caused him to have severe pains; he was thought to have in addition a psychopathic personality. Laboratory examination revealed that the level of sugar in the blood was constantly elevated above 200 mg. per hundred cubic centimeters, and that there was 4 plus sugar in his urine. Also, the roentgenograms of his abdomen revealed the presence of calculi in the head and tail of his pancreas. While in the sanatorium the patient had several attacks of delirium tremens. Except for being treated for his diabetes he was discharged relatively unimproved, whereupon he was transferred to the Johns Hopkins Hospital on the medical service of Dr. John T. Howard and later of Dr. Louis Hamman. The clinical and laboratory observations were essentially the same as those revealed in his previous examination in the local sanatorium to which he was primarily admitted.

An exploratory celiotomy was performed by W. F. R. Sept. 25, 1939, at which time the pancreas was found to be the site of a severe chronic inflammatory lesion associated with diffuse localized areas of calcification. The organ as a whole was extremely hard and decreased in size; it seemed to be definitely atrophic. Incision was made in it along the probable course of the duct of Wirsung, and the substance of the gland was found to be everywhere hard and gritty, due to scar tissue with many small areas of calcification. The pancreatic duct was finally, after much difficulty, isolated and found to be dilated proximal to a stone about 3 mm. in diameter, which was removed from the duct. The duct was ligated, and a portion of the body of the pancreas was removed. The patient had an uneventful convalescence and recovered from the operative intervention, but no amelioration of his signs or symptoms followed. The patient had seven successive admissions to the Johns Hopkins Hospital from 1939 to April 1946, when he was admitted on the service of Dr. Hamman. At this time the emaciation of the patient was extreme and his diabetes was far worse; he had drunk increasing amounts of whiskey, had smoked two to three packs of cigarets a day and had over a period of years become a pronounced morphine addict. At one time his daily consumption of morphine and Pantopon (the total alkaloids of opium as soluble hydrochlorides) amounted to 20 grains (1.3 Gm.) in twenty-four hours. Previous to the final operation the patient had several attacks of delirium tremens. In addition to previous laboratory findings his stools were now voluminous and fatty, suggesting decided pancreatic deficiency.

Transthoracic vagectomy and sympathectomy were performed on April 8, 1946, at which time the sympathetic trunk from the fifth thoracic to the second lumbar ganglion was removed transthoracically, including the greater, lesser and least splanchnic nerves and the celiac ganglion on the left side. The right and left vagus nerves were also resected above the diaphragm for a distance of 3 cm. Subsequent to this surgical procedure there was pronounced improvement in the clinical condition. The pain seemed to be less. On April 24 transthoracic sympathectomy on the right side was performed, the sympathetic trunk, again from the fifth thoracic to the second lumbar ganglion, including the greater and lesser splanchnic nerves and the celiac ganglion, were removed.

The patient had an uneventful convalescence, improved remarkably during his hospital stay and was discharged May 5 to return to his home to complete his convalescence.

A letter from Dr. R. H. Crawford of Rutherfordton, N. C., dated Feb. 26, 1947, stated: "I saw patient at the hospital yesterday, he is tremendously improved, is entirely free of pain —he has not taken any narcotics for the past six months." A complete report of Dr. Crawford's record will be incorporated in a more detailed description of the case in a later report.

---

8. Bethell, F. H.; Swendseid, M. E.; Bird, O. D.; Meyers, M. C.; Andrews, G. A., and Brown, R. A.: Observations on the Utilization of Folic Acid (Vitamin Bc) and Vitamin Bc Conjugate by Persons with Pernicious Anemia and Macrocytic Anemia Following Gastrectomy, Univ. Hosp. Bull., Ann Arbor **12**: 42 (May) 1946.

Suffice it to say that the patient has gained 60 pounds (27 Kg), his personality has returned to normal, he is taking nothing alcoholic to drink and he has had no narcotics of any sort for six months. Photographs of him taken in 1940 and in 1947 show the most extraordinary physical improvement. These will be incorporated in a forthcoming article.

It is necessary for him at present to take 40 units of protamine zinc insulin and 10 units of regular insulin each day, and as a result of this his urine has remained free of sugar. On Feb. 25, 1947 the level of sugar in his blood was 250 mg. per hundred cubic centimeters. He takes two tablets of triple strength pancreatin after meals.

CONCLUSION

This patient would seem to present incontrovertible evidence that pain, the main disabling symptom of chronic pancreatitis and/or pancreolithiasis, can be alleviated by severance of the autonomic fibers supplying the pancreas. The rationale of the operation was: first, all or any afferent fibers from the pancreas would be cut if complete sympathectomy and vagectomy were performed; second, interruption of both the sympathetic and parasympathetic paths would be necessary because of their many and frequent anastomoses and was the only procedure which would insure interruption of such afferent paths; third, although the physiologic action of the autonomic systems of the pancreas in the human being is not completely known it may be assumed that the secretory function, as far as the external secretions are concerned, would probably be reduced as a result of the severance of the parasympathetic and sympathetic nerves leading to the pancreas. The origin of pain would seem to be due to the secretion of pancreatic juices into the ducts blocked by the cicatrization and calcification of the small tributaries of the larger ducts of Wirsung, these secretions thereby producing distention of the obstructed channels or ducts. Secretion of the denervated pancreas probably is decidedly reduced after severance of the autonomic nerve.

Before definite conclusions can be drawn, of course, more patients must be so treated. In proportion to the magnitude of the operation transthoracic sympathectomy and vagectomy is a relatively simple procedure as compared to pancreatectomy or any of the modifications thereof. It would seem that this patient has been restored to his normal activities, while it is true that he is dependent on insulin, and probably will be for an indefinite period, it is also recognized that the self-imposed starvation, alcoholism and addiction to drugs initiated to combat the excruciating pain of his disease were responsible for his total physical incapacity.

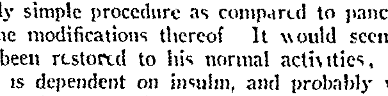
Council on Pharmacy and Chemistry

NEW AND NONOFFICIAL REMEDIES

The following additional articles have been accepted as conforming to the rules of the Council on Pharmacy and Chemistry of the American Medical Association for admission to New and Nonofficial Remedies. A copy of the rules on which the Council bases its action will be sent on application.

Austin Smith, M.D., *Secretary*

NITROFURAZONE.—5-nitro-2-furaldehyde semicarbazone—$C_6H_6O_4N_4$—M. W. 198.15. A synthetic antibacterial substance derived from furfural, possessing the following structural formula:



Actions and Uses—Nitrofurazone is a substituted furan compound possessing bacteriostatic and bactericidal properties; it is inhibitory in solutions with concentrations of 1:200,000 to 1:300,000 and bactericidal at 1:50,000 to 1:75,000. It is not soluble in much less than 5,000 parts of water. It is effective in vitro and in vivo against a variety of gram negative and gram positive bacteria; it has least bacteriostatic activity against Bacillus pyocyaneus and little bactericidal effect on Diplococcus pneumoniae.

Nitrofurazone is useful for topical application in the prophylaxis and treatment of superficial mixed infections common to contaminated wounds, burns, ulceration and certain diseases of the skin. It may be useful as an adjunct to surgery in the preparation of areas for skin grafting and in the treatment of osteomyelitis. Daily application for periods of one month or longer may produce a local reaction in a small percentage of cases. Sensitivity or intolerance to its local use has been occasionally observed and may be cause for its discontinuance. Because of this, continuous applications for periods as long as five days may be capable of producing sensitization. Photosensitization from sunlight has not been encountered. Variant bacterial strains showing induced resistance to sulfathiazole, penicillin or streptomycin are as susceptible to nitrofurazone as their parent strains. Induced resistance to the aforementioned agents does not entail resistance to nitrofurazone.

Systemic toxicity due to absorption of the compound is considered unlikely. Clinical studies indicate that the ingestion of 1 to 3 Gm. daily for long periods is fairly well tolerated by the majority of human subjects, but until more conclusive evidence of its mode of action and chemotherapeutic value becomes available its internal use cannot be recommended.

Dosage.—Nitrofurazone is used topically in an ointment-like base containing a concentration of 1:500 (0.2 per cent). It is applied locally either directly or to dressings that cover the infected area. The base is water soluble but liquefies at body temperature and may thus require special coverings to maintain effective contact with certain areas to which it may be applied. Dressings may be reinforced with cellophane or similar material, and petrolatum gauze may be used for a barrier to limit the absorption into the dressing. On exposure to light, the bright yellow nitrofurazone turns dark brown. This is not associated with any ill effects and may be avoided by covering with light dressings.

Tests and Standards—

Nitrofurazone occurs as an odorless, lemon yellow colored crystalline powder, which turns brown black and decomposes at from 236 to 240 C. It is nearly tasteless but develops a bitter after taste. It is slightly soluble in alcohol (1:590), in propylene glycol (1:350) and in polyethylene glycol mixtures, very slightly soluble in water (1:4,200), practically insoluble in ether. The crystals tend to darken on prolonged exposure to light.

When dissolved in water, nitrofurazone exhibits light absorption maxima in the ultraviolet region at 2,600 angstroms and at 3,750 angstroms, with a minimum at about 3,060 angstroms (1 mg. per hundred cubic centimeters).

Place about 10 mg. of nitrofurazone in a test tube, add 5 cc. of water and 5 cc. of 10 per cent sodium hydroxide solution: the nitrofurazone dissolves and the solution is colored dark orange red.

Place about 50 mg. of nitrofurazone in a 50 cc. flask, add 1 Gm. of granular zinc, 10 cc. of alcohol and 20 cc. of dilute sulfuric acid. Heat on the steam bath: the nitrofurazone dissolves slowly and the solution becomes practically colorless.

Transfer about 1 Gm. of nitrofurazone to a stoppered cylinder and add 100 cc. of water. Shake the cylinder and contents for fifteen minutes and allow the solid to settle: the pH of the supernatant solution is in the range 6.0 to 6.5.

Dry about 0.5 Gm. of nitrofurazone, accurately weighed, at 100 C. for one hour: the loss in weight does not exceed 0.1 per cent.

Char about 0.5 Gm. of nitrofurazone, accurately weighed, cool, moisten with sulfuric acid and finally ignite: the residue does not exceed 0.05 per cent.

The nitrogen content of nitrofurazone, as determined by the Dumas micro method, is not less than 28.1 per cent nor more than 28.6 per cent.

Weigh accurately about 10 mg. of nitrofurazone, transfer it to a 1 liter volumetric flask and dissolve the solid in about 50 cc. of aldehyde-free alcohol. Fill to the mark with water, mix and determine the optical density, E, of this solution and also that of several dilutions such as ¾, ⅔ and ½ respectively of the original concentration, at 3,750 angstroms. Use a comparison solution made by mixing 5 cc. of the aldehyde free alcohol with 95 cc. of water. Calculate the $E\frac{1\%}{1\ \text{cm}}$ for nitrofurazone from the data obtained: the E values observed are a linear function of the concentration and the $E\frac{1\%}{1\ \text{cm}}$ values, calculated for each concentration, yield an average value of 795 (± 2%).

Eaton Laboratories, Inc., Norwich, N. Y.

Furacin Soluble Dressing 1:500: 113 Gm. and 454 Gm. jars. Each hundred grams contains Furacin 0.2 Gm., Carbowax (1,530) 30 Gm., Carbowax (4,000) 15 Gm. and polyethylene glycol (300) 54.8 Gm.

U. S. patent 2,319,481 (expires 1962). U. S. trademark 403,279.

CHINIOFON (See New and Nonofficial Remedies, 1946, p. 262).

The following dosage form has been accepted:

Abbott Laboratories, North Chicago, Ill.

Enterab Chiniofon Tablets: 0.25 Gm. Each tablet is enteric coated with a resin prepared from stearic acid, phthalic anhydride and glycerin.

U. S. trademark 353,674.

THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION

535 North Dearborn Street - - Chicago 10, Ill.

Cable Address - - - - "Medic, Chicago"

Subscription price - - - - : Eight dollars per annum in advance

Please send in promptly notice of change of address, giving both old and new; always state whether the change is temporary or permanent. Such notice should mention all journals received from this office. Important information regarding contributions will be found on second advertising page following reading matter.

SATURDAY, MAY 3, 1947

THE CENTENNIAL SESSION

Featured in this issue of The Journal is the program of the Centennial Session of the American Medical Association. Already there are indications that the attendance will rival that of any other meeting ever held in the history of the organization. The significance of the occasion has been marked by the issuance of a stamp by the Post Office of the United States commemorating the hundred years. These stamps will become available on June 9 at the time of the annual session. Another feature of the centennial is the publication of the "History of the American Medical Association," a book of some twelve hundred pages, with many illustrations. There is now definite assurance that this book will be available at the session.

Gen. Omar N. Bradley

Some of the unusual features of the program have been referred to previously in issues of The Journal. On Saturday, June 7, the Board of Trustees of the American Medical Association is tendering a dinner to honor the affiliated professions, industries and leaders in American life. The chairman of the Board of Trustees will preside. Addresses will be given by Gen. Omar Bradley, director of the Veterans Administration; Mr. Basil O'Connor, chairman of the American Red Cross and president of the National Foundation for Infantile Paralysis, Inc., and Mr. H. W. Prentis Jr., president of the Armstrong Cork Company, Lancaster, Pa., and past president of the National Association of Manufacturers. Arrangements are under way for broadcasting these three addresses on a national network.

On Sunday, June 8, at 11:30 in the morning a special religious service will be held in the Convention Hall in Atlantic City. There will be an organ recital followed by addresses given by Dr. Ralph Cooper Hutchison, Rabbi Joshua Liebman and Monsignor Fulton J. Sheen. From 11 to 11:30 a. m. the three speakers will broadcast over N. B. C.

On June 9 will come the official opening of the Technical and Scientific exhibits. This year attempts have been made to register by mail as many as possible of the physicians who plan to attend the session so as to avoid the congestion at the registration desk. Those who have been previously registered will need merely to present a card with a number that has been given to them; they will then be provided with the necessary programs, badges, guest cards and other informational material.

Basil O'Connor

On Monday afternoon, June 9, the first of the General Scientific Meetings will be held, as described in the program printed elsewhere in this issue. Our distinguished foreign guests who will participate in the program of Monday afternoon and Tuesday morning and afternoon include Professor George W. Pickering of London, Professor Herbert John Seddon of Oxford and Sir Howard Florey of Oxford.

For the Opening General Meeting on Tuesday night, which will be held in the Convention Hall, music will be provided by the Philadelphia Festival Orchestra conducted by Alexander Hilsberg. The address will be delivered by Dr. Edward L. Bortz, who has succeeded to the position of President-Elect of the American Medical Association, following the resignation of Dr. Olin West. The Distinguished Service Medal of the Association will be awarded. The retiring President, Dr. Harrison H. Shoulders, will receive the President's Medal, and the distinguished foreign guests will be introduced.

The scientific programs of the sections begin on Wednesday morning, June 11. In each of the sections a special paper will deal with a hundred years of progress in that medical or surgical specialty. Some hundreds of papers and a considerable number of symposiums are included, with a distinguished foreign guest on the program of each one of the scientific sections. Three special meetings will be held under the auspices of the Section on Miscellaneous Topics: the Session on History of Medicine, Session on Physical Medicine and Session on Allergy,

H. W. Prentis Jr.

Special attention is called here to the sessions of the Section on Preventive and Industrial Medicine and Public Health. Because of the increasing interest in the field of industrial health, the officers of this section have been at special pains to develop an unusual, timely and interesting program.

Attention is called also to a joint session of the Section on Internal Medicine and the Section on Experimental Medicine and Therapeutics on Friday, June 12, which will be devoted to the subject "What's New in Medicine." Other symposiums will cover such subjects as Cancer Research, Virus Diseases, Therapeutic Abortion, Liver Disease and Ulcerative Colitis.

Dr. Ralph C. Hutchison

Wednesday night has been assigned to meetings of alumni associations, fraternities and similar groups.

On Thursday night, June 12, a reception will be tendered to the retiring President, the President and the President-Elect of the Association and of the Woman's Auxiliary, and also to the distinguished foreign guests. This reception will be held in the Ballroom of the Convention Hall, where two well known orchestras will provide the music for this occasion.

The Technical Exhibit and the Scientific Exhibit are by far the largest that have ever been arranged for an annual session of the American Medical Association. Every one of the leading industries related to the practice of medicine has arranged an exhibit, and special attention will be given in these exhibits to reflecting scientific progress in the field concerned. Special exhibits in the Scientific Exhibit will concern fractures, cardiovascular diseases and physical medicine.

Rabbi Joshua Loth Liebman

Throughout the week the Woman's Auxiliary will be holding the regular sessions of its representative body. The Woman's Auxiliary of the Association now includes more than 30,000 members.

The entertainment scheduled for this annual session guarantees to all who attend a week not only of intellectual and spiritual enrichment but also of relaxation. As has been customary in other recent meetings of the Association, there is featured on this occasion an exhibit of art including painting, etching and sculpturing by physicians under the auspices of the American Physicians' Art Association. Prizes are to be given for those who present concepts most clearly exemplifying the services of the American physician in war.

Msgr. Fulton J. Sheen

The convention city is noted for its Boardwalk and its location as an oceanside resort. The American Medical Golfing Association is planning a tournament which will no doubt utilize the available excellent golf courses in or near Atlantic City. Several of the great industries are planning cocktail parties, dinners and suppers which will feature this Centennial celebration.

Already the reservations of rooms in the Boardwalk hotels and those closely adjacent are taxing the capacity of the convention city. Excellent rooms are available in other hotels and in neighboring cities and villages, so that any one who wishes to participate need not fear the overcrowding. A request for reservation should be sent immediately to the chairman of the Subcommittee on Hotels, Dr. Robert A. Bradley (16 Central Pier, Atlantic City, N. J.) indicating the type of room that is desired.

THE TEACHING OF NUTRITION—II

From its earliest beginnings as a specialty pediatrics never has been concerned exclusively with treatment of the sick. The concept of preventive pediatrics and maintenance of health has been assigned an important part in pediatric practice. Nutrition has always been a prime factor in attaining the objectives of this specialty. Always the pediatrician has been expected to give scientific advice concerning the feeding of infants. Our modern knowledge of nutrition demands much more than just the feeding of infants.

The future of the human race depends on rearing healthy children. Growth, development and health are dependent on adequate nutrition. The physician must be well equipped to guide nutrition of the child. Rules of thumb cannot serve adequately; specialized knowledge is essential. The physician must know about normal nutrition for the maintenance of health. He must know about nutrition in disease so that recovery may be hastened.

While the basic facts of nutrition usually are given in courses other than pediatrics, nutrition must be taught as such in pediatric training. As in physiology, anatomy and chemistry, so also in nutrition the concrete and special application to the patient is often more impressive to the student than the abstract learning gained from the preclinical courses.

Although the teaching of nutrition has always been an integral part of pediatric teaching, such teaching was largely empirical until the last two decades. Now the teaching of nutrition is based firmly on knowledge. The great mass of information on nutrition obtained through the study of animals has been supplemented and augmented by studies of well and sick infants and children. These studies have been integrated with chemical and anatomic studies of growth and development. For example, knowledge of the rate of growth of the skeleton at various ages of infancy and childhood is of real assistance in determining the calcium requirement at any given age.

Nutrition in pediatrics includes much more than giving the required amounts of appropriate foods in health. It requires understanding of metabolic changes in disease and compensating for these changes. The treatment of severe diarrhea, for example, requires knowledge of the salt and water metabolism of the body, of the factors required for replacement of the losses and of the practical application of the principles involved. Only recently has it become known that it is as important to supply lost potassium as it is to replace sodium and chloride if a baby is to recover from diarrhea. Also parenteral alimentation becomes necessary in diarrhea when the condition is severe and prolonged. In this situation detailed knowledge of maintenance requirements is necessary not only for water and salts but also for protein, energy and vitamins. Knowledge of proper use of protein hydrolysates is relatively new and in fact still incomplete.

Nutrition in pediatrics as in all other fields is constantly advancing. The instructor must keep up with these advances so that his teaching may be modern. Advances in nutrition are too many and too rapid to permit a teacher to maintain a static state of knowledge and be successful.

In the teaching of pediatrics some didactic instruction is necessary, but didactic training must be fully supplemented by opportunity for practical application. Instruction in infant nutrition, for example, has little meaning to the student until he is confronted with the responsibility of feeding a baby. The student will have the fullest training opportunity when he becomes an intern, but he should have as much opportunity as possible while still a student.

Demonstrations often are more effective in teaching than the giving of abstract information. While demonstrations in nutrition are more difficult than in some other fields, opportunity exists for many that are useful. When the infant or child is used as the subject for discussion, interest is maintained more easily and the discussion makes a greater impression.

Along with the teaching of nutrition in pediatrics, an understanding of the psychology of feeding has an important place. Many a child is undernourished because of chronic anorexia induced by mismanagement at meal time and emotional stresses associated with food and feeding. The teaching of nutrition in pediatrics must include the related psychologic aspects and the effect of emotional factors on eating. For the undergraduate medical student such teaching may of necessity be largely by didactic discussion. For the intern and resident staff, knowledge of these related factors is to be gained through responsibility for the care of patients and the easy availability of experts in the fields of dietetics and psychology or psychiatry. Presence of a dietitian and psychologist on regular ward rounds is helpful in this respect. The nutrition of the child should be discussed in relation to his disease, to his rehabilitation and to his home environment.

Current Comment

THE DISTINGUISHED SERVICE MEDAL

The Distinguished Service Medal, one of the highest awards within the gift of the American Medical Association, will be presented for the tenth time at the General Meeting of the Centennial Celebration at Atlantic City, Tuesday evening, June 10. The method of selecting the recipient of the Distinguished Service Medal is specifically defined in the By-Laws. Any Fellow of the Association may submit nominations, which should be sent, together with a record of the nominee's medical career and the reasons why he should be considered for the award, to the Chairman of the Committee on Distinguished Service Awards, Dr. William Weston, 1428 Lady Street, Columbia, S. C. The committee considers all nominations received, and from the total number of names received it submits five to the Board of Trustees. From those five the Board of Trustees selects three, which its chairman presents to the House of Delegates immediately after it has assembled for its first meeting. The House makes the final selection by ballot. Those who have received the Distinguished Service Medal of the A. M. A. have been physicians of distinction associated with the progress of medical science and with scientific discoveries of great importance. The first presentation was made to Dr. Rudolph Matas of New Orleans in 1938. Subsequent awards were made to Dr. James B. Herrick of Chicago in 1939, to Dr. Chevalier Jackson of Philadelphia in 1940, to Dr. James Ewing of New York in 1941, to Dr. Ludvig Hektoen of Chicago in 1942, to Dr. Elliott P. Joslin of Boston in 1943, to Dr. George Dock of Pasadena, Calif., in 1944, to Dr. George R. Minot of Boston in 1945 and to Dr. Anton J. Carlson of Chicago in 1946. Obviously, an extensive list of distinguished physicians nominated for the award will enable all concerned to determine a recipient whose selection will reflect honor not only on himself but also on the American Medical Association. Nominations should be received by Dr. Weston not later than May 15.

BILLS INTRODUCED TO RAISE ARMY PHYSICIANS' PAY

Bills were introduced in the Senate and House April 22 and April 23 respectively to increase the pay of medical officers of the Army. The differential between the income of civilian doctors and that of medical officers in the service probably has much to do with the fact that fewer medical officers are in the regular Army today than before the recent war began. The Army is having difficulty in attracting sufficient medical officers to fill even the present quota allowed by Congress. Should Congress provide increased pay for medical officers and should plans of the War Department go through to allow medical officers to spend more of their time in professional work the military service would become more attractive to well qualified young doctors. It is obviously proper that men who have given special attention and time to prepare themselves for advanced medical work should have this increased recognition.

THE CENTENNIAL CELEBRATION

AMERICAN MEDICAL ASSOCIATION, NINETY-SIXTH ANNUAL SESSION

ATLANTIC CITY, N. J., JUNE 9-13, 1947

OFFICIAL CALL

TO THE OFFICERS, FELLOWS AND MEMBERS OF THE AMERICAN MEDICAL ASSOCIATION

The ninety-sixth annual session of the American Medical Association will be held in Atlantic City, June 9-13, 1947.

The House of Delegates will convene at 10 a. m. Monday, June 9. In the House the representation of the various constituent associations for 1947, 1948 and 1949 is as follows:

Alabama	2	Nevada	1
Arizona	1	New Hampshire	1
Arkansas	2	New Jersey	5
California	9	New Mexico	1
Colorado	2	New York	20
Connecticut	3	North Carolina	3
Delaware	1	North Dakota	1
District of Columbia	2	Ohio	7
Florida	2	Oklahoma	2
Georgia	3	Oregon	2
Idaho	1	Pennsylvania	10
Illinois	9	Rhode Island	1
Indiana	4	South Carolina	1
Iowa	3	South Dakota	1
Kansas	2	Tennessee	2
Kentucky	2	Texas	5
Louisiana	2	Utah	1
Maine	1	Vermont	1
Maryland	2	Virginia	2
Massachusetts	6	Washington	2
Michigan	5	West Virginia	2
Minnesota	4	Wisconsin	3
Mississippi	1	Wyoming	1
Missouri	4	Alaska	1
Montana	1	Hawaii	1
Nebraska	2	Isthmian Canal Zone	1
		Puerto Rico	1

The scientific sections of the American Medical Association, the Medical Corps of the Army, the Medical Corps of the Navy and the Public Health Service are entitled to one delegate each.

The Scientific Assembly of the Association will open with the General Scientific Meetings to be held Monday, June 9, starting at 2 p. m. and continuing throughout the morning and afternoon of Tuesday, June 10. The General Meeting at which the President will be installed will be held on Tuesday, June 10, starting at 8 p. m. The sections will meet Wednesday, Thursday and Friday, June 11, 12 and 13, as follows:

CONVENING AT 9 A. M. THE SECTIONS ON	CONVENING AT 2 P. M. THE SECTIONS ON
Internal Medicine.	Pediatrics.
Obstetrics and Gynecology.	Surgery, General and Abdominal.
Laryngology, Otology and Rhinology.	Ophthalmology.
Pathology and Physiology.	Experimental Medicine and Therapeutics.
Orthopedic Surgery.	Nervous and Mental Diseases.
Urology.	Dermatology and Syphilology.
Preventive and Industrial Medicine and Public Health.	Gastro-Enterology and Proctology.
Anesthesiology.	Radiology.
General Practice of Medicine.	Miscellaneous Topics: Session on History of Medicine. Session on Physical Medicine. Session on Allergy.

The Registration Bureau, which will be located on the Arena Floor, Atlantic City Convention Hall, will be open from 8:30 a. m. until 5:30 p. m. Monday, Tuesday, Wednesday and Thursday, June 9, 10, 11 and 12, and from 8:30 a. m. to 12 noon Friday, June 13.

HARRISON H. SHOULDERS, President.
ROY W. FOUTS, Speaker, House of Delegates.
GEORGE F. LULL, Secretary.

MEMBERS OF THE HOUSE OF DELEGATES

A Preliminary Roster of the Legislative Body of The American Medical Association

The list of members of the House of Delegates for the session is incomplete, as a number of the state associations are yet to hold their meetings at which delegates will be elected. The following is a list of the holdover members of the House of Delegates and of the newly elected members who have been reported to the Secretary in time to be included:

STATE DELEGATES

ALABAMA

Lloyd Noland, Fairfield.
A. A. Walker, Birmingham.

ARKANSAS

L. J. Kosminsky, Texarkana.
D. A. Rhinehart, Little Rock.

CALIFORNIA

Robertson Ward, San Francisco.
Samuel J. McClendon, San Diego.
Lowell S. Goin, Los Angeles.
John W. Green, Vallejo.

COLORADO

W. T. H. Baker, Pueblo.
William H. Halley, Denver.

CONNECTICUT

Joseph H. Howard, Bridgeport.
Creighton Barker, New Haven.
Thomas P. Murdock, Meriden.

DELAWARE

James Beebe, Lewes.

DISTRICT OF COLUMBIA

C. B. Conklin, Washington.
Herbert P. Ramsey, Washington.

FLORIDA

Edward Jelks, Jacksonville.
H. L. Pearson Jr., Miami.

IDAHO

Edward N. Roberts, Pocatello.

ILLINOIS

Rollo K. Packard, Chicago.
G. Henry Mundt, Chicago.
Charles H. Phifer, Chicago.
Edwin S. Hamilton, Kankakee.
Willis I. Lewis, Herrin.

INDIANA

Don F. Cameron, Fort Wayne.
F. S. Crockett, La Fayette.
H. G. Hamer, Indianapolis.
Alfred S. Giordano, South Bend.

IOWA

Thomas F. Thornton, Waterloo.
George Braunlich, Davenport.
G. V. Caughlan, Council Bluffs.

KANSAS

Forrest L. Loveland, Topeka.
Philip W. Morgan, Emporia.

KENTUCKY

J. B. Lukins, Louisville.
Clark Bailey, Harlan.

LOUISIANA

James Q. Graves, Monroe.
V. H. Fuchs, New Orleans.

MAINE

Thomas A. Foster, Portland.

MARYLAND

Alfred T. Gundry, Baltimore.
Thomas S. Cullen, Baltimore.

MASSACHUSETTS

Charles E. Mongan, Somerville.
Dwight O'Hara, Boston.
Walter G. Phippen, Salem.
David D. Scannell, Boston.
Charles J. Kickham, Brookline.
Leland S. McKittrick, Boston.

MICHIGAN

Leo G. Christian, Lansing.
Frank E. Reeder, Flint.
W. D. Barrett, Detroit.
T. K. Gruber, Eloise.
Claude R. Keyport, Grayling.

MINNESOTA

Francis J. Savage, St. Paul.
E. W. Hansen, Minneapolis.
W. A. Coventry, Duluth.
A. W. Adson, Rochester.

MISSISSIPPI

J. P. Wall, Jackson.

MISSOURI

Arthur R. McComas, Sturgeon.
Warren L. Allee, Eldon.
Robert E. Schlueter, St. Louis.
James R. McVay, Kansas City.

MONTANA

R. F. Peterson, Butte.

NEVADA

M. J. Thorpe, Reno.

NEW HAMPSHIRE

Deering G. Smith, Nashua.

NEW JERSEY

Lucius F. Donohoe, Bayonne.
William F. Costello, Dover.
J. Wallace Hurff, Newark.

ATLANTIC CITY — 1947

For the twelfth time in the last hundred years the American Medical Association is having its annual meeting in Atlantic City. The extraordinary advantages of Atlantic City made it the logical choice for the Centennial Session. These include the finest combination of facilities from the professional, business and entertainment points of view anywhere available.

The convention city is situated on an island closely adjacent to the New Jersey coast. Among the natural advantages are bathing, deep sea fishing, sailing and motor boating. Deep sea fishing has made Atlantic City a mecca for sportsmen. Speed boats and other craft wait on the waters of the Inlet to take passengers for a cruise on the ocean or along the calm waters that separate Atlantic City from the mainland Seaplanes are available to carry passengers for short scenic trips or on hurried flights to distant cities

The Great Piers

The amusement piers in Atlantic City are among the most famous in the world. They provide a great variety of amusements, vaudeville, motion pictures, minstrels, dancing, water sports and other attractions.

The Famous Boardwalk

Along the wide and spacious Boardwalk, built well above the sandy beach, millions of visitors parade each year to enjoy the dawn, the sunlight and the dusk of happy days or to find their favorite entertainment, hotel, supper club or café

The Hotels

Some of the finest hotels in the world are located along the boardwalk. These skyscrapers are ready to cater to every wish of the guest, while an array of smart shops display interesting gifts and merchandise from all corners of the globe

The Convention Hall

The building in which the American Medical Association will hold its meetings covers an area of seven acres fronted on the Boardwalk between Georgia and Mississippi avenues. The building has seating accommodations for nearly 75,000 persons, the main auditorium alone seating 41,000. The Convention Hall is so large that the famous Madison Square Garden in New York could be placed in one corner of the main hall. A thirteen story building 500 feet long and 200 feet wide could be erected within the main auditorium, leaving a space 100 feet on all four sides. The lighting of Convention Hall is a triumph of color and illumination. A pipe organ with 1,255 stops, one of the largest in the world, is in the main hall. The wiring used in this organ would twice girdle the earth.

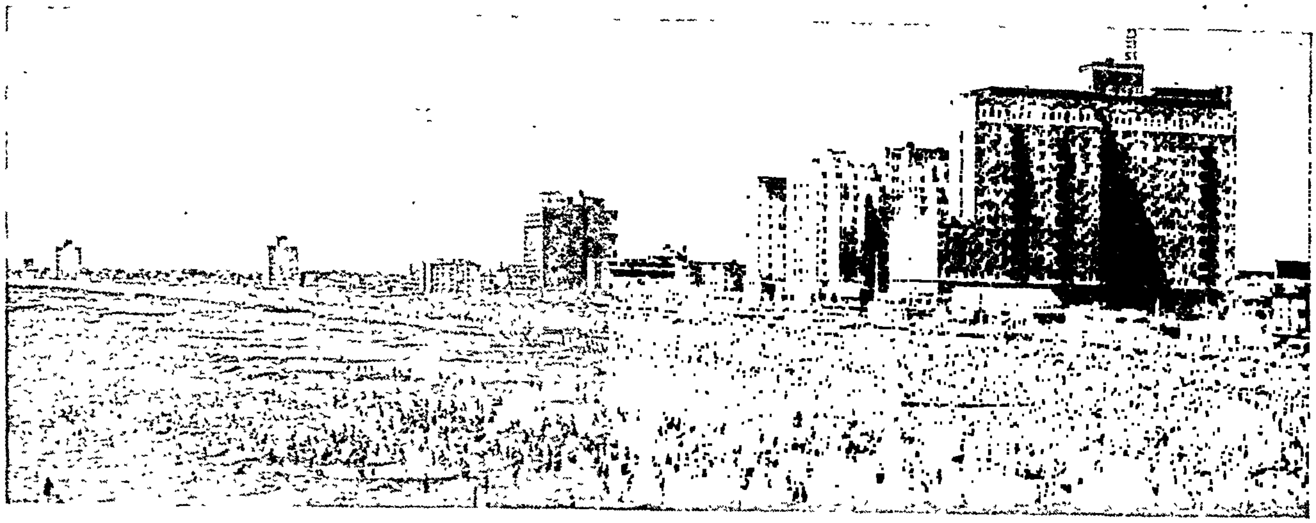
Ventilation and Heating

The Convention Hall is ventilated by means of thirty-one motor driven fans with the capacity of 1,600 tons of air per hour; there is a much larger number of air vents capable of discharging 2,900 tons of air per hour. The temperature throughout the building is maintained by direct radiation and is automatically controlled At the end of the auditorium is a well equipped stage capable of seating 5,000 persons. The lobby leading to Convention Hall has a vaulted passage 125 feet long and 50 feet wide, and from the lobby spacious corridors lead to the upper and lower levels of the auditorium. Along the boardwalk in front of Convention Hall and on the Pacific Avenue side are beautiful stores. From the arcade one may go direct to the interior of the Convention Hall.

Transportation

Atlantic City has adequate and perhaps unequaled transportation facilities which make it possible for millions of persons to

HOTEL TRAYMORE, WHERE THE HOUSE OF DELEGATES WILL MEET.



PANORAMA OF THE BOARDWALK IN ATLANTIC CITY, SHOWING BOARDWALK HOTELS. THE CONVE

go in and out of the city by motor, train, bus and airplane. It is but a short drive to Philadelphia over two famous "Pikes." Five highway bridges cross the Delaware River from Philadelphia toward Atlantic City, and five important ferry routes span the river from Philadelphia south. The Atlantic City airport, said to have been the first municipal airport in the world, is only a few hours from even our Far Western cities.

Rolling Chairs

For those wearing convention badges who desire to tour the Boardwalk in a rolling chair, special rates will be granted. There will be a nominal charge for one, two or three passengers, between certain hotels and the Convention Hall.

Golf

Five splendid golf courses are only a few minutes ride from the center of Atlantic City, and on one of these, the Atlantic City Golf Club, the American Medical Golf Association will hold its thirty-first annual tournament, June 9. Following this eighteen hole competition about one hundred prizes will be awarded. There are also municipally owned tennis courts at the Inlet and the airport, and horseback riding throughout the year. The wide eight mile stretch of beach is an inviting and beautiful bridal path.

Garages

A great convenience to those who drive to the annual session of the American Medical Association is a garage in Convention Hall directly under the arena and the assembly hall. About 500 cars can be accommodated. A special rate will be made for the period of this convention.

Noiseless and Smokeless

One of the unusual qualities that makes Atlantic City attractive to numerous visitors each year is the atmosphere of calm and of seaside serenity that prevails on the Boardwalk and in the hotels, theaters and restaurants. This most desirable quality is achieved largely through the absence of automobiles on the Boardwalk and the absence of smoke and soot because there are no large industries.

REGISTRATION

The Bureau of Registration will be located on the arena floor of the Atlantic City Convention Hall. A branch postoffice in charge of government postoffice officials will be available for visitors, and an information bureau will be operated in connection with the Bureau of Registration.

Who May Register

Only Fellows, Affiliate, Associate and Honorary Fellows and Invited Guests may register and take part in the work of the sections. Fellows of the Scientific Assembly are those who have, on the prescribed form, applied for Fellowship, subscribed to The Journal and paid their Fellowship dues for the current year. Fellowship dues and subscription to The Journal are included in the one annual payment of $8, which is the regular subscription price of The Journal. Fellowship cards are sent to all Fellows after payment of annual dues, and these cards should be presented at the registration window. Any who have not received cards for 1947 should secure them at once by writing to the American Medical Association, 535 North Dearborn Street, Chicago 10.

Advance Registration

Those Fellows who have filled in advance registration cards and sent them to the office of the American Medical Association should present the registration identification card received from the office of the Association to the attendant at any window of the Registration Bureau. The attendant will then hand the registrant a Fellow's badge, an official program and a button for each of his guests.

Members in Good Standing Eligible to Apply for Fellowship in the Association

Members in good standing in the American Medical Association are those members of component county medical societies and of constituent state and territorial medical associations whose names are officially reported for enrolment to the Secretary of the American Medical Association by the secretaries of the constituent medical associations. All members in good standing may apply for Fellowship in the Scientific Assembly and are urged to qualify as Fellows before leaving home in order that pocket cards may be secured and brought to Atlantic City so that registration can be more easily and more promptly effected.

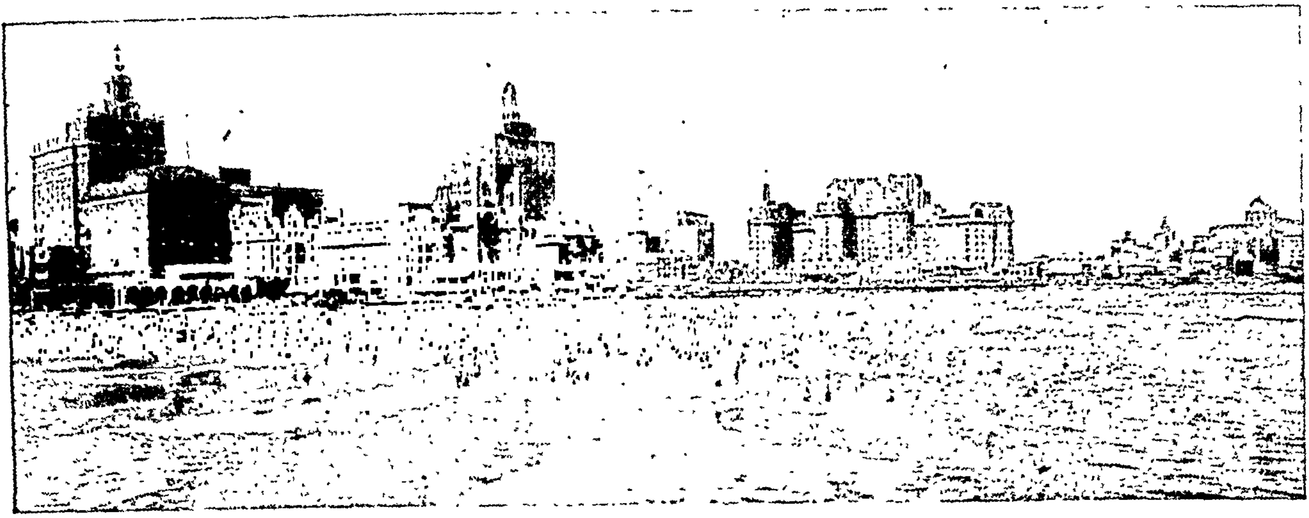
Application forms may be had on request.

Those subscribers to The Journal who have not received pocket cards for 1947 should write to the American Medical Association in order to obtain application blanks and information as to further requirements.

Register Early

Fellows living in Atlantic City, as well as all other Fellows who are in Atlantic City on Monday and Tuesday, should register as early as possible.

The names and local addresses of those who register will be included in the issue of the *Daily Bulletin* appearing the next day, and this will enable visiting physicians to find friends who have registered.



NTION AUDITORIUM IS LOCATED AT A CONVENIENT DISTANCE FROM MOST OF THE LARGE HOTELS.

Suggestions That Will Facilitate Registration

Fellows should fill out completely the spaces on both sections of the front of the registration card. Physicians who desire to qualify as Fellows should fill out completely the spaces on both sections of the front of the registration card and sign the application on the back. These cards will be found on the tables.

Entries on the registration card should be written plainly, or printed, as the cards are given to the printer to use as "copy" for the *Daily Bulletin*, which appears on Tuesday, Wednesday, Thursday and Friday mornings during the week of the session.

Fellows who have their pocket cards with them can be registered with little or no delay. They should present the filled out registration card, together with the pocket card, at one of the windows marked "Registration by Pocket Card." There the clerk will compare the two cards, stamp the pocket card and return it and supply the Fellow with a badge, a copy of the official program and other printed matter of interest to those attending the annual session.

As previously stated, it will assist in registering if those who desire to qualify as Fellows will file their applications and qualify as Fellows by writing directly to the American Medical Association, 535 North Dearborn Street, Chicago 10, so that their Fellowship may be entered not later than May 10. Any applications that are received later than May 10 will be given prompt attention, but the Fellowship pocket card may not reach the applicant in time for him to register at the Atlantic City session.

It will be possible for members of the organization to qualify as Fellows at Atlantic City. In order to do this, applicants for Fellowship will be required to fill out both sections of the front of the registration card and to sign the formal application that is printed on the reverse side of the card. It is suggested that those members who apply for Fellowship at Atlantic City bring with them their state membership cards for the year 1947. The state membership card should be presented along with the filled in registration card at the window in the booth marked "Applicants for Fellowship and Invited Guests."

As already stated, registration can be effected more easily and more promptly if members will qualify as Fellows before leaving home.

Registration for General Officers and Delegates at the Hotel Traymore

General Officers of the American Medical Association and members of the House of Delegates may register for the Scientific Assembly outside the Rose Room of the Hotel Traymore. This arrangement is made for the convenience of members of the House of Delegates, which will convene on Monday morning at 10 o'clock in the Rose Room of the Hotel Traymore. Delegates are requested to register for the Scientific Assembly before presenting credentials to the Reference Committee on Credentials of the House of Delegates. Registration of delegates for the Scientific Assembly will begin at 8 o'clock Monday morning, June 9, and delegates are urged to register early so that all members of the House of Delegates may be seated in time for the opening session of the House.

TRANSPORTATION

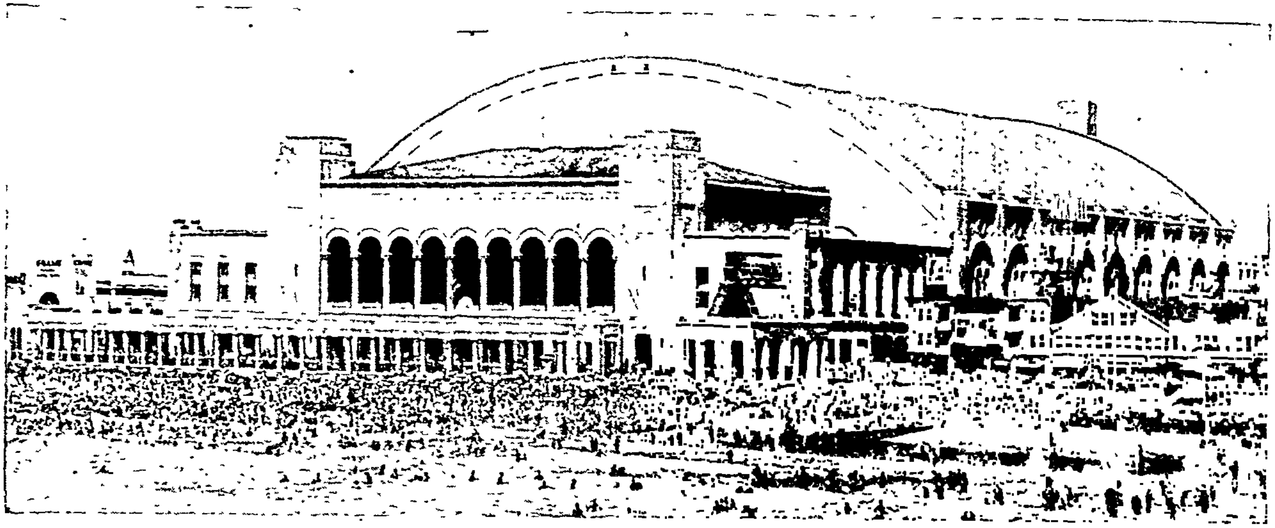
It is suggested that those Fellows who contemplate traveling to Atlantic City to attend the annual session of the Association secure information concerning railroad and airplane travel directly from their local ticket agents, who are in a position to give them information regarding train or plane schedules and fares. Transportation agencies—railroads and airlines—have been notified to contact all Fellows who have registered in advance.

Northwest Airlines, Inc.

Northwest Airlines will give all possible help and assistance to members of the medical profession in planning itineraries and requesting reservations for transportation to the centennial celebration. Doctors desirous of being on the same flight with friends boarding at intermediate points along Northwest's coast to coast route should so advise the reservations office at the time the initial reservation is made.

ATLANTIC CITY HOTELS

A limited number of rooms are still available at certain hotels in Atlantic City. It is suggested that if hotel reservations have not yet been secured by Fellows who expect to attend the Atlantic City session, such Fellows write directly to DR. ROBERT A. BRADLEY, SUBCOMMITTEE ON HOTELS, 16 CENTRAL PIER, ATLANTIC CITY, N. J.



THE CONVENTION HALL, WHERE THE ANNUAL SESSION WILL BE HELD.

MEETING PLACES

House of Delegates: Rose Room, Hotel Traymore, Boardwalk at Illinois Avenue.

General Scientific Meetings: Ballroom, Second Floor, Convention Hall.

General Meeting: Ballroom, Second Floor, Convention Hall.

General Headquarters, Registration Bureau, Scientific Exhibit, Technical Exhibits, Information Bureau and Branch Postoffice: Convention Hall.

SECTIONS OF SCIENTIFIC ASSEMBLY

Internal Medicine: Ballroom, Second Floor, Convention Hall.

Surgery, General and Abdominal: Westminster Hall, Chelsea Hotel.

Obstetrics and Gynecology: Westminster Hall, Chelsea Hotel.

Ophthalmology: Embassy Salon, Ambassador Hotel.

Laryngology, Otology and Rhinology: Embassy Salon, Ambassador Hotel.

Pediatrics: Ballroom, Second Floor, Convention Hall.

Experimental Medicine and Therapeutics: Wedgewood Room, Chelsea Hotel.

Pathology and Physiology: Wedgewood Room, Chelsea Hotel.

Nervous and Mental Diseases: St. Dennis Room, Dennis Hotel.

Dermatology and Syphilology: Wedgewood Room, Marlborough-Blenheim Hotel.

Preventive and Industrial Medicine and Public Health: Trellis Room, Ritz-Carlton Hotel.

Urology: Wedgewood Room, Marlborough-Blenheim Hotel.

Orthopedic Surgery: St. Dennis Room, Dennis Hotel.

Gastro-Enterology and Proctology: Trellis Room, Ritz-Carlton Hotel.

Radiology: Room 20, Convention Hall.

Anesthesiology: Room 20, Convention Hall.

General Practice of Medicine: Cambridge Hall, Claridge Hotel.

Miscellaneous Topics: Session on History of Medicine, Session on Physical Medicine and Session on Allergy: Cambridge Hall, Claridge Hotel.

ENTERTAINMENT

Conference of County Society Officers

There will be a conference of county medical society officers on Sunday, June 8, at 2:30 p. m., in the American Room of the Hotel Traymore. It will be conducted in round table fashion with Dr. A. M. Mitchell of Terre Haute, Ind., as moderator. Fellows are invited to attend this conference.

Dinner for Delegates

A dinner is being arranged by the Board of Trustees of the American Medical Association for Monday, June 9, for members of the House of Delegates and officers of the Association in the American Room of the Hotel Traymore. Complete information concerning the dinner will be available at the first meeting of the House of Delegates on Monday morning, June 9.

Luncheon for Delegates

A luncheon for the members of the House of Delegates and the officers of the American Medical Association is being planned for Tuesday noon, June 10, between the morning and afternoon meetings of the House of Delegates at the Hotel Traymore.

Installation of President

The General Meeting at which the President will be installed will be held on Tuesday evening, June 10, in the Ballroom of Convention Hall. The program will begin at 8 o'clock with a musical presentation by the Philadelphia Festival Orchestra followed by the regular program as published elsewhere in this section.

Breakfast for Vice Presidents

STAMP COMMEMORATING A. M. A. CENTENNIAL

Postmaster General Robert E. Hannegan has approved the issuance of a commemorative postage stamp honoring the doctors of America, the Post Office Department announced on April 8. The special stamp will be of the three cent variety and will be placed on sale June 9 on the occasion of the hundredth anniversary of the founding of the American Medical Association. "In so honoring the American doctor," Mr. Hannegan said, "we are paying tribute to the men and women of medicine who devote their lives to the cause of humanity. Alleviation of pain and suffering and the betterment of mankind are their creed. The contribution which they have made to our national life is one of which all America can be proud and grateful." Details as to the place of sale and description of the stamp will be announced later.

WOMAN'S AUXILIARY

The Woman's Auxiliary to the American Medical Association will hold its twenty-fourth annual meeting in Atlantic City, June 9 to 12.

A cordial invitation is extended to the wives and guests of members of the American Medical Association attending the convention to be present at the general sessions and take part in the social functions of the Woman's Auxiliary. Headquarters will be at Haddon Hall, where all meetings and social events will be held unless otherwise specified in the program.

Please register early and secure your badge. Tickets will be available at the headquarters at Haddon Hall only and should be purchased as soon after arrival as possible.

Friday, June 13

Exhibits at Convention Hall.

PHYSICIANS' ART EXHIBIT

The American Physicians' Art Association and Literary Guild will hold an extensive and interesting exhibit in the Atlantic City Convention Hall during the session. The three distinct departments in this show are (1) the regular yearly art exhibit, in which over one hundred cups will be awarded, (2) the $34,000 bond contest offered by Mead Johnson & Company for pictures and sculpture done by physicians depicting Courage and Devotion Beyond the Line of Duty, (3) nonmedical writings by physicians, prose and poetry, for which the winners in twelve different fields of writing will be awarded beautiful plaques.

This year doctor members are sending in pieces not only from the whole of the United States, Canada, Hawaii and the Philippines but also from leading cities of Central and South America.

Judges for the two art exhibits are being selected from leading professional artists of Philadelphia and New York. There will be nearly two thousand pieces submitted.

For further information consult F. H. Redewill, M.D., Secretary of the American Physicians' Art Association and American Physicians' Literary Guild, 526 Flood Building, San Francisco 2.

GOLF TOURNAMENT

The American Medical Golfing Association will hold its thirty-first tournament on Monday, June 9. For those playing thirty-six holes, Linwood Country Club has been reserved; the A. M. G. A. Fellows who play only one round will be accommodated at the Atlantic City Country Club, where the dinner will be held and prizes awarded.

Trophies and Prizes

Trophies will be awarded for the Association Championship, the Will Walter Trophy; the Association Handicap Championship, the Detroit Trophy; Championship Flight, First Gross, the St. Louis Trophy; Championship Flight, First Net, the President's Trophy, donated by James W. Morgan, San Francisco; Eighteen Hole Championship, the Golden State Trophy; Eighteen Hole Handicap Championship, the Ben Thomas Trophy and the Atlantic City Trophy; Maturity Event, the Minneapolis Trophy; and the Old Guard Championship, the Wendell Phillips Trophy.

In addition to these, approximately seventy-five other prizes will be in competition.

Two Courses in Excellent Condition

Both the Atlantic City Country Club and the Linwood Country Club courses are ideal for experts and a treat for players with higher handicaps. Fellows may tee off between 7:30 a. m. and 2:30 p. m. Luncheon will be served at both clubs The golfers' banquet will be held in the Atlantic City Country Club house at 7 p. m. The awarding of the many trophies and prizes will follow. Entertainment will be spontaneous—by Fellows.

Atlantic City Committee on Arrangements

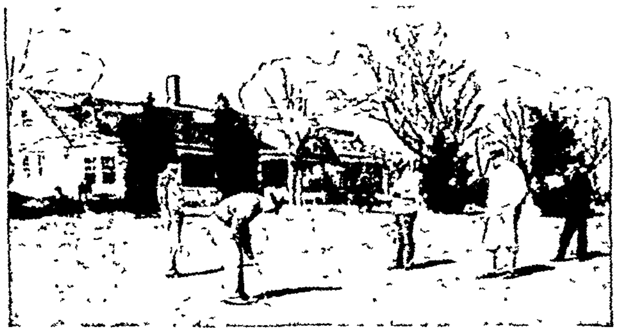
The Atlantic City Committee on Arrangements is under the chairmanship of Jean A. Gruhler, 101 South Indiana Avenue, Atlantic City. He will be assisted by L. Elmore Hess, James H. Mason, B. H. Timberlake and C. B. Whims.

Application for Membership

The A. M. A. Centennial Tournament will be a highly celebratory event. Old and new Fellows will have the opportunity to enjoy a wonderful day of golf, to win a nice prize and to join in the famous goodfellowship of the American Medical Golfing Association.

All male Fellows of the American Medical Association are cordially invited to become Fellows of the American Medical Golfing Association. Write Secretary Bill Burns, 2020 Olds Tower, Lansing 8, Mich., for application blank.

Participants in the tournament are required to present their home club handicap, signed by the club secretary, or to accept a handicap set by the A. M. G. A. Handicap Committee. No handicap over 30 is allowed. A Fellow absent from the annual banquet following the tournament forfeits his rights to a trophy or prize.



ATLANTIC CITY GOLF CLUB, WHERE THE ANNUAL TOURNAMENT WILL BE HELD.

American Medical Golfing Association Officers

James W. Morgan, San Francisco, is President, J. A. Bargen, Rochester, Minn., and Frank Sheehy, San Francisco, are vice presidents of the A. M. G. A. President Morgan anticipates that over 250 Fellows of the A. M. G. A. will play in the enjoyable A. M. G. A. Tournament in Atlantic City on Monday, June 9.

MEETINGS OF OTHER ORGANIZATIONS

Aero Medical Association

The eighteenth annual meeting of the Aero Medical Association will be held in Atlantic City at the Ritz-Carlton Hotel from June 4 to June 6. There will be registration and scientific sessions on the three days, the annual business session being held on Friday, June 6. The winners of the Theodore C. Lyster Award and Raymond F. Longacre Award will be announced at the annual banquet on Thursday, June 5.

American College of Chest Physicians

The American College of Chest Physicians will hold its thirteenth annual meeting at the Ambassador Hotel, June 5 to 8. Scientific sessions will be held on each day, a program on Information Please in Diseases of the Chest being planned for 8 p. m. on Friday, June 6. Oral examinations for fellowship will be conducted at 9 a. m. and written examinations at 2 p. m. on Thursday, June 5. The dinner, International Night, will be at 6:30 Thursday, June 5.

American College of Radiology

The regular annual meeting of the American College of Radiology will be held at Haddon Hall, June 8, starting at 3 p. m., at which time there will be received the reports of the officers, of standing commissions and of standing committees followed by new business, the report of the nominating committee and the election of officers.

American Society of Electroencephalography

The first annual meeting of the American Society of Electroencephalography will be held at the Marlborough-Blenheim Hotel June 13 to 15. All interested are invited to attend.

National Gastroenterological Association

The twelfth annual convention and scientific sessions of the National Gastroenterological Association will be held June 4 to 6. The program will consist of eighteen separate papers on various phases of gastroenterology and allied subjects. The program and other details may be obtained from the National Gastroenterological Association, 1819 Broadway, New York 23. At the luncheon round table conference on Thursday, June 5, Dr. Hyman I. Goldstein of Camden, N. J., will speak on the history of gastroenterology and the development of this specialty in America.

American Society for the Study of Sterility

The third annual convention of the American Society for the Study of Sterility will convene at the Hotel Strand on June 7 and 8, and the general theme of the meetings will be that of attempting to disseminate to the physician treating marital infertility an overall picture of the latest advances in reproduction. The program will consist of original papers, round table discussions, scientific exhibits and personal demonstration. Registration is open to members of the medical and allied professions. For additional information, write Dr. John O. Haman, 490 Post Street, San Francisco 2.

American Neisserian Medical Society

The ninth annual session of the American Neisserian Medical Society will convene June 8 at the Marlborough-Blenheim Hotel. The scope of the society has been increased to include the medical and public health aspects of all the venereal diseases. All physicians interested are cordially invited to attend.

Dates of Meetings of Other Organizations in Atlantic City Prior to Annual Session of American Medical Association

American College of Allergists, Hotel Senator, June 6-8.
American Geriatrics Society, Hotel Brighton, June 5-7.
American Heart Association, Hotel President, June 6-7.
American Medical Women's Association, June 7-8.
American Proctologic Society, June 7.
American Radium Society, June 8.
American Society for the Study of the Blood, Claridge Hotel, June 8 (organization meeting).
American Society of Clinical Pathologists, June 4-8.
American Therapeutic Society, Chalfonte Hotel, June 6-7.
Association for the Study of Internal Secretions, June 6-7.

DISTINGUISHED FOREIGN GUESTS

The following distinguished foreign guests will be present and participate in the work of the Scientific Assembly at the Centennial Celebration:

Sir William Heneage Ogilvie, surgeon to Guy's Hospital and Royal Masonic Hospital, London, England; examiner in surgery to Cambridge and Oxford universities and the examining board of the Royal Colleges; vice president of the Royal College of Surgeons of England, 1945-1947; editor of the *Practitioner;* author of the Treatment of Fractures in General Practice and various other works. Dr. Ogilvie in the second world war was consulting surgeon to the East African Campaign, the Middle East Force and the Eastern Command.

Sir William H. Ogilvie

Dr. R. M. B. MacKenna, physician in charge of the dermatologic department of St. Bartholomew's Hospital, London; physician at St. John's Hospital for Diseases of the Skin; editor of the recent book "Modern Trends in Dermatology"; author of Aids to Dermatology and of the third and fourth editions of R. W. MacKenna's manual "Diseases of the Skin"; on the editorial board of the *Quarterly Review of Dermatology and Syphilology;* fellow of the Royal Society of Medicine; adviser in dermatology to the War Office; honorary dermatologist, Royal Liverpool United Hospital; honorary assistant dermatologist, Liverpool Radium Institute; command specialist in dermatology, Northern Command, 1940-1941. During the recent war was consultant in dermatology to the British army.

Dr. R. M. B. MacKenna

Dr. Corneille Heymans, professor of pharmacology, University of Ghent, Belgium; Nobel Prize Winner in Medicine in 1938 for his studies on physiology and pharmacology of respiration and circulation; member of the Council of Foods National de la Recherche Scientifique de Belgique; formerly lectured at New York University, Harvard Medical School, Western Reserve University School of Medicine and at the Greensfelder Memorial Foundation, Chicago. Author of Le sinus carotidien and many other works.

Dr. John McMichael, professor of medicine, University of London, and director, department of medicine, British Postgraduate Medical School; published numerous papers on splenic anemia and related subjects; formerly lecturer in physiology, University of Edinburgh; conducted clinical research on cardiac output in health and disease; as Johnston Lawrence Research fellow of the Royal Society has conducted research on hemorrhage and shock; cooperated with the Harvard Red Cross Unit at Salisbury in investigating hepatitis following the inoculation of convalescent mumps serum.

Dr. Corneille Heymans

Dr. George Ewart Martin, surgeon of the ear, nose and throat department, Royal Infirmary, Edinburgh, Scotland; lecturer in diseases of the larynx, ear and nose, Edinburgh University; member of the President's Council of the Royal College of Surgeons, Edinburgh, and of the Council of the British Otolaryngological Association; immediate past president of the laryngologic section, Royal Society of Medicine, London; during the war was adviser in otolaryngology to the Scotland Department of Health; joint author of Turner's Diseases of the Nose, Throat and Ear.

Dr. Robert Debré, professor of the Children's Clinic at the Faculty of Paris, France, and chief physician, Hospital for Diseases of Children; member of the Medical Academy and of the Royal Society of Medicine in London; corresponding Member of the British Pediatric Association; president of the French Association of Pediatry; consultant to the State Department of Health; member of the assembly of the Pasteur Institute; a co-worker of Calmette, Roux, Maurice Nicolle and Leon Bernard and a pupil of Marfan; served in both world wars and now is Commander of the Legion of Honor.

Dr. John McMichael

Dr. Göran Liljestrand, since 1918 secretary of the Nobel Committee for Physiology and Medicine and professor of pharmacology, Kolinska Institutet, Stockholm, Sweden, and assistant professor in physiology; studied in London, Belgium, Denmark and Germany; immediate past president of the Swedish Medical Association; member of the Swedish Academy of Science and of various scientific societies in other countries; lectured in Boston.

Dr. George White Pickering, professor of medicine and director of the Medical Clinic, St. Mary's Hospital, London, England; formerly assistant to Sir Thomas Lewis and lecturer in cardiovascular pathology at the University College Hospital; member of the Medical Research Council; conducted research with Lewis on Raynaud's disease and independently on hypertension and vasomotor tone; now working on peptic ulcer and hypertension. Member of the Committee on Wound Shock of the Medical Research Council. Since 1945 editor of "Clinical Science."

Dr. George E. Martin

Sir Howard Walter Florey, professor of pathology, University of Oxford, England; honorary consultant in pathology to the British army in 1943; visiting professor to Australia and New Zealand in 1944; Nobel Prize Winner in Physiology and Medicine in 1945 for his work on penicillin; awarded the Lister Medal, the Cameron Prize of the University of Edinburgh and the Berzelius Medal of the Swedish Medical Society and numerous other honors by scientific societies and various universities.

Dr. Robert Debré

Sir Stewart Duke-Elder, brigadier, R. A. M. C.; surgeon oculist to the King; consulting ophthalmic surgeon to the British army; ophthalmic surgeon, St. George's Hospital, London; lecturer in ophthalmology, St. George's Hospital Medical School, University of London; William Mackenzie Memorial Medalist (Glasgow) 1929; Howe lecturer in ophthalmology, Harvard Medical School, Boston, in 1930; examiner in ophthalmology for the Royal College of Physicians and Surgeons 1932-1935; author of a textbook of ophthalmology.

Dr. Herbert John Seddon, professor of orthopedic surgery, University of Oxford, England; clinical director, Wingfield Morris Orthopedic Hospital, Oxford; instructor in surgery at the hospital of the University of Michigan, Ann Arbor, Mich., in 1930; honorary secretary, British Orthopedic Association; awarded the Robert Jones medal and Association prize, 1933; Hunterian professor, Royal College of Surgeons, 1935; member, Central Council for the Care of Cripples.

Dr. Göran Liljestrand

Dr. Gonzalo Esguerra Gomez, for many years manager of the Marly Clinic, Bogota, Colombia, and on the Faculty of Medicine of the University of Colombia; formerly director, radiologic laboratory, San Juan de Dios Hospital, Bogota; professor of radiology, National School of Dentistry; formerly president of the Sociedad de Medicina Tropica and delegate to the fifth International Radiology Congress in Chicago, 1937; member of the Academia Nacional de Medicina; author of numerous works in the field of radiology.

Dr. Thierry Alajouanine, Paris, France, now professor of the history of medicine at the University of Paris; will succeed to the chair of neurology at the university on July 1, when Professor Guillain retires; interned in the service of Dr. Souques at the university; became assistant professor under Professor Guillain; attending neurologist to the Bicêtre, a large hospital for chronically ill men. Author of many books and fundamental articles on various phases of clinical neurology; will address the Section on Nervous and Mental Diseases.

Dr. George W. Pickering

Dr. E. Asworth Underwood, London, England, director, Wellcome Historical Medical Museum; formerly resident surgeon and resident physician, Western Infirmary, Glasgow; author of "Manual of Tuberculosis," second edition, 1937, and numerous articles.

Dr. Jose Valls, Buenos Aires, Argentina, professor of orthopedic surgery, University of Buenos Aires, and president of the Argentine Medical Association, will address the Section on Orthopedic Surgery on "The Aspiration Biopsy in the Diagnosis of the Lesions of the Vertebral Bodies."

Sir Howard W. Florey

Dr. Francisco deP. Miranda, director of the National Institute of Nutrition, Mexico City, Mexico; head of the Hospital del Niño; a guest of the American Medical Association on previous occasions; will address the Section on General Practice of Medicine.

Dr. Andrew Rennie Hunter of the Manchester Royal Infirmary, Manchester, England; senior resident and anesthetist, Royal Infirmary, Falkirk; formerly senior house officer, Gleneagles Hospital, Department of Health, Scotland; will address the Section on Anesthesiology.

Dr. Ernst James Heyman, professor of obstetrics and gynecology at the Caroline Institute in Stockholm, Sweden; present physician for the division of gynecology at the Radium Institute in Stockholm; head physician at the Radium Institute since 1937. Editor of the annual report issued by the League of Nations on the results of radiotherapy in uterine cancer.

Sir Stewart Duke-Elder

Dr. Donald Y. Solandt, Toronto, Canada; professor of physiologic hygiene, University of Toronto, and professor of physiology in charge of the section of biophysics; formerly associate professor of physiology; for many years conducted research in physiology and biophysical research also at the University of Pennsylvania and at the University of London; member of various committees of the National Research Council of Canada; served on active duty, also at sea, as surgeon commander, Royal Canadian Navy Reserve, during World War II.

Dr. Donald Y. Solandt

Dr. Hector Ducci, Santiago, Chile, assistant professor of medicine, University of Chile Medical School; in charge of the section of hepatology of Dr. Herman Messandi's medical service at Hospital Salvador, Santiago; general secretary of the Medical Society of Santiago; formerly assistant in bacteriology and assistant in medicine; formerly Rockefeller fellow at the University of Minnesota Hospitals, Department of Internal Medicine; will address the Section on Internal Medicine.

Dr. Frank S. Patch, Montreal, Canada; formerly president of the Canadian Medical Association and of the Royal College of Physicians and Surgeons of Canada; on the consulting staff of Montreal General Hospital; for many years professor of urology and chairman of the departments of surgery and urology, Magill University, Montreal; formerly managing editor, *Canadian Medical Association Journal;* president of the Montreal Medico-Chirurgical Society; colonel, Canadian Army Medical Corps, in World War I; author of numerous articles in the field of urology.

Dr. Hector Ducci

Dr. Sven Forssman, professor and head of the department of industrial hygiene, National Institute of Public Health, Stockholm, Sweden; editor of the *Scandinavian Journal of Hygiene;* secretary of the Swedish Medical Society; vice chairman, Swedish Association of Industrial Physicians.

REPRESENTATIVES OF FOREIGN MEDICAL ASSOCIATIONS

The following representatives of foreign governments or medical associations will attend the Centennial Celebration:

Dr. George Constam of the Federation des Médecins Suisses, Zurich, Switzerland, will be the official representative of that organization to the Centennial Session.

Dr. Szeming Sze

Dr. Harry Guy Dain, London, England, chairman of the council of the British Medical Association; member of the Royal College of Surgeons; formerly resident surgeon officer and resident medical officer of Children's Hospital, Birmingham; assistant surgeon, General Hospital, Birmingham

Dr. John A. Pridham, London, England, chairman, International Relations Committee of the British Medical Association; member of the Royal College of Surgeons; honorary secretary, Dorset Local Medical and Panel Committee; author of "Problem of the Care of the Neurotic Patient."

Dr. Szeming Sze, formerly secretary-general of the Chinese Medical Association, and editor of the *Chinese Medical Journal;* assistant superintendent, Chungshan Hospital, Shanghai; senior technical expert, National Health Administration; adviser, Commission on Medical Education of China; vice president, Interim Commission of World Health Organization; director, National Anti-Tuberculosis Association and of the Health League of China; at present medical director, Chinese Supply Commission, Washington, D. C.

Dr. T. C. Routley

Dr. Thomas Clarence Routley, General Secretary, Canadian Medical Association; former secretary of the Ontario Medical Association for many years; Fellow of the *Royal College of Physicians and* Surgeons of Canada; Commander of the Order of the British Empire; member of the Toronto Academy of medicine and of the Alpha Omega Alpha Horonary Medical Fraternity; for four years served as general secretary of the Canadian Medical Procurement and Assignment Board.

Dr. Chafic Trefi, a graduate in medicine of the University of Paris; formerly surgeon in Iraq hospitals and in Syrian public health hospitals; represented the Syrian government in the special meeting of the United Nations in 1946 when the charter of the World Health Organization was drawn up; at present in the United States for training in surgical technic, and serving as assistant in the surgical service, Presbyterian Hospital of Columbia University, New York.

Dr. Chafic Trefi

Dr. Charles Hill, secretary of the British Medical Association; formerly extension lecturer in biology, University of London, England; clinical assistant, Children's Department, London Hospital; author of "What Is Osteopathy?" (jointly) and recent legislation in medical practice.

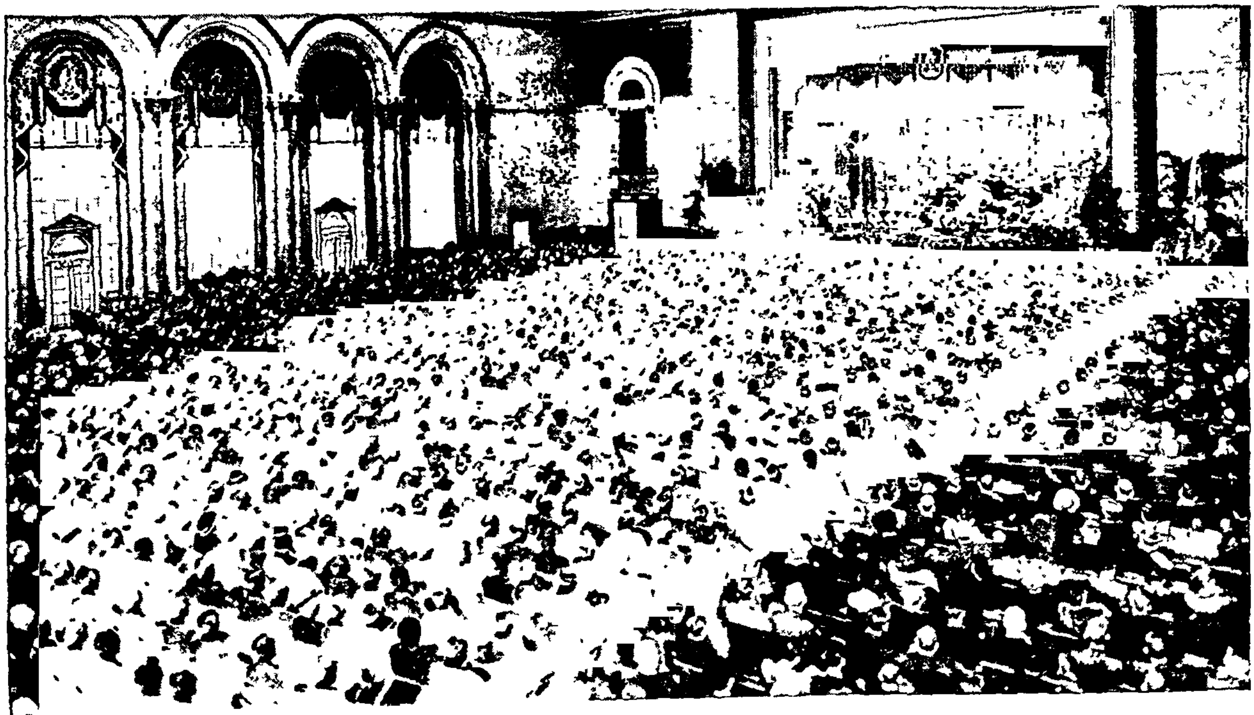
Dr. Hugh Anthony Clegg, editor of the *British Medical Journal,* formerly house physician at St. Bartholomew's Hospital, London, and at Brompton Hospital for diseases of the chest; medical registrar, Charing Cross Hospital; assistant medical officer, London County Council; author of "What Is Osteopathy?" (jointly), Wartime Health and Democracy, Nineteenth Century, Life and Letters and other works.

Dr. Charles Huritz, representing the Medical Association of South Africa.

Dr. A. Torab Mehra, representing the government of Iran.

Dr. Salvador Zubiran, president of the National Academy of Medicine of Mexico, and Drs. Manuel Guevara Oropesa, Donato G. Alarcon, Jose Rabago, Miguel Jimenez y Sanchez and Francisco de P. Miranda, representing the National Academy of Mexico. Dr. Miranda is also an invited guest of the Section on General Practice

Dr. Francisco de P. Miranda



INTERIOR OF THE AUDITORIUM, SCENE OF THE OPENING MEETING AND THE RECEPTION TO THE PRESIDENT.

Herbert John Seddon, Oxford, England.
Question and Answer Period.

12 m.

General Summary. R. Arnold Griswold, Louisville, Ky.
Intermission

2 p. m.

L. W. Larson, Bismarck, N. D., Presiding

Skin Problems of the Elderly. Oliver S. Ormsby, Chicago.
Cancer of the Uterus. Emil Novak, Baltimore.
Radioactive Products in Medicine. Stafford Warren, Los Angeles.
New Antibiotic Agents. Howard Florey, Oxford, England.
Intermission.

3:30 p. m.

Clyde L. Cummer, Cleveland, Presiding

Panel Discussion on Antibiotic Therapy

Wesley W. Spink, Minneapolis, Moderator

Streptomycin. Chester S. Keefer, Boston.
Chemotherapy in Surgery. John S. Lockwood, New York.
Development of Bacterial Resistance to Antibiotics. Charles Phillip Miller, Chicago.
Howard Florey, Oxford, England.
Question and Answer Period.

5 p. m.

General Summary. Wesley W. Spink, Minneapolis.

THE GENERAL MEETING

Ballroom, Convention Hall

Tuesday, June 10—8:00 p. m.

Music by the Philadelphia Festival Orchestra, conducted by Alexander Hilsberg, which will present a program, as follows:

Alexander Hilsberg

Sibelius	Finlandia
Mendelssohn	Midsummer Night's Dream Scherzo Nocturne
Paganini	Moto Perpetuo
McDonald	Legend of the Arkansas Traveler
Intermission	
Glinka	Overture: Russlan and Ludmilla
Ippolitow-Ivanov	In the Village, From Caucasian Sketches
Tschaikovsky	Romeo and Juliet

THE PROGRAMS OF THE SECTIONS

Outline of the Scientific Proceedings—The Preliminary Program and the Official Program

The following papers are announced to be read before the various sections. The order here is not necessarily the order that will be followed in the Official Program, nor is the list complete. The Official Program will be similar to the programs issued in previous years and will contain the final program of each section with abstracts of the papers, as well as lists of committees, program of the General Meeting, list of entertainments and other information. To prevent misunderstandings and protect the interest of advertisers, it is here announced that this Official Program will contain no advertisements. It is copyrighted by the American Medical Association and will not be distributed before the session. A copy will be given to each Fellow on registration.

SECTION ON INTERNAL MEDICINE

MEETS IN BALLROOM, CONVENTION HALL

OFFICERS OF SECTION

Chairman—Joseph T. Wearn, Cleveland.

Vice Chairman—Roy H. Turner, New Orleans.

Secretary—Cecil J. Watson, Minneapolis.

Executive Committee—Burrell O. Raulston, Los Angeles; William D. Stroud, Philadelphia; Joseph T. Wearn, Cleveland.

Wednesday, June 11—9 a. m.

The Clinical Syndrome of Cardiac Pain Intermediate Between Angina Pectoris and Acute Myocardial Infarction, i. e. "Coronary Failure" (Lantern Demonstration).

A. Stone Freedburg, Herrman L. Blumgart, Paul M. Zoll and Monroe J. Schlesinger, Boston.

Discussion to be opened by Arthur M. Master, New York; W. D. Stroud, Philadelphia, and Robert L. Levy, New York.

The Cardiovascular System as the Effector Organ in Psychosomatic Phenomena.

George E. Burch and Clarence Thorpe Ray, New Orleans.

Discussion to be opened by George A. Wolf Jr., New York, and Mandel E. Cohen, Boston.

The Frank Billings Lecture: Frank Billings, Physician, Teacher and Citizen. Ernest E. Irons, Chicago.

Recent Investigations on the Etiology and Treatment of Hypertension (Lantern Demonstration).

Richard H. Lyons, Syracuse, N. Y.

Discussion to be opened by K. G. Kohlstaedt, Indianapolis.

An Appraisal of the Modern and Surgical Methods of Treating Peptic Ulcer (Lantern Demonstration).

Russell S. Boles, Philadelphia.

Discussion to be opened by Walter L. Palmer, Chicago, and Frank H. Lahey. Boston.

Thursday, June 12—9 a.m.

Election of Officers

The Diagnosis and Treatment of Bulbar Poliomyelitis (Lantern Demonstration). A. B. Baker, Minneapolis.

Discussion to be opened by John R. Paul, New Haven, Conn., and Hart E. van Riper, New York.

Streptomycin in the Treatment of Tuberculosis in Human Beings (Lantern Demonstration).

Walsh McDermott, Carl Muschenheim and Susan J. Hadley, New York.

Discussion to be opened by J. Burns Amberson, New York, and John B. Barnwell, Washington, D. C.

Chairman's Address: A Challenge of Functional Disease.

Joseph T. Wearn, Cleveland.

The Use of Urethane in the Treatment of Leukemia (Lantern Demonstration).

John S. Hirschboeck, M. C. F. Lindert, Thomas L. Calvy and Jules Chase, Milwaukee.

Discussion to be opened by Claude E. Forkner, New York, and Leon O. Jacobson, Chicago.

The Mechanism and Management of the Hemorrhagic Tendency of Congestive Splenomegaly (Lantern Demonstration).

Leandro M. Tocantins, Philadelphia.

Discussion to be opened by William Dameshek, Boston, and Cecil O. Patterson, Dallas, Texas.

Concentrated Vitamin D for Rheumatism: Toxic Reactions Simulating Hyperparathyroidism (Lantern Demonstration). C. H. Slocumb, Rochester, Minn.

Discussion to be opened by Richard H. Freyberg, New York, and Smith Freeman, Chicago.

Friday, June 13—9 a. m.

JOINT MEETING WITH SECTION ON EXPERIMENTAL MEDICINE AND THERAPEUTICS

Address of Invited Foreign Guest, Section on Internal Medicine: The Contribution of the Laboratory to the Differential Diagnosis of Jaundice.

Hector Ducci Claro, Santiago, Chile.

Centennial Address of Section on Internal Medicine: History of Internal Medicine in the United States (Lantern Demonstration). Reginald Fitz, Boston.

PANEL DISCUSSION ON RECENT ADVANCES IN TREATMENT

Morris Fishbein, Moderator

Virus Diseases. Thomas M. Rivers, New York.

Gastrointestinal Diseases (Lantern Demonstration).

Henry L. Bockus, Philadelphia.

Cardiovascular Diseases. Arlie R. Barnes, Rochester, Minn.

Cancer. Cornelius P. Rhoads, New York.

Blood Diseases. Russell L. Haden, Cleveland.

Infectious Diseases (Lantern Demonstration).

Chester S. Keefer, Boston.

Pulmonary Disease. James J. Waring, Denver.

Endocrinology (Lantern Demonstration).

Willard O. Thompson, Chicago.

SECTION ON SURGERY, GENERAL AND ABDOMINAL

MEETS IN WESTMINSTER HALL, CHELSEA HOTEL

OFFICERS OF SECTION

Chairman—Alton Ochsner, New Orleans.

Vice Chairman—John B. Flick, Philadelphia.

Secretary—Michael E. DeBakey, New Orleans.

Executive Committee—Frederick A. Coller, Ann Arbor, Mich.; Daniel C. Elkin, Atlanta, Ga.; Alton Ochsner, New Orleans.

Wednesday, June 11—2 p. m.

Address of Invited Foreign Guest: Gastric Surgery After One Hundred Years. Heneage Ogilvie, London, England.

Chairman's Address: Carcinoma of the Lung (Lantern Demonstration). Alton Ochsner, New Orleans.

Transthoracic Resection of the Esophagus and Cardiac End of the Stomach for Carcinoma: An Analysis of the Postoperative Complications, Causes of Death and Late Results of Operation (Lantern Demonstration).

Richard H. Sweet, Boston.

Discussion to be opened by B. Noland Carter, Cincinnati; Dallas B. Phemister, Chicago, and John H. Garlock, New York.

The Problem of Gastric Cancer (Lantern Demonstration).

Owen H. Wangensteen, Minneapolis

Discussion to be opened by George T. Pack, New York, and Waltman Walters, Rochester, Minn.

Radical Resection of the Head and Total Pancreatectomy for Benign and Malignant Lesions of the Pancreas (Lantern Demonstration). John M. Waugh, Rochester, Minn.

Discussion to be opened by Allen O. Whipple, New York, and Richard B. Cattell, Boston.

Surgical Management of Carcinoma of the Colon and Large Bowel (Lantern Demonstration).

Fred W. Rankin and Coleman C. Johnston, Lexington, Ky.

Discussion to be opened by Thomas E. Jones, Cleveland, and Leland S. McKittrick, Boston.

Thursday, June 12—2 p. m.

Election of Officers

Centennial Address: A Century of American Surgery.
Evarts A. Graham, St. Louis.

Protein Nitrogen Retention Following Injury.
Sidney C. Madden, Atlanta, Ga.
Discussion to be opened by William Parson, New Orleans.

The Problem of Amino Acid Utilization in the Surgical Patient (Lantern Demonstration). Paul R. Cannon, Chicago.
Discussion to be opened by Robert Elman, St. Louis.

Management of Protein Deficiency in Surgical Patients: Use of Whole Blood Transfusion (Lantern Demonstration).
Champ Lyons, New Orleans.
Discussion to be opened by Everett I. Evans, Richmond, Va., and Hyman S. Mayerson, New Orleans.

Management of Protein Deficiency in Surgical Patients: Use of Intravenous and Intrajejunal Injections (Lantern Demonstration). John D. Stewart, Buffalo.
Discussion to be opened by Arthur W. Allen, Boston, and I. S. Ravdin, Philadelphia.

Nutritional Problems of Substandard Risk Patients.
Richard L. Varco, Minneapolis.
Discussion to be opened by Donald D. Kozoll, Chicago.

Friday, June 13—2 p. m.

JOINT MEETING WITH SECTION ON GASTRO-ENTEROLOGY AND PROCTOLOGY

SYMPOSIUM ON PEPTIC ULCER

Statistical Study of Over 1,000 Cases of Peptic Ulcer (Lantern Demonstration). Maurice Feldman, Baltimore.

Onset of Peptic Ulcer in the Aged (Lantern Demonstration).
Henry A. Rafsky, Michael Weingarten and Charles I. Krieger, New York.

Nocturnal Gastric Secretion in Normal Individuals and in Peptic Ulcer (Lantern Demonstration). Ervin Levin, Chicago.

Therapeutic Agents:

Effect of Enterogastrone in Patients with Gastric and Duodenal Ulcer (Lantern Demonstration).
H. M. Pollard and William H. Bachrach, Ann Arbor, Mich.

Aluminum Hydroxide Mixture with Mucin in the Treatment of Peptic Ulcer (Lantern Demonstration).
Leo L. Hardt, Chicago.

Synthetic Resin: A New Antacid for Treatment in Peptic Ulcer (Lantern Demonstration).
Manfred Kraemer and Leo H. Siegel, Newark, N. J.

Discussion on papers of Dr. Feldman, Drs. Rafsky, Weingarten and Krieger, Dr. Levin, Drs. Pollard and Bachrach, Dr. Hardt and Drs. Kraemer and Siegel to be opened by Drs. A. C. Ivy and Lester R. Dragstedt, Chicago; Sara M. Jordan, Boston; Ralph Colp, New York; Walter L. Palmer, Chicago, and Asher Winkelstein, New York.

Favorable and Unfavorable Results of Vagus Nerve Resections in the Treatment of Peptic Ulcer: An Anatomic, Physiologic and Clinical Study (Lantern and Motion Picture Demonstration).
Waltman Walters, Rochester, Minn.
Discussion to be opened by Lester R. Dragstedt, Chicago; Ralph Colp, New York, and Keith S. Grimson, Durham, N. C.

Results of Surgical Treatment for Gastric Ulcer (Lantern Demonstration).
Samuel F. Marshall, Boston, and Mark L. Welch, Dallas, Texas.
Discussion to be opened by Harvey B. Stone, Baltimore, and J. William Hinton, New York.

Complications of Peptic Ulcer (Lantern Demonstration).
Harold L. Thompson, Los Angeles.
Discussion to be opened by Arthur W. Allen, Boston.

SECTION ON OBSTETRICS AND GYNECOLOGY

MEETS IN WESTMINSTER HALL, CHELSEA HOTEL

OFFICERS OF SECTION

Chairman—Alice F. Maxwell, San Francisco.
Vice Chairman—Robert J. Crossen, St. Louis.
Secretary—William F. Mengert, Dallas, Texas.
Executive Committee—Louis E. Phaneuf, Boston; Philip F. Williams, Philadelphia; Alice F. Maxwell, San Francisco.

Wednesday, June 11—9 a. m.

Centennial Address. E. A. Schumann, Philadelphia.

Cervical Cytology in the Diagnosis of Early Cancer.
J. Ernest Ayre, Montreal, Canada.
Discussion to be opened by Charles E. Galloway, Evanston, Ill.

Ectopic Pregnancy (Lantern Demonstration).
W. D. Beacham, New Orleans.

PANEL DISCUSSION ON GYNECOLOGIC BLEEDING

A. H. Curtis, Chicago, Chairman.

Physiologic Basis (Lantern Demonstration).
S. R. M. Reynolds, Baltimore.

Adolescent Bleeding (Lantern Demonstration).
C. F. Fluhmann, San Francisco.

Functional Bleeding. A. H. Curtis, Chicago.

Menopausal Bleeding. J. P. Pratt, Detroit.

Thursday, June 12—9 a. m.

Election of Officers

Chairman's Address: A Medical Inventory.
Alice F. Maxwell, San Francisco.

Effect of Pregnancy on Experimental Renal Hypertension (Lantern Demonstration). Arthur Grollman, Dallas, Texas.

Artificial Vaginas (Motion Picture Demonstration).
V. S. Counseller, Rochester, Minn.
Discussion to be opened by F. H. Falls, Chicago.

PANEL DISCUSSION ON THERAPEUTIC ABORTION

S. A. Cosgrove, Jersey City, N. J., Chairman.

Internist. H. M. Korns, Dubuque, Iowa.

Surgeon. S. C. Harvey, New Haven, Conn.

Neuropsychiatrist. F. G. Ebaugh, Denver.

Obstetrician (Lantern Demonstration).
S. A. Cosgrove, Jersey City, N. J.

Friday, June 13—9 a. m.

Address of Invited Foreign Guest.
J. Heyman, Stockholm, Sweden.

Cesarean Section at General Hospital of Mexico City (Lantern Demonstration). Jose Rabago, Mexico City, Mexico.

Cesarean Hysterectomy (Lantern Demonstration).
William J. Dieckmann, Chicago.
Discussion on papers of Drs. Rabago and Dieckmann to be opened by Nicholson J. Eastman, Baltimore.

PANEL DISCUSSION ON PROBLEMS OF DELIVERY

Philip F. Williams, Philadelphia, Chairman.

Hemorrhage. C. A. Gordon, Brooklyn.

Abnormal Presentation (Lantern Demonstration).
H. Hudnall Ware Jr., Richmond, Va.

SECTION ON OPHTHALMOLOGY

MEETS IN EMBASSY SALON, AMBASSADOR HOTEL

OFFICERS OF SECTION

Chairman—Derrick Vail, Chicago.

Vice Chairman—Warren D. Horner, San Francisco.

Secretary—Robert J. Masters, Indianapolis.

Executive Committee—Conrad Berens, New York; Frederick C. Cordes, San Francisco; Derrick Vail, Chicago.

Wednesday, June 11—2 p. m.

Chairman's Address. Derrick Vail, Chicago.

Address of Invited Foreign Guest. Stewart Duke-Elder, London, England.

Centennial Address. Frederick H. Verhoeff, Boston.

Keratitis Associated with Lymphogranuloma Venereum (Lantern Demonstration).
Harold G. Scheie, Philadelphia; Alan S. Crandall, Salt Lake City, and Werner Henle, Philadelphia.
Discussion to be opened by John P. Macnie, New York, and Garrett L. Sullivan, Boston.

A Five Year Follow-Up of 300 Glaucomatous Eyes (Lantern Demonstration).
Peter C. Kronfeld, Chicago, and Isabelle McGarry, Evanston, Ill.
Discussion to be opened by Algernon B. Reese, New York, and M. Elliott Randolph, Baltimore.

Thursday, June 12—2 p. m.

Executive Session

Election of Officers

The Significance of the Ligament of Lockwood in Relation to Surgery of the Inferior Oblique Muscle (Lantern Demonstration). Walter H. Fink, Minneapolis.
Discussion to be opened by Maynard C. Wheeler, New York.

Streptomycin in Ocular Infections (Lantern Demonstration).
John G. Bellows and Chester J. Farmer, Chicago.
Discussion to be opened by Parker Heath, Detroit, and Irving H. Leopold, Philadelphia.

Unilateral Syphilitic Optic Atrophy (Lantern Demonstration).
Walter L. Bruetsch, Indianapolis.
Discussion to be opened by Cecil S. O'Brien, Iowa City, and Joseph V. Klauder, Philadelphia.

Sodium Sulfacetimide 30 per Cent in Ophthalmology.
Leo L. Mayer, St. Louis.
Discussion to be opened by Phillips Thygeson, San Jose, Calif., and Eugene W. Anthony, Fulton, N. Y.

Demonstration of New Instruments

Friday, June 13—2 p. m.

Congenital Impatency of the Nasolacrimal Duct (Lantern Demonstration).
Edwin L. Kendig Jr. and DuPont Guerry III, Richmond, Va.
Discussion to be opened by J. V. Cassady, South Bend, Ind., and John H. Dunnington, New York.

Intraocular Foreign Bodies: Wartime Experiences Applied to a Peacetime Problem. George M. Haik, New Orleans.
Discussion to be opened by John S. McGavic, Bryn Mawr, Pa., and Frank W. Newell, Chicago.

Military Ophthalmology in the European Theater (Lantern Demonstration). Don Marshall, Kalamazoo, Mich.
Discussion to be opened by F. Phinizy Calhoun Jr., Atlanta, Ga., and Trygve Gunderson, Boston.

Eyelid Reconstruction in the Blinded (Lantern Demonstration).
S. M. *Dupertuis*, Pittsburgh.
Discussion to be opened by Norman L. Cutler, Wilmington, Del., and Frank McDowell, St. Louis.

Surgical Treatment of Congenital Cataract (Lantern Demonstration).
William C. Owens, Baltimore, and William F. Hughes Jr., Indianapolis.
Discussion to be opened by Frederick C. Cordes, San Francisco, and Edward C. Ellett, Memphis, Tenn.

SECTION ON LARYNGOLOGY, OTOLOGY AND RHINOLOGY

MEETS IN EMBASSY SALON, AMBASSADOR HOTEL

OFFICERS OF SECTION

Chairman—J. Mackenzie Brown, Los Angeles.

Vice Chairman—Carl H. McCaskey, Indianapolis.

Secretary—Fletcher D. Woodward, Charlottesville, Va.

Executive Committee—Claude C. Cody, Houston, Texas; Louis H. Clerf, Philadelphia; J. Mackenzie Brown, Los Angeles.

Wednesday, June 11—9 a. m.

Progress in Bronchology. Louis H. Clerf, Philadelphia.
Discussion to be opened by H. B. Orton, Newark, N. J., and H. J. Moersch, Rochester, Minn.

Progress in Esophagology (Lantern Demonstration).
Paul H. Holinger, Chicago.
Discussion to be opened by Fletcher D. Woodward, Charlottesville, Va., and Jerome R. Head, Chicago.

Traumatic Injuries of the Larynx, Especially Gunshot Wounds and Their Repair. Mercer G. Lynch, New Orleans.
Discussion to be opened by Joseph Buchignani, Memphis, Tenn., and J. Wade Youngblood, Dallas, Texas.

Some Technical Procedures in the Treatment of the Cleft Lip and Palate (Lantern Demonstration).
Fred Z. Havens, Rochester, Minn.
Discussion to be opened by Harold S. Vaughan, New York, and Robert H. Ivy, Philadelphia.

Malignant Growths of the Sinuses (Lantern Demonstration).
LeRoy A. Schall, Boston.
Discussion to be opened by Henry B. Orton, Newark, N. J., and C. Stewart Nash, Rochester, N. Y.

Thursday, June 12—9 a. m.

Executive Session

Election of Officers

Chairman's Address: The Future of Otolaryngology.
J. Mackenzie Brown, Los Angeles.

Address of Invited Foreign Guest.
G. Ewart Martin, Edinburgh, Scotland.

Centennial Address: A Brief History of Otolaryngology in the United States, 1847-1947.
Ralph A. Fenton, Portland, Ore.

Neck Surgery in Otolaryngology (Lantern Demonstration).
Carl H. McCaskey, Indianapolis.
Discussion to be opened by August L. Beck, New Rochelle, N. Y., and Joseph D. Kelly, New York.

Lymphatics of the Head and Neck (Lantern and Motion Picture Demonstration). Oscar V. Batson, Philadelphia.
Discussion to be opened by B. P. Widmann, Philadelphia, and Hayes E. Martin, New York.

Friday, June 13—9 a. m.

Surgery of the Seventh Nerve. Thomas G. Tickle, New York.
Discussion to be opened by Frank D. Lathrop, Boston, and Joseph A. Sullivan, Toronto, Canada.

Diseases of the Salivary Glands (Lantern Demonstration).
A. C. Furstenburg, Ann Arbor, Mich.
Discussion to be opened by Dean M. Lierle, Iowa City. and LeRoy A. Schall, Boston.

The Lempert Fenestra Nov-Ovalis Operation for the Restoration of Practical and Serviceable Unaided Hearing (Lantern Demonstration). Julius Lempert, New York.

Discussion to be opened by Marvin F. Jones, New York, and Philip E. Meltzer, Boston.

PANEL DISCUSSION ON DEAFNESS

Francis L. Lederer, Chicago, Moderator.
Edward H. Truex, Hartford, Conn.
Raymond Carhart, Evanston, Ill.
Eva Thompson, Philadelphia.
Herbert Koepp-Baker, Chicago (Lantern Demonstration).
Charles E. Kinney, Cleveland.

Each participant will answer three vital questions to show *what* one can do to rehabilitate the patient with a hearing impairment, and *how* one can do it.

SECTION ON PEDIATRICS

MEETS IN BALLROOM, CONVENTION HALL

OFFICERS OF SECTION

Chairman—Gilbert J. Levy, Memphis, Tenn.

Vice Chairman—Charles A. Weymuller, Brooklyn.

Secretary—Margaret Mary Nicholson, Washington, D. C.

Executive Committee—Hugh L. Dwyer, Kansas City, Mo.; John Aikman, Rochester, N. Y.; Gilbert J. Levy, Memphis, Tenn.

Wednesday, June 11—2 p. m.

An Analysis of Newborn Mortality and Morbidity, with Controls in New York, Philadelphia and Memphis, with Continuous Caudal Analgesia (Lantern Demonstration).
Robert A. Hingson, Frank E. Whitacre and H. Charles Franklin, Memphis, Tenn.
Discussion to be opened by James G. Hughes, Memphis, Tenn., and George J. Andros, Chicago.

Medical Management of Whooping Cough in Infants (Lantern Demonstration).
Jerome L. Kohn and Alfred E. Fischer, New York.
Discussion to be opened by Ruth G. Aleman, New Orleans, and L. Nellis Silverthorne, Toronto, Canada.

Cerebral Complications in Pertussis (Lantern Demonstration).
Abraham M. Litvak and Harry Gibel, Brooklyn.
Discussion to be opened by Benjamin Kramer and Philip Rosenblatt, Brooklyn.

Encephalitis as a Causative Factor in Behavior Disorders in Children (Lantern Demonstration).
J. Victor Greenebaum and Louis A. Lurie, Cincinnati.
Discussion to be opened by Charles Bradley, East Providence, R. I., and Oscar Reiss, Los Angeles.

Electroencephalographic Studies in Acute Poliomyelitis (Lantern Demonstration).
Alton Goldbloom, Montreal, Canada.
Discussion to be opened by M. G. Peterman, Milwaukee, and David Bodian, Baltimore.

Allergy to Milk.
Preston A. McLendon and Dorothy S. Jaeger-Lee, Washington, D. C.
Discussion to be opened by W. Ambrose McGee, Richmond, Va., and William F. Matthews, Montclair, N. J.

Thursday, June 12—2 p. m.

Election of Officers

Problems in Management of Tick Typhus (Rocky Mountain Spotted Fever) in Childhood (Lantern Demonstration).
Weston M. Kelsey and George T. Harrell Jr., Winston-Salem, N. J.
Discussion to be opened by Robert Joseph Huebner, Kensington, Md., and David M. Greeley, New York.

Address of Invited Foreign Guest: Deleterious Results of Overdosage of Vitamin D_2 During Infancy.
Robert Debré, Paris, France.

Centennial Address: Progress in Pediatrics.
Edgar P. Copeland, Washington, D. C.

Congenital Atresia of the Esophagus with Tracheoesophageal Fistula (Lantern Demonstration).
Cameron Haight, Ann Arbor, Mich.
Discussion to be opened by Brian B. Blades, Washington, D. C., and Conrad R. Lam, Detroit.

Psychotherapy in Pediatrics.
Dorothy Donley-Dowd, Washington, D. C.
Discussion to be opened by Earl H. Baxter, Columbus, Ohio.

Causes of Death in 13,000 Admissions (Lantern Demonstration).
Ralph V. Platou, New Orleans.

Friday, June 13—2 p. m.

Clinical Application of a Laboratory Method for the Selection of Antibiotic Therapy.
Robert H. High, Earl H. Spaulding, Amedeo Bondi and Waldo E. Nelson, Philadelphia.
Discussion to be opened by Paul C. Bucy, Chicago.

Some Practical Measures for the Reduction of Morbidity and Mortality in Premature Infants (Lantern Demonstration).
Lewis A. Koch, Brooklyn.
Discussion to be opened by Ethel C. Dunham, Washington, D. C.

Rheumatic Fever in Childhood (Lantern Demonstration).
William Weston Jr., Columbia, S. C.
Discussion to be opened by Ira Gore, Washington, D. C.; Stanley Gibson, Chicago, and Rachel Ash, Philadelphia.

Immunologic Studies in Mumps (Lantern Demonstration).
Harriet Davis, Joseph Stokes Jr., John F. Enders, Gertrude Henle and Elizabeth P. Maris, Philadelphia.
Discussion to be opened by Karl Habel, Bethesda, Md.

Lye Poisoning in Children (Lantern Demonstration).
Wallace Kernodle, Grant Taylor and Wilburt C. Davison, Durham, N. C.
Discussion to be opened by John Aikman, Rochester, N. Y.

SECTION ON EXPERIMENTAL MEDICINE AND THERAPEUTICS

MEETS IN WEDGEWOOD ROOM, CHELSEA HOTEL

OFFICERS OF SECTION

Chairman—Carl A. Dragstedt, Chicago.

Vice Chairman—Walter Bauer, Boston.

Secretary—Dwight L. Wilbur, San Francisco.

Executive Committee—Tinsley R. Harrison, Dallas, Texas; E. V. Allen, Rochester, Minn.; Carl A. Dragstedt, Chicago.

Wednesday, June 11—2 p. m.

Centennial Address: The Macrocytic Anemias.
George R. Minot, Boston.

SYMPOSIUM ON THE USE OF NEWER DRUGS

Asymetrine Hydrobromide in the Treatment of Gastroenteric Hypermotility (Lantern Demonstration).
Robert A. Woodbury, George P. Child, G. Frank Jones Jr., and Richard Torpin, Augusta, Ga.

The Use of Nitrogen Mustards in the Treatment of Disease (Lantern Demonstration). Leon O. Jacobsen, Chicago.

Stilbamidine in the Treatment of Multiple Myeloma (Lantern Demonstration). Isidore Snapper, New York.

BAL Therapy in Arsenic and Mercury Poisoning (Lantern Demonstration).
John Luetscher and Warfield T. Longcope, Baltimore.

Use of Antihistaminic Drugs.
Francis M. Rackemann, Boston.
Discussion to be opened by Franklin A. Kyser, Evanston, Ill.

Thursday, June 12—2 p. m.

Election of Officers

Address of Invited Foreign Guest: Blood Pressure Homeostatis and Circulatory Failure (Shock) (Lantern Demonstration).
C. Heymans, Ghent, Belgium.

Chairman's Address: Idiosyncrasy to Drugs.
Carl A. Dragstedt, Chicago.

Effects of Smoking Cigarets on the Heart in Normal Persons and in Cardiac Patients (Lantern Demonstration).
Robert L. Levy and John L. Nickerson, New York.
Discussion to be opened by Harold J. Stewart, New York; Arlie R. Barnes, Rochester, Minn., and David Adlersberg, New York.

The Use of Anticoagulants in the Treatment of Heart Disease.
Irving S. Wright and William T. Foley, New York.
Discussion to be opened by Leo Loewe, Brooklyn, and E. V. Allen, Rochester, Minn.

Preliminary Observation of the Effect of Thoracic Sympathectomy on Heart Rate (Lantern Demonstration).
Earle M. Chapman, Dera Kinsey, William P. Chapman and Reginald H. Smithwick, Boston.

Friday, June 13—9 a. m.

JOINT MEETING WITH SECTION ON INTERNAL MEDICINE IN BALLROOM OF CONVENTION HALL

Address of Invited Foreign Guest, Section on Internal Medicine: The Contribution of the Laboratory to the Differential Diagnosis of Jaundice.
Hector Ducci Claro, Santiago, Chile.

Centennial Address of Section on Internal Medicine: History of Internal Medicine in the United States (Lantern Demonstration).
Reginald Fitz, Boston.

PANEL DISCUSSION ON RECENT ADVANCES IN TREATMENT

Morris Fishbein, Moderator

Virus Diseases.
Thomas M. Rivers, New York.

Gastrointestinal Diseases (Lantern Demonstration).
Henry L. Bockus, Philadelphia.

Cardiovascular Diseases.
Arlie R. Barnes, Rochester, Minn.

Cancer.
Cornelius P. Rhoads, New York.

Blood Diseases.
Russell L. Haden, Cleveland.

Infectious Diseases (Lantern Demonstration).
Chester S. Keefer, Boston.

Pulmonary Disease.
James J. Waring, Denver.

Endocrinology (Lantern Demonstration).
Willard O. Thompson, Chicago.

SECTION ON PATHOLOGY AND PHYSIOLOGY

MEETS IN WEDGEWOOD ROOM, CHELSEA HOTEL

OFFICERS OF SECTION

Chairman—J. J. Moore, Chicago.
Vice Chairman—Alvin G. Foord, Pasadena, Calif.
Secretary—Frank W. Hartman, Detroit.
Executive Committee—Frank C. Mann, Rochester, Minn.; Virgil H. Moon, Philadelphia; J. J. Moore, Chicago.

Wednesday, June 11—9 a. m.

The Present Status of the Therapy of Experimental Renal Hypertension (Lantern Demonstration).
G. E. Wakerlin, Chicago.

Tumors of the Carotid Gland: A Review (Lantern Demonstration).
Walter L. Bierring and Richard F. Birge, Des Moines, Iowa.

Chairman's Address: The Practice of Pathology.
J. J. Moore, Chicago.

Address of Invited Foreign Guest: Regulation of the Arterial *Pulmonary Pressure.*
Göran Liljestrand, Stockholm, Sweden.

Centennial Address: American Giants of Pathology.
Howard T. Karsner, Cleveland.

Medical Aspects of the Atomic Bomb (Lantern Demonstration).
R. H. Draeger, Washington, D. C.

Various Phases of the Use of Streptomycin in Tuberculosis (Lantern Demonstration).
H. J. Corper, Denver.

Thursday, June 12—9 a. m.

Election of Officers

SYMPOSIUM ON VIRUS DISEASES

The Physician and the Virus Diagnostic Laboratory (Lantern Demonstration).
Joseph E. Smadel, Washington, D. C.

The Electron Microscopy of Viruses.
Ralph W. G. Wyckoff, Washington, D. C.

Common Virus Infections of the Respiratory Tract (Lantern Demonstration).
John H. Dingle, Cleveland.

Search for Extrahuman Sources of Poliomyelitis Virus.
Thomas Francis Jr. and Gordon C. Brown, Ann Arbor, Mich.

Viruses and Virus-like Agents as Causes of Cancer (Lantern Demonstration).
John G. Kidd, New York.

The Present Status of Viruses and Virus Diseases.
E. W. Schultz, Stanford University, Calif.

Friday, June 13—9 a. m.

SYMPOSIUM ON THE PRESENT STATUS OF CANCER RESEARCH

Cancer as an Autoparasite.
R. R. Spencer, Washington, D. C.

The Biologic Assessment of Tumor Potentialities (Lantern Demonstration).
Henry S. N. Greene, New Haven, Conn.

Epidermal Carcinogenesis (Lantern Demonstration).
E. V. Cowdry, St. Louis.

Some Current Trends in Cancer Chemotherapy (Lantern Demonstration).
M. J. Shear, Washington, D. C.

Radioactive Isotopes in the Diagnosis and Treatment of Malignant Disease.
Shields Warren, Boston

SECTION ON NERVOUS AND MENTAL DISEASES

MEETS IN ST. DENNIS ROOM, ST. DENNIS HOTEL

OFFICERS OF SECTION

Chairman—Roland P. Mackay, Chicago.
Vice Chairman—Louis J. Karnosh, Cleveland.
Secretary—Frederick P. Moersch, Rochester, Minn.
Executive Committee—J. M. Nielsen, Los Angeles; Percival Bailey, Chicago; Roland P. Mackay, Chicago.

Wednesday, June 11—2 p. m.

Spontaneous Subarachnoid Hemorrhage of Aneurysmal Origin; Factors Influencing Prognosis: An Analysis of 130 Cases (Lantern Demonstration).
Wallace B. Hamby, Buffalo.
Discussion to be opened by J. C. Richardson, Toronto, Canada, and I. S. Wechsler, New York.

Address of Invited Foreign Guest.
Thierry Alajouanine, Paris, France.

The Program for the Activation of Neurology Under the Veterans Administration.
Pearce Bailey, Washington, D. C.
Discussion to be opened by J. M. Nielsen, Los Angeles, and Percival Bailey, Chicago.

Ischemia of Peripheral Nerves: Experimental and Clinical Studies on the Role of the Vasa Nervorum (Lantern Demonstration).
Joseph T. Roberts, Washington, D. C.
Discussion to be opened by Louis J. Karnosh and Joseph L. Fetterman, Cleveland.

Surgical Treatment of Intractable Unilateral Cephalalgia (Lantern Demonstration).
Walter G. Haynes, Birmingham, Ala.
Discussion to be opened by Roland P. Mackay and Percival Bailey, Chicago.

A Survey of the Value of Neurosurgical Treatment for the Relief of Intractable Pain.
Henry T. Wycis and Michael Scott, Philadelphia.

Thursday, June 12—2 p. m.

Election of Officers

Centennial Address: One Hundred Years of Progress in Neurology, Neurologic Surgery and Psychiatry (Lantern Demonstration). Stanley Cobb, Boston.

The Historical Contribution of Neurophysiology to Neuropsychiatry (Lantern Demonstration).
John F. Fulton, New Haven, Conn.
Discussion to be opened by Henry R. Viets, Boston, and Percival Bailey, Chicago.

Neurosurgery (and the Neurosurgeon) in World War II.
R. Glen Spurling, Louisville, Ky.

Surgical Experience with Pituitary Tumors.
Francis C. Grant, Philadelphia.
Discussion to be opened by James L. Poppen, Boston, and Edgar A. Kahn, Ann Arbor, Mich.

Friday, June 13—2 p. m.

Chairman's Address: The Neurologist Looks at Discipline.
Roland P. Mackay, Chicago.

Research Leads in Contemporary Neurochemistry.
Nolan D. C. Lewis, New York.

Personality and Illness.
Karl M. Bowman and Jurgen Ruesch, San Francisco.
Discussion to be opened by Harold G. Wolff, New York, and Franz G. Alexander, Chicago.

Common Emotional Disturbances in the First Two Years of Life. Benjamin McLane Spock, Rochester, Minn.
Discussion to be opened by Karl M. Bowman, San Francisco.

The Organic Paranoid Syndrome (Lantern Demonstration).
George N. Thompson and J. M. Nielsen, Los Angeles.
Discussion to be opened by S. Bernard Wortis, New York, and Harry C. Solomon, Boston.

SECTION ON DERMATOLOGY AND SYPHILOLOGY

MEETS IN WEDGEWOOD ROOM, MARLBOROUGH-BLENHEIM HOTEL

OFFICERS OF SECTION

Chairman—Nelson Paul Anderson, Los Angeles.
Vice Chairman—George C. Andrews, New York.
Secretary—Clinton W. Lane, St. Louis.
Executive Committee—Clark W. Finnerud, Chicago; Clyde L. Cummer, Cleveland; Nelson Paul Anderson, Los Angeles.

Wednesday, June 11—2 p. m.

Chairman's Address: Cysts, Sinuses and Fistulas of Dermatologic Interest (Lantern Demonstration).
Nelson Paul Anderson, Los Angeles.

Address of Invited Foreign Guest: Dermatology; The International Outlook.
R. M. B. MacKenna, London, England.

Centennial Address: One Hundred Years' Progress in Dermatology. Oliver S. Ormsby, Chicago.

Sarcoidosis: A Present Day Appraisal (Lantern Demonstration). Henry E. Michelson, Minneapolis.
Discussion to be opened by Fred D. Weidman, Philadelphia, and Arthur C. Curtis, Ann Arbor, Mich.

Pemphigus: Experimental and Clinical Studies on the Etiology, Diagnosis and Therapy (Lantern Demonstration).
David I. Macht and Marcus Ostro, Baltimore.

The Causative Agent of Pemphigus Vulgaris (Lantern Demonstration). Arthur W. Grace, Brooklyn.
Discussion on papers of Drs. Macht and Ostro and Dr. Grace to be opened by Richard S. Weiss, St. Louis, and Walter F. Lever, Boston.

Dermatologic Manifestations as Presenting Symptoms of Psychiatric States.
Theodore Cornbleet and Meyer Brown, Chicago.
Discussion to be opened by Marion B. Sulzberger, New York, and H. Hanford Hopkins, Baltimore.

Thursday, June 12—2 p. m.

Election of Officers

Streptomycin in the Therapy of Granuloma Inguinale (Lantern Demonstration).
H. S. Kupperman, R. B. Greenblatt and R. B. Dienst, Augusta, Ga.
Discussion to be opened by Robert R. Kierland, Rochester, Minn., and Donald M. Pillsbury, Philadelphia.

Centennial Address: One Hundred Years' Progress in Syphilis.
Paul A. O'Leary, Rochester, Minn.

Oral Bismuth Therapy in Syphilis and Various Inflammatory Dermatoses (Lantern Demonstration).
James K. Howles, New Orleans, and E. R. Gross, Philadelphia.
Discussion to be opened by Dudley C. Smith, Charlottesville, Va., and Arthur W. Neilson, St. Louis.

The Importance of Circumcision in Prevention of Venereal Disease and Certain Forms of Cancer (Lantern Demonstration). Eugene A. Hand, Saginaw, Mich.
Discussion to be opened by John E. Rauschkolb, Cleveland, and Francis A. Ellis, Baltimore.

The Chemotherapy of Leprosy (Lantern Demonstration).
G. H. Faget and Paul T. Erickson, Carville, La.
Discussion to be opened by Harold M. Johnson, Honolulu, Hawaii, and M. T. Van Studdiford, New Orleans.

Clinical Problems in Penicillin Sensitivity (Lantern Demonstration).
Samuel M. Peck, Sheppard Siegel, Arthur W. Glick and Abner Kurtin, New York.
Discussion to be opened by Harold N. Cole, Cleveland, and E. Myles Standish, Hartford, Conn.

Friday, June 13—2 p. m.

Autosensitization Dermatitis.
H. J. Templeton, C. J. Lunsford and H. V. Allington, Oakland, Calif.
Discussion to be opened by C. F. Lehmann, San Antonio, Texas, and Everett R. Seale, Houston, Texas.

Nitrogen Mustards in the Treatment of Malignant Blastomas (Lantern Demonstration).
Earl D. Osborne, James W. Jordon, Frank C. Hoak Jr. and Francis J. Pschierer, Buffalo.
Discussion to be opened by Charles Spurr, Chicago, and Leon Goldman, Cincinnati.

The Technic and Problems of Roentgen Ray Epilation.
Howard T. Behrman and Frank C. Combes, New York.
Discussion to be opened by Anthony C. Cipollaro, New York, and A. H. Lancaster, Knoxville, Tenn.

The Relation of Exit Dose and Other Dosage Factors to Roentgen Injuries.
June C. Shafer, Carl B. Braestrup and Jerome K. Fisher, New York.
Discussion to be opened by C. Guy Lane, Boston, and Onis G. Hazel, Oklahoma City.

Injection Therapy for Angiomas (Lantern Demonstration).
G. Marshall Crawford, Boston.

Discussion to be opened by Harry F. Anderson, Washington, D. C., and Henry C. Shaw, Rochester, N. Y.

The Use of Liquid Oxygen in Dermatology.
Roy L. Kile and Ashton L. Welsh, Cincinnati.

Discussion to be opened by Howard Hailey, Atlanta, Ga., and Allen W. Pepple, Richmond, Va.

SECTION ON PREVENTIVE AND INDUSTRIAL MEDICINE AND PUBLIC HEALTH

MEETS IN TRELLIS ROOM, RITZ-CARLTON HOTEL

OFFICERS OF SECTION

Chairman—Clarence O. Sappington, Chicago.

Vice Chairman—R. H. Riley, Baltimore.

Secretary—Rutherford T. Johnstone, Los Angeles.

Executive Committee—Joseph W. Mountin, Washington, D. C.; E. L. Stebbins, New York; Clarence O. Sappington, Chicago.

Wednesday, June 11—9 a. m.

Chairman's Address. Clarence O. Sappington, Chicago.

Centennial Address. Clarence D. Selby, Detroit.

SYMPOSIUM ON HOW CAN QUALIFIED MEDICAL TESTIMONY (SCIENTIFIC PROOF) BE ATTAINED IN WORKMEN'S COMPENSATION CONTROVERSY?

J. W. Holloway Jr., Chicago, Moderator.
D. J. Galbraith, Toronto, Canada.
George N. Edson, Jackson Heights, N. Y.
Carey P. McCord, Detroit.
A. G. Kammer, New York.
W. G. Workman, Tracy, Minn.
Theodore C. Waters, Baltimore.

Discussion on symposium to be opened by Rollin E. Talbert, New York; Henry H. Kessler, Newark, N. J., W. H. Nickels Jr., Richmond, Va., and Frederick W. Slobe, Chicago, followed by participation by audience.

Thursday, June 12—9 a. m.

Election of Officers

The Longevity and Mortality of American Physicians (Lantern Demonstration). Louis I. Dublin, New York.

Address of Invited Foreign Guest: Comparative Practices in Industrial Medicine in Sweden and in the United States.
Sven Forssman, Tomtedoda, Sweden.

SYMPOSIUM ON THE NEED FOR INDUSTRIAL HEALTH EDUCATION, HOW, WHEN AND TO WHAT EXTENT

Robert A. Kehoe, Cincinnati, Moderator.
W. S. McEllroy, Pittsburgh.
J. M. Carlisle, Rahway, N. J.
Leonard J. Goldwater, New York.
Henry F. Vaughan, Ann Arbor, Mich.
James H. Sterner, Rochester, N. Y.
W. C. L. Hemeon, Pittsburgh (Lantern Demonstration)

Discussion on symposium to be opened by Raymond Hussey, Detroit; Russell L. Haden, Cleveland and T. Lyle Hazlett, Pittsburgh, followed by participation by audience.

Friday, June 13—9 a. m.

The Diagnosis of DDT Poisoning.
Paul A. Neal, Bethesda, Md.

New Incisions and Technic in Peripheral Nerve Surgery (Lantern Demonstration). Emil Seletz, Los Angeles.

Preliminary Report on Schick Test Toxin Not Requiring Control in Adults (Lantern Demonstration).
Victor Ross, New York.

Studies of Diphtheria Immunization in Young Infants with Multiple Antigen (Lantern Demonstration).
Joseph A. Bell, Bethesda, Md.

Hookworm Infections in American Servicemen, with Reference to the Establishment of Ancylostoma Duodenale in the Southern United States (Lantern Demonstration).
Elmer H. Loughlin, Brooklyn.

The Development of a Blood and Blood Derivatives Program (Lantern Demonstration). Geoffrey Edsall, Boston.

Health Conditions in the Cemented Tungsten Carbide Industry.
L. T. Fairhall and H. T. Castberg, Bethesda, Md.

SECTION ON UROLOGY

MEETS IN WEDGEWOOD ROOM, MARLBOROUGH-BLENHEIM HOTEL

OFFICERS OF SECTION

Chairman—Grayson Carroll, St. Louis.

Vice Chairman—Clark M. Johnson, San Francisco.

Secretary—Edward N. Cook, Rochester, Minn.

Executive Committee—Gershon J. Thompson, Rochester, Minn.; Arbor D. Munger, Lincoln, Neb.; Grayson Carroll, St. Louis.

Wednesday, June 11—9 a. m.

The Problem of the Posteriorly Located Renal Pelvis Associated with Ptosis (Lantern Demonstration).
William P. Herbst, Washington, D. C.

Ureteropelvic Obstructions: Symptoms and Treatment (Lantern Demonstration). Roy B. Henline, New York.

Prostatic Surgery and Heart Disease (Lantern Demonstration).
Herman L. Kretschmer, Chicago.

Centennial Address: One Hundred Years in Urology (Lantern Demonstration).
William F. Braasch, Rochester, Minn.

Tumors of the Testicle (Lantern Demonstration).
Lloyd G. Lewis, Washington, D. C.

Tumors of the Testicle.
Hans R. Sauer, Ernest M. Watson and Eugene M. Burke, Buffalo.

Primary Carcinoma of the Seminal Vesicles; Differentiation from Extrarectal and Rectal Carcinoma: A Comparative Study (Lantern Demonstration).
Lowrain E. McCrea, Philadelphia.

Thursday, June 12—9 a. m.

Election of Officers

Disappearance of Carcinomatous Ulceration of the Bladder Following Bilateral Ureterosigmoidostomy (Lantern Demonstration). Edwin Davis, Omaha.

Twenty-Five Years of Radon Implantation for Bladder Cancer: Five Year Results.
Benjamin S. Barringer, New York.

Cystectomy for Carcinoma of the Bladder (Lantern Demonstration). Charles C. Higgins, Cleveland.

Chairman's Address: A Study of Pyocyaneus and Aerobacter Aerogenes in Urinary Infections (Lantern Demonstration). Grayson Carroll, St. Louis.

Address of Invited Foreign Guest (Lantern Demonstration).
Frank S. Patch, Montreal, Canada.

Pheochromocytoma (Lantern Demonstration).
George F. Cahill, New York.

Friday, June 13—9 a. m.

Surgical Management of Impacted Stone in the Lower Ureter (Lantern Demonstration).
Hamilton W. McKay and Kenneth M. Lynch Jr., Charlotte, N. C.

Management of Recurrent Formation of Renal Calculi (Lantern Demonstration). J. C. Kimbrough, Washington, D. C.

Hyaluronidase (Lantern Demonstration). W. W. Scott, Baltimore.

Cystourethrography in Children (Lantern Demonstration). M. Leopold Brodny, Boston.

SECTION ON ORTHOPEDIC SURGERY

MEETS IN ST. DENNIS ROOM, DENNIS HOTEL

OFFICERS OF SECTION

Chairman—Francis M. McKeever, Los Angeles.

Vice Chairman—J. Warren White, Greenville, S. C.

Secretary—Joseph S. Barr, Boston.

Executive Committee—Guy A. Caldwell, New Orleans; Theodore A. Willis, Cleveland; Francis M. McKeever, Los Angeles.

Wednesday, June 11—9 a. m.

PANEL DISCUSSION ON FRACTURES OF UPPER END OF THE FEMUR

Philip D. Wilson, New York, Moderator

Treatment of Acute Fractures of the Neck of the Femur (Lantern Demonstration). George W. Van Gorder, Boston.

Management of Intertrochanteric Fracture of the Femur. Mather Cleveland, D. M. Bosworth and F. R. Thompson, New York.

Medical Management of the Patient with a Fractured Hip (Lantern Demonstration). Richard H. Freyberg, New York.

Cause, Development and Treatment of Aseptic Necrosis of the Femoral Head Following Fracture of the Hip (Lantern Demonstration). Carl E. Badgley, Ann Arbor, Mich.

Results of Treatment of Fractures of the Upper End of the Femur (Lantern Demonstration). Harold B. Boyd, Memphis, Tenn.

Treatment of Ununited Fractures of the Femur (Lantern Demonstration). J. A. Dickson, Cleveland.

Thursday, June 12—9 a. m.

Election of Officers

Internal Derangements of the Knee (Lantern Demonstration). Paul R. Lipscomb, Melvin S. Henderson and Ralph E. DeForest, Rochester, Minn.

Discussion to be opened by Mather Cleveland, New York, and E. F. Cave, Boston.

Chairman's Address (Lantern Demonstration). Francis M. McKeever, Los Angeles.

The Treatment of Slipped Capital Femoral Epiphyses (Lantern Demonstration). Armin Klein, Robert J. Joplin and John A. Reidy, Boston.

Discussion to be opened by H. R. McCarroll, St. Louis, and H. Earle Conwell, Birmingham, Ala.

Centennial Address. Edwin W. Ryerson, Chicago.

Friday, June 13—9 a. m.

Massive Bone Grafts for the Restoration of Bone Defects in Long Bone. Carlo S. Scuderi, Chicago.

Discussion to be opened by T. C. Thompson, New York, and Francis E. West, San Diego, Calif.

The Value of Conservative Management in Cervicobrachial Pain (Lantern Demonstration). G. Edmund Haggart, Boston.

Discussion to be opened by I. W. Nachlas, Baltimore, and James McAteer, New York.

Address of Invited Foreign Guest. Jose Valls, Buenos Aires, Argentina.

The Bone Bank (Lantern Demonstration). Leonard F. Bush, Danville, Pa., and C. Zent Garber, New York.

Discussion to be opened by John R. Cobb, New York, and Ralph K. Ghormley, Rochester, Minn.

Experimental Production of Aseptic Necrosis (Lantern Demonstration). Paul C. Colonna, Philadelphia.

Discussion to be opened by Carl E. Badgley, Ann Arbor, Mich., and Dallas B. Phemister, Chicago.

SECTION ON GASTRO-ENTEROLOGY AND PROCTOLOGY

MEETS IN TRELLIS ROOM, RITZ-CARLTON HOTEL

OFFICERS OF SECTION

Chairman—Martin S. Kleckner, Allentown, Pa.

Vice Chairman—Sara M. Jordan, Boston.

Secretary—Grant H. Laing, Chicago.

Executive Committee—Emmett H. Terrell, Richmond, Va.; J. A. Bargen, Rochester, Minn.; Martin S. Kleckner, Allentown, Pa.

Wednesday, June 11—2 p. m.

Results of Treatment of Esophageal Varices by Injection of Sclerosing Solution (Lantern Demonstration). H. J. Moersch, Rochester, Minn.

Discussion to be opened by Cecil O. Patterson, Dallas, Texas.

Congenital Gallbladder Anomalies (Lantern Demonstration). Bruce C. Lockwood, Detroit.

SYMPOSIUM ON LIVER DISEASE

Diagnostic Aspects:

Address of Invited Foreign Guest: A Review of Some Clinical and Biochemical Problems of Liver Disease as Revealed by Systematic Biopsy Studies. John McMichael, London, England.

The Accuracy of Diagnosis of Jaundice (Lantern Demonstration). William F. Lipp and A. H. Aaron, Buffalo.

Differential Diagnosis of Hepatitis by Histologic and Functional Laboratory Methods (Lantern Demonstration). Hans Popper and Murray Franklin, Chicago.

Therapeutic Aspects:

The Efficacy of Lipotrophic Substances in the Treatment of Liver Cirrhosis (Lantern Demonstration). Frederick Steigmann, Chicago.

Discussion to be opened by Cecil J. Watson, Minneapolis.

Centennial Address: The History of Progress in Our Knowledge of the Digestive Tract During the Last Century. J. A. Bargen, Rochester, Minn.

SYMPOSIUM ON PANCREAS

Chronic Pancreatitis Causing Complete and Incomplete Obstruction of the Common Duct: Report of Illustrative Cases (Lantern Demonstration). Moses Behrend, Philadelphia.

Diagnostic Criteria of Carcinoma of the Pancreas (Lantern Demonstration). Grayson F. Dashiell, Chicago.

Functional Efficiency of the Gastrointestinal Tract Following Resection of the Head of the Pancreas (Whipple Operation): Effect of (1) Anastomosing Remaining Pancreas to the Jejunum; (2) Administration of Pancreatin; (3) Variations of the Fat and Nitrogen Content of the Diet (Lantern Demonstration).
Eric E. Wollaeger, Manfred W. Comfort, Arnold E. Osterberg and O. Theron Clagett, Rochester, Minn.

Discussion to be opened by Allen O. Whipple, New York, and Robert Elman, St. Louis.

Thursday, June 12—2 p. m.

Election of Officers

Chairman's Address: Proctologic Surgery of the Large Bowel (Lantern Demonstration).
Martin S. Kleckner, Allentown, Pa.

The Proctologic Examination of Infants and Children (Lantern Demonstration). Saul Schapiro, Brooklyn.

Anterior Pilonidal Cyst (Lantern Demonstration).
Tom E. Smith, Dallas, Texas.

The Preparation and After-Care of the Patient Undergoing Surgery of the Lower Bowel.
Harry E. Bacon and Robert J. Rowe, Philadelphia.
Discussion to be opened by Frank H. Lahey, Boston, and Louis A. Buie, Rochester, Minn.

SYMPOSIUM ON ULCERATIVE COLITIS

Clinical Aspects:

The Etiologic Diagnosis of Ulcerative Colitis (Lantern Demonstration).
William Z. Fradkin, Brooklyn.

Certain Clinical Aspects of Ulcerative Colitis (Lantern Demonstration). J. B. Kirsner, Chicago.

Treatment:

Total Parenteral Alimentation and Therapy in Ulcerative Colitis: Its Place in Management (Lantern Demonstration). Moses Paulson, Baltimore.

The Surgical Treatment of Ulcerative Colitis (Lantern Demonstration). Richard B. Cattell, Boston.
Discussion to be opened by J. A. Bargen, Rochester, Minn., and E. N. Collins, Cleveland.

SYMPOSIUM ON GASTRITIS AND GASTRIC NEOPLASMS

Therapy of Chronic Atrophic Gastritis with Seven Years' Gastroscopic Control (Lantern Demonstration).
Leonidas H. Berry and T. Jonathan Cole, Chicago.

Clinical Distinctions Between Gastric Sarcoma and Carcinoma, with Special Reference to the Infiltrating Types of Sarcomas (Lantern Demonstration).
Anthony Bassler, New York.

The Prognosis in Gastric Cancer (Lantern Demonstration).
Samuel N. Maimon, Chicago.

Blood Pattern in Presymptomatic Malignancy of the Gastrointestinal Tract (Lantern Demonstration).
H. Leonard Bolen, Fall River, Mass.
Discussion to be opened by Charles Alexander Lamb, Boston, and Hyman I. Goldstein, Camden, N. J.

Friday, June 13—2 p. m.

JOINT MEETING WITH SECTION ON SURGERY, GENERAL AND ABDOMINAL, IN WESTMINSTER HALL, CHELSEA HOTEL

SYMPOSIUM ON PEPTIC ULCER

Statistical Study of Over 1,000 Cases of Peptic Ulcer (Lantern Demonstration). Maurice Feldman, Baltimore.

Onset of Peptic Ulcer in the Aged (Lantern Demonstration).
Henry A. Rafsky, Michael Weingarten and Charles I. Krieger, New York.

Nocturnal Gastric Secretion in Normal Individuals and in Peptic Ulcer (Lantern Demonstration). Ervin Levin, Chicago.

Therapeutic Agents:

Effect of Enterogastrone in Patients with Gastric and Duodenal Ulcer (Lantern Demonstration).
H. M. Pollard and William H. Bachrach, Ann Arbor, Mich.

Aluminum Hydroxide Mixture with Mucin in the Treatment of Peptic Ulcer (Lantern Demonstration).
Leo L. Hardt, Chicago.

Synthetic Resin: A New Antacid for Treatment in Peptic Ulcer (Lantern Demonstration).
Manfred Kraemer and Leo H. Siegel, Newark, N. J.

Discussion on papers of Dr. Feldman, Drs. Rafsky, Weingarten and Krieger, Dr. Levin, Drs. Pollard and Bachrach, Dr. Hardt and Drs. Kraemer and Siegel to be opened by Drs. A. C. Ivy and Lester R. Dragstedt, Chicago; Sara M. Jordan, Boston; Ralph Colp, New York; Walter L. Palmer, Chicago, and Asher Winkelstein, New York.

Favorable and Unfavorable Results of Vagus Nerve Resections in the Treatment of Peptic Ulcer: An Anatomic, Physiologic and Clinical Study (Lantern and Motion Picture Demonstration).
Waltman Walters, Rochester, Minn.
Discussion to be opened by Lester R. Dragstedt, Chicago; Ralph Colp, New York, and Keith S. Grimson, Durham, N. C.

Results of Surgical Treatment for Gastric Ulcer (Lantern Demonstration).
Samuel F. Marshall, Boston, and Mark L. Welch, Dallas, Texas.
Discussion to be opened by Harvey B. Stone, Baltimore, and J. William Hinton, New York.

Complications of Peptic Ulcer (Lantern Demonstration).
Harold L. Thompson, Los Angeles.
Discussion to be opened by Arthur W. Allen, Boston.

SECTION ON RADIOLOGY

MEETS IN ROOM 20, CONVENTION HALL

OFFICERS OF SECTION

Chairman—Bernard P. Widmann, Philadelphia.
Vice Chairman—W. Walter Wasson, Denver.
Secretary—U. V. Portmann, Cleveland.
Executive Committee—Robert A. Arens, Chicago; Edwin C. Ernst, St. Louis; Bernard P. Widmann, Philadelphia.

Wednesday, June 11—2 p. m.

Business Session

Address of Invited Foreign Guest: The Question of Cardiac Hypertrophy in Residents of High Altitudes: Radiologic Study Conducted at 8,636 Feet Above Sea Level.
Gonzalo Esguerra Gomez, Bogota, Colombia, South America.

Centennial Address: Contributions of Radiology to the Diagnosis and Treatment of Disease.
George W. Holmes, Boston.

Routine Roentgen Examination of the Stomach of Symptomless Individuals (Lantern Demonstration).
Leo G. Rigler, Minneapolis.
Discussion to be opened by Ross Golden, New York.

Nonneoplastic Intracranial Calcification: Roentgenologic Manifestations (Lantern Demonstration).
John D. Camp, Rochester, Minn.
Discussion to be opened by Eugene P. Pendergrass, Philadelphia.

Clinical Manifestations of Disease Masked or Modified by Chemotherapy: Increasing Responsibility of the Roentgenologist (Lantern Demonstration).
Vincent W. Archer, George Cooper and Norman Adair, University, Va.
Discussion to be opened by George M. Wyatt, Washington, D. C.

Fundamental Concepts of Radiographic Diagnosis of Lesions of the Kidney (Lantern Demonstration).
Ira H. Lockwood, Arthur B. Smith and John W. Walker, Kansas City, Mo.
Discussion to be opened by H. Dabney Kerr, Iowa City.

Cholangiography in Stone, Stricture and Surgical Injury of Biliary Ducts (Lantern Demonstration).
C. Robert Hughes, John R. Hannan and Bert E. Mulvey, Cleveland.
Discussion to be opened by Thomas E. Jones, Cleveland.

Thursday, June 12—2 p. m.

Business Session

Election of Officers

Roentgen Appearance of the Chest in Some Diseases Affecting the Peripheral Vascular System of the Lung (Lantern Demonstration).
Robert P. Barden and David A. Cooper, Philadelphia.
Discussion to be opened by Francis M. Rackemann, Boston.

Roentgen Diagnosis of Myocardial Infarction (Lantern Demonstration).
L. Henry Garland, San Francisco, and S. F. Thomas, Palo Alto, Calif.
Discussion to be opened by Philip J. Hodes, Philadelphia.

Pulmonary and Superior Caval Angiography in Relation to Pulmonary and Mediastinal Lesions (Lantern Demonstration).
Marcy L. Sussman and Harold Neuhof, New York.
Discussion to be opened by Evarts A. Graham, St. Louis.

Laminography as an Aid in the Diagnosis of Certain Nontuberculous Lesions in the Chest (Lantern Demonstration).
Eldwin R. Witwer, Detroit, and H. L. Hiebert, Topeka, Kan.
Discussion to be opened by Wendell G. Scott, St. Louis.

Clinical and Roentgen Studies of Radiculitis Simulating Coronary Disease (Lantern Demonstration).
Max Ritvo and David Davis, Boston.
Discussion to be opened by Albert Oppenheimer, Laconia, N. H.

Roentgenographic Examination of Breast Cancer.
J. Gershon-Cohen and Phillip J. Hodes, Philadelphia.
Discussion to be opened by W. Walter Wasson, Denver.

Friday, June 13—2 p. m.

Late Results of Radium Therapy for Carcinoma of the Uterine Cervix (Lantern Demonstration).
Harry H. Bowing and Robert E. Fricke, Rochester, Minn.
Discussion to be opened by Leda June Stacy, White Plains, N. Y.

The Role of Transvaginal Roentgenotherapy in the Treatment of Carcinoma of the Cervix (Lantern Demonstration).
Juan A. del Regato, Columbia, Mo.
Discussion to be opened by James A. Corscaden, New York.

Critical Evaluation of Surgical and Radiation Therapy for Carcinoma of the Cervix (Lantern Demonstration).
Manuel M. Garcia and Leon J. Menville, New Orleans.
Discussion to be opened by Karl H. Martzloff, Portland, Ore.

The Role of Radiation Therapy in Cancer of the Breast (Lantern Demonstration).
Orville N. Meland, William E. Costolow and John W. Budd, Los Angeles.
Discussion to be opened by U. V. Portmann, Cleveland.

The Production of Analgesia by X-Radiation.
Frederick W. O'Brien, Boston.
Discussion to be opened by Hugh F. Hare, Boston.

X-Rays in the Prevention and Treatment of Infections (Lantern Demonstration).
James F. Kelly, D. Arnold Dowell and John E. Downing, Omaha.
Discussion to be opened by John S. Bouslog, Denver.

Roentgenologic Treatment of Lymph Nodes and Spleen in Brill-Symmers Disease. Sidney Rubenfeld, New York.
Discussion to be opened by Samuel E. Cohen, Elmira, N. Y.

SECTION ON ANESTHESIOLOGY

MEETS IN ROOM 20, CONVENTION HALL

OFFICERS OF SECTION

Chairman—Charles F. McCuskey, Los Angeles.
Vice Chairman—Harry Boyd Stewart, Tulsa, Okla.
Secretary—John S. Lundy, Rochester, Minn.
Executive Committee—Paul M. Wood, New York; Ansel M. Caine, New Orleans; Charles F. McCuskey, Los Angeles.

Wednesday, June 11—9 a. m.

Business Meeting for Presenting Resolutions.

Balanced Anesthesia for Thoracoplasty.
Clarence L. Hebert, Washington, D. C.
Discussion to be opened by Robert Richard Jones, Battle Creek, Mich., and Robert B. Orr, St. Albans, N. Y.

Chloroform (Lantern Demonstration).
Ralph M. Waters, Madison, Wis.
Discussion to be opened by Paul M. Wood, New York, and Irving W. Potter, Buffalo.

Anesthesia for Abdominal Surgery (Lantern Demonstration).
Edward B. Tuohy, Rochester, Minn.
Discussion to be opened by Frederico Volbrechthausen, Mexico City, Mexico, and Harry J. Shields, Toronto, Canada.

Controlled Hypotension by Arterial Bleeding During Operation and Anesthesia (Lantern Demonstration).
Donald E Hale, Cleveland.
Discussion to be opened by Perry P. Volpitto, Augusta, Ga., and W. James Gardner, Cleveland.

Effect of Procaine on Liver Function: An Experimental and Clinical Study (Lantern Demonstration).
J. J. Jacoby, J. M. Coon and H. M. Livingstone, Chicago.
Discussion to be opened by Robert D. Dripps Jr., Philadelphia, and John Adriani, New Orleans.

Thursday, June 12—9 a. m.

Election of Officers

Chairman's Address: The Present Status of the Anesthesiology Specialist or Specialty.
Charles F. McCuskey, Los Angeles

Pathology and Anesthesiology. Frank W. Hartman, Detroit.
Discussion to be opened by Wesley Bourne, Montreal, Canada, and Virgil H. Moon, Philadelphia.

Address of Invited Foreign Guest: Anesthesia for Operations Within the Vertebral Canal.
A. R. Hunter, Manchester, England.

Centennial Address: One Hundred Years of Anesthesia (Lantern Demonstration). John S. Lundy, Rochester, Minn.

Anesthesia in Pediatric Patients.
Charles H. Robson, Toronto, Canada.
Discussion to be opened by Curtiss B. Hickcox, Philadelphia, and Lloyd H. Mousel, Washington, D. C.

Friday, June 13—9 a. m.

A Comparison of the Analgesic Effects in Human Subjects of 6-Dimethyl Amino-4, 4-Diphenyl-3-Heptonone (An-148), Morphine and Meperidine (Demerol), and the Relative Efficiency of An-148 for Preoperative and Postoperative Use. Eunice Christensen and E. G. Gross, Iowa City.
Discussion to be opened by Leo V. Hand, Boston, and Stuart C. Cullen, Iowa City.

Anesthesia Study Commission: Findings of Eleven Years' Activity.
Henry S. Ruth, Haverford, Pa., and Frederick P. Haugen and D. Dwight Grove, Philadelphia.
Discussion to be opened by R. J. Whitacre, East Cleveland, Ohio, and Floyd T. Romberger, Lafayette, Ind.

Cardiac Arrest.
Edwin R. Ruzicka and Morris J. Nicholson, Boston.
Discussion to be opened by John B. Flick, Philadelphia, and Ralph M. Tovell, Hartford, Conn.

Use of Differential Spinal Block in the Investigation of Intractable Pain Following Trauma to the Lower Extremity (Lantern Demonstration).
Julia G. Arrowood and Stanley J. Sarnoff, Boston.
Discussion to be opened by Meyer Saklad, Providence, R. I., and Joe Baird, Minneapolis.

Anesthesia in the Aged (Lantern Demonstration).
John B. Dillon, Los Angeles.
Discussion to be opened by Ansel M. Caine, New Orleans, and Mary Karp, Chicago.

SECTION ON GENERAL PRACTICE OF MEDICINE

MEETS IN CAMBRIDGE HALL, CLARIDGE HOTEL

OFFICERS OF SECTION

Chairman—Paul A. Davis, Akron, Ohio.
Vice Chairman—E. A. Royston, Los Angeles.
Secretary—W. B. Harm, Detroit.
Executive Committee—Wingate M. Johnson, Winston-Salem, N. C.; *Paul A. Davis, Akron, Ohio.*

Wednesday, June 11—9 a. m.

Chairman's Address. Paul A. Davis, Akron, Ohio.

Address of Invited Foreign Guest: Nutrition and Endocrinology, with Special Reference to Nutrition Among the Indians of Mexico.
Francisco deP. Miranda, Mexico City, Mexico.

Centennial Address: What Should the General Practitioner Know About This New Psychosomatic Medicine?
Walter C. Alvarez, Rochester, Minn.

The Significance of Hypergenitalism Occurring Before or at the Time of Puberty (Lantern Demonstration).
Lewis M. Hurxthal, Boston.

The Use of Fluorine in Pediatrics (Lantern Demonstration).
Nils P. Larsen, Honolulu, Hawaii.

Thursday, June 12—9 a. m.

Election of Officers

The General Practitioner as an Adjunct to the Industrial Surgeon. F. E. Poole, Glendale, Calif.

Common Misconceptions in Regard to Dermatology (Lantern Demonstration). Marion B. Sulzberger, New York.

The Management of Hypertension and Its Chief Complications (Lantern Demonstration).
Francis D. Murphy, Milwaukee.
Discussion to be opened by N. C. Gilbert, Chicago.

Nasal Stuffiness (Lantern Demonstration).
J. Lewis Dill, Detroit.

The Traumatic Abdomen (Lantern Demonstration).
Arthur R. Metz and Raymond Householder, Chicago, and Gerrit Dangremand, Lake Bluff, Ill.
Discussion to be opened by Grover C. Penberthy, Detroit.

Reducing Mortality in Gastric Carcinoma (Lantern Demonstration). Gilson Colby Engel, Philadelphia.
Discussion to be opened by T. Grier Miller, Philadelphia.

Friday, June 13—9 a. m.

Further Observations on *Dehydration Treatment in Poliomyelitis*, with Some New Concepts in the Pathologic Physiology of the Disease. T. E. Robinson, Salt Lake City.

The Treatment of Chronic Auricular Fibrillation with Quinidine Sulfate (*Lantern Demonstration*).
Robert L. McMillan and Charles R. Welfare, Winston-Salem, N. C.
Discussion to be opened by Roy W. Scott, Cleveland.

Psychotherapy in Everyday Practice.
Edward Weiss, Philadelphia.
Discussion to be opened by Carl A. L. Binger, New York.

Hints in General Surgery (Lantern Demonstration).
R. B. Robins, Camden, Ark.

Headache. Stuyvesant Butler, Chicago.

Clinical Value of Globin Insulin.
Wallace M. Yater, Washington, D. C.

SECTION ON MISCELLANEOUS TOPICS

MEETS IN CAMBRIDGE HALL, CLARIDGE HOTEL

Session on History of Medicine

OFFICERS OF SESSION

Chairman—John F. Fulton, New Haven, Conn.
Secretary—Howard Dittrick, Cleveland.

Wednesday, June 11—2 p. m.

HISTORY OF AMERICAN MEDICINE

In the Old Dominion. M. P. Rucker, Richmond, Va.

In the Massachusetts Bay Colony (Lantern Demonstration).
H. R. Viets, Boston.

In Philadelphia. R. H. Shryock, Philadelphia.

In Kentucky and the Mississippi Valley.
E. F. Horine, Louisville, Ky.

Intermission

Address of Invited Foreign Guest: Spread of the Public Health *Movement, 1847-1947.*
E. Ashworth Underwood, London, England.

HISTORY OF MILITARY MEDICINE

Public Health Service. R. E. Dyer, Bethesda, Md.
United States Navy. L. H. Roddis, Washington, D. C.
United States Army. H. W. Jones, Washington, D. C.

Session on Physical Medicine

OFFICERS OF SESSION

Chairman—Frank H. Krusen, Rochester, Minn.
Secretary—George M. Piersol, Philadelphia.

Thursday, June 12—2 p. m.

Address of Invited Foreign Guest: The Relationship of Physical Medicine to Industrial Medicine (Lantern Demonstration).
D. Y. Solandt, Toronto, Canada.

Rehabilitation of Paraplegics.
Earl C. Elkins, Rochester, Minn.

Psychiatric Aspects of Physical Medicine (Lantern Demonstration). Arthur L. Watkins and Jacob Ellis Finesinger, Boston.

Fundamentals of Physical Medicine of Interest to the General Practitioner. Steven M. Horvath, Philadelphia.

Intermission

PANEL DISCUSSION ON PHYSICAL MEDICINE IN GENERAL PRACTICE

Frank H. Krusen, *Rochester, Minn., Moderator*

Physical Treatment of Arthritis.
Walter M. Solomon, Cleveland.

Physical Medicine in the Treatment of the Aged.
Walter S. McClellan, Saratoga Springs, N. Y.

Physical Medicine and Backache. Frank R. Ober, Boston.

Physical Treatment of Common Dermatologic Conditions (Lantern Demonstration).
Anthony C. Cipollaro, New York.

Physical Medicine in the Management of Fractures (Lantern Demonstration). Miland E. Knapp, Minneapolis.

Session on Allergy

OFFICERS OF SESSION

Chairman—Harry L. Huber, Chicago.
Secretary—Richard Kern, Philadelphia.

Friday, June 13—2 p. m.

Allergy in the Perspective of General Medical Practice (Lantern Demonstration). Harry L. Alexander, St. Louis.
Discussion to be opened by Stearns S. Bullen, Rochester, N. Y.

The Newer Concept of Allergy to Drugs and Bacteria.
Francis C. Lowell, Boston.
Discussion to be opened by M. G. Bohrod, Rochester, N. Y.

The Practical Aspects of Allergic Rhinitis (Lantern Demonstration). Leo H. Criep, Pittsburgh.
Discussion to be opened by Theodore L. Squier, Milwaukee.

Cutaneous Allergy in Pediatric Practice (Lantern Demonstration). Jerome Glaser, Rochester, N. Y.
Discussion to be opened by Albert V. Stoesser, Minneapolis.

The Newer Drugs in the Treatment of Allergic Diseases.
Samuel M. Feinberg, Chicago.
Discussion to be opened by Leon Unger, Chicago.

PANEL DISCUSSION ON THE TREATMENT OF ASTHMA

J. Harvey Black, Dallas, Texas, Moderator.
Charles H. Eyerman, St. Louis (Lantern Demonstration).
Louis Tuft, Philadelphia.
George Piness, Los Angeles.
Discussion to be summarized by Robert A. Cooke, New York.

THE SCIENTIFIC EXHIBIT

The Scientific Exhibit will be located on the main floor of the Atlantic City Auditorium, with entrances adjacent to the general registration desks.

In addition to the seventeen groups of exhibits sponsored by the sections of the Scientific Assembly there will be four special exhibits subsidized by the Board of Trustees. Question and answer conferences on heart disease and on diabetes will be conducted in conjunction with exhibits on those subjects, and three motion picture theaters will show films continuously throughout the week. While a considerable amount of historical material will be shown, the main emphasis of the Scientific Exhibit will be placed on the latest developments in medicine.

Admission to the Scientific Exhibit will be limited to persons wearing the Fellowship badge or other official badge of the Convention. The public will not be admitted to the Scientific Exhibit.

SPECIAL EXHIBITS

The Committee on Scientific Exhibit is sponsoring four special exhibits—cardiovascular diseases, fractures, fresh pathologic material and physical medicine.

Special Exhibit on Cardiovascular Diseases

The Special Exhibit on Cardiovascular Diseases is presented under the auspices of a special committee of which Paul Dudley White, Boston, is chairman, assisted by a large group of physicians. Following are the subjects which will be shown, together with a brief description of each and the names of the demonstrators:

Paul Dudley White and Fred Alexander, Massachusetts General Hospital, Boston:

The Range of the Normal Heart: The range of the normal human cardiovascular characteristics is illustrated by several charts and diagrams constructed for age, body build (height, weight and somatotype) and physiologic activity.

Robert E. Gross, Lewis Dexter, Merrill C. Sosman and C. Sidney Burwell, Children's Hospital, Boston:

Congenital Cardiovascular Disease, Noncyanotic: This exhibit illustrates the physiologic and clinical findings in congenital heart disease of the noncyanotic type, particularly patency of the ductus arteriosus and coarctation of the aorta, and their surgical correction.

Helen B. Taussig, Alfred Blalock and R. N. Paul, Johns Hopkins Hospital, Baltimore:

Congenital Cardiovascular Disease, Cyanotic: Congenital cardiovascular disease of the cyanotic type and its surgical correction are illustrated by diagrams, roentgenograms, electrocardiograms and patients themselves, with particular reference to the tetralogy of Fallot.

T. Duckett Jones, Boston; Edward F. Bland, Brookline, and David D. Rutstein, Albany, N. Y.:

Rheumatic Fever and Rheumatic Heart Disease: The vital importance of the development of community programs for the study and control of rheumatic fever and rheumatic heart disease is illustrated in this exhibit.

Thomas H. Hunter and Richard B. Duane Jr., New York:

Subacute Bacterial Endocarditis: This exhibit illustrates the remarkable progress during the last few years in the treatment of subacute bacterial endocarditis by chemotherapy, particularly by the use of penicillin. The diagnosis and prophylaxis of the disease are also emphasized.

Mandel E. Cohen, Neurological Unit, Boston City Hospital, Boston:

Neurocirculatory Asthenia: The clinical findings of neurocirculatory asthenia, anxiety neurosis or effort syndrome are summarized by the use of charts showing the high familial incidence, abnormalities in breathing and in blood lactate during work, reaction to painful stimuli at low levels and abnormal psychologic tests.

Herrman L. Blumgart, Monroe J. Schlesinger and P. M. Zoll, Beth Israel Hospital, Boston:

Coronary Heart Disease: Variations in the coronary arterial pattern in health and disease are illustrated by statistical charts, tables and colored and labeled roentgenograms. Coronary venous injections are shown also.

William C. Bridges, Reginald H. Smithwick, Lewis Dexter, Dera Kinsey and John R. Graham, Boston:

Hypertension and Hypertensive Heart Disease: An analysis of hypertension, its effects on the heart and its treatment by various measures, in particular sympathectomy, are illustrated in this exhibit.

Conger Williams, Massachusetts General Hospital, Boston:

Electrocardiography: In this exhibit emphasis is placed on the newer technics of electrocardiography and their results, in particular the unipolar and precordial leads and their application to important changes in the myocardium.

Gordon S. Myers, Massachusetts General Hospital, Boston:

Cardiovascular Roentgenology: The importance of cardiovascular roentgenology is illustrated by examples showing its value in studies of the heart, particularly of the auricles and of the great vessels. Special methods of study are included; namely diodrast injection, kymography and cardiac catheterization.

David Littmann, Veterans Hospital, West Roxbury, Mass.:

Rare Heart Disease: To remind the medical profession of rare but important kinds of cardiovascular disease, this exhibit has been prepared with illustrations of seventeen types.

D. C. Elkin and Frederick W. Cooper Jr., Emory University, Atlanta, Ga.:

Vascular Surgery: The physiologic effects of arteriovenous fistulas and other vascular injuries on the circulation are presented and the results of surgical therapy shown.

Arthur C. DeGraff and Robert C. Batterman, New York University, New York:

Treatment of Myocardial Failure and Coronary Artery Insufficiency: This exhibit presents various therapeutic procedures in the treatment of myocardial failure and coronary artery insufficiency, emphasizing in particular the use of digitalis, diuretics and dietary regimens.

Robert R. Linton, Gordon A. Donaldson, George Emerson, Kenneth Evelyn, Richard Hamlin, Irad Hardy, H. E. Kennard, F. A. Simeone, Richard Thompson, Howard

Ulfelder, Richard H. Wallace, Richard Warren and **Claude E. Welch**, Massachusetts General Hospital, Boston:

Diseases of Arteries and Veins: Photographs and charts are presented in this exhibit to describe and illustrate the chief diseases that involve peripheral arteries and veins.

Paul Dudley White, Massachusetts General Hospital, Boston:

Historic Books: A collection of historic volumes which have been milestones in the progress of our knowledge of the heart and circulation in health and disease is demonstrated along with charts showing the evolution of our knowledge in this field.

George E. Burch and **Thorpe Ray**, New Orleans:

Cardiovascular Syphilis: The most important features of cardiovascular syphilis for present day information are illustrated in this exhibit.

Howard B. Sprague, Boston, and **H. M. Marvin**, New Haven, Conn.:

American Heart Association: The exhibit graphically presents the relative importance of diseases of the heart and circulation as well as the need for and the services rendered by local heart associations throughout the country.

Special Exhibit on Fractures

The Special Exhibit on Fractures is presented for the sixteenth time under the auspices of the following committee:

Kellogg Speed, Chicago, chairman.
Frank D. Dickson, Kansas City, Mo.
Gordon M. Morrison, Boston.

The exhibit will be accompanied by continuous demonstrations throughout the week on the following subjects:

Compression Fracture of the Spine.
Fracture of the Carpal Navicular.
Fracture of the Shaft of the Femur.
Fractures into the Knee Joint.
Fracture of the Lower End of the Radius.

A pamphlet giving the essential features of the exhibit will be distributed.

The following orthopedic surgeons will assist the committee with the demonstrations:

[illegible] ine.
C. Fred Ferciot, Lincoln, Neb.
Alfred E. Gallant, Los Angeles.
Nicholas J. Giannestras, Cincinnati.
G. Edmund Haggart, Boston.
Frank M. Hand, Washington, D. C.
J. Whitfield Larrabee, Hartford, Conn.
Henry Milch, New York.
John J. Milroy, Waukegan, Ill.
Gordon M. Morrison, Boston.
Frank G. Murphy, Chicago.
John R. Norcross, Chicago.
John W. O'Meara, Worcester, Mass.
Col. Leonard T. Peterson, Washington, D. C.
Thomas B. Quigley, Boston.
H. E. Reading, Paterson, N. J.
Sheppard [illegible]
Carlo S.
Russell F
Samuel Turek, Chicago.
Theodore H. Vinke, Cincinnati.
Herbert W. Virgin, Miami, Fla.

Special Exhibit on Fresh Pathologic Material

The Special Exhibit on Fresh Pathologic Material is presented with the cooperation of the Section on Pathology and Physiology under the auspices of the following committee:

Frank W. Konzelmann, Atlantic City Hospital, Atlantic City, N. J., chairman.

Jefferson H. Clark, Philadelphia General Hospital, Philadelphia.

Edwin S. Gault, Temple University Medical School, Philadelphia.

Peter A. Herbut, Jefferson Medical College, Philadelphia.

An advisory committee has been appointed to assist the general committee, and includes the following members:

Helen Engleby, Philadelphia.
Alvin G. Foord, Pasadena, Calif.
Frank W. Hartman, Detroit.
Edward B. Krumbhaar, Philadelphia.
Harrison S. Martland, Newark, N. J.
Virgil H. Moon, Philadelphia.
J. J. Moore, Chicago.
Robert A. Moore, St. Louis.

Continuous demonstrations will be carried on throughout the week with the aid of the following pathologists:

Ernest E. Aegerter, Philadelphia.
William P. Belk, Wynnewood, Pa.
Theodore J. Curphey, Hempstead, N. Y.
William Ehrich, Philadelphia.
H. Russell Fisher, Los Angeles.
William W. Hershon, Atlantic City, N. J.
Morton McCutcheon, Philadelphia.
Carlos A. Pons, Asbury Park, N. J.
Helen E. Riggs, Philadelphia.
Asher Yaguda, Newark, N. J.

Special Exhibit on Physical Medicine

The Special Exhibit on Physical Medicine includes Physical Therapy, Occupational Therapy and Rehabilitation. It is presented for the second time under the auspices of the following committee:

Frank H. Krusen, Rochester, Minn., chairman.
Winifred Overholser, Washington, D. C.
Howard A. Rusk, New York.

The subjects covered in the exhibit, with the demonstrators in charge, are as follows:

Kurt Lion, Massachusetts Institute of Technology, Cambridge, Mass.:

Technology and Physical Medicine: This exhibit will deal with the fundamentals of biophysics and instrumentation as related to practice of and research in physical medicine.

Khalil G. Wakin, Mayo Foundation, University of Minnesota, Rochester, Minn.:

Experimental Research in Physical Medicine: This exhibit will present recent developments in experimental research concerning high frequency radiation (microwaves) for heating of living tissues and also studies on the effects of physically induced fever on flow of blood.

Frances Hellebrandt, Baruch Center on Physical Medicine, Medical College of Virginia, Richmond:

Clinical Research in Physical Medicine; Disability Evaluation: This exhibt will demonstrate methods of clinical research in physical medicine and elucidate particularly the employment of ergographs and other measuring devices in the evaluation of disabilities commonly encountered in the practice of physical medicine.

Lieut. Col. Benjamin A. Strickland Jr., Physical Medicine Consultants Division, Office of the Surgeon General, War Department, Washington, D. C.:

Dynamic Physical Reconditioning: This exhibit will demonstrate the methods developed in army hospitals for reconditioning convalescent and disabled persons.

Donald Covalt, Division of Rehabilitation and Physical Medicine, Department of Medicine and Surgery, Veterans Administration, Washington, D. C.:

Physical Rehabilitation for Hemiplegia: This exhibit will demonstrate the employment of physical therapy, occupational therapy and physical rehabilitation in the management of persons having hemiplegia.

Robert L. Bennett, Warm Springs Foundation, Warm Springs, Ga.:

Physical Rehabilitation for Poliomyelitis: This exhibit will describe the use of physical therapy, occupational therapy and physical rehabilitation for persons having poliomyelitis.

Winthrop M. Phelps, Children's Rehabilitation Institute, Baltimore:

Physical Rehabilitation for Cerebral Palsy: This exhibit will present the methods of employing various phases of physical medicine for rehabilitation of persons having cerebral palsy.

Howard F. Polley, Mayo Foundation, University of Minnesota, Rochester, Minn.:

Physical Rehabilitation for Arthritis: This exhibit will deal with the employment of physical procedures for rehabilitation of persons having arthritis.

Henry H. Kessler, New Jersey Rehabilitation Clinic, Newark, N. J.:

Physical Rehabilitation of Amputees: This exhibit will present methods of rehabilitating persons who have major amputations of upper or lower extremities.

A pamphlet giving the essential features of the exhibit will be distributed.

The following demonstrators will assist in the presentation of the exhibit:

Maxwell R. Berry, Atlanta, Ga.
Ruth Brunyate, Baltimore.
Howard A. Carter, Chicago.
Anthony C. Cipollaro, New York.
George G. Deaver, New York.
Ellen Neal Duvall, Richmond, Va.
Mildred Elson, New York.
Harry S. Etter, U. S. Navy.
Salman Faik, Rochester, Minn.
Sara Jane Houtz, Richmond, Va.
Grace Keefe, New York.
LeMoyne C. Kelly, Waterbury, Conn.
Harry Kessler, Bronx, New York.
Robert A. Knight, Baltimore.
A. B. C. Knudson, Washington, D. C.
Peter LaBarba, Hasbrouck Heights, N. J.
Hugo Logemann, Boston.
Leslie London, Hasbrouck Heights, N. J.
Duane D. Love, Sandusky, Ohio.
Margaret Lee Moore, Richmond.
J. M. Moore, Baltimore.
Cecil W. Morgan, Washington, D. C.
Campbell McCullough, Baltimore.
Arthur M. Pruce, Atlanta, Ga.
William D. Robinson, Ann Arbor, Mich.
A. I. Robbins, Baltimore.
Herman L. Rudolph, Reading, Pa.
Roy Schubert, Hasbrouck Heights, N. J.
Marion G. Smith, Chicago.
Richard T. Smith, Philadelphia.
Robertine St. James, Baltimore.
George D. Wilson, Asheville, N. C.
Charles S. Wise, Boston.
Ralph E. Worden, Rochester, Minn.
Catherine Worthingham, New York.
Walter J. Zeiter, Cleveland.

QUESTION AND ANSWER CONFERENCES

Two question and answer conferences will be conducted throughout the week with the cooperation of the Section on Internal Medicine.

Cardiovascular Diseases

The question and answer conference on cardiovascular diseases will be conducted by the American Heart Association in an area adjacent to the Special Exhibit on Cardiovascular Diseases. The chairman of the conference is E. V. Allen, Rochester, Minn. Following is the tentative schedule:

Monday, June 9

9 to 11 a. m. *The Use of Anticoagulants in Cardiovascular Diseases.* N. W. Barker, Rochester, Minn., Samuel Levine, Boston, and E. Sterling Nichol, Miami, Fla.

2 to 4 p. m. *The Diagnosis of Congenital Heart Disease.* Herrman L. Blumgart, Boston, and Helen B. Taussig, Baltimore.

Tuesday, June 10

9 to 11 a. m. *The Peripheral Arterial Diseases.* Wallace M. Yater, Washington, D. C.; Irving S. Wright, New York, and N. W. Barker, Rochester, Minn.

2 to 4 p. m. *The Use of Drugs in Heart Diseases.* Arthur C. DeGraff, New York; Harry Gold, New York, and Howard B. Sprague, Boston.

Wednesday, June 11

9 to 11 a. m. *Surgical Treatment for Vascular Diseases.* Norman E. Freeman, San Francisco; Geza de Takats, Chicago, and J. Ross Veal, Washington, D. C.

2 to 4 p. m. *Problems in Electrocardiography.* Charles T. Wolferth, Philadelphia; Franklin Johnson, Ann Arbor, Mich., and George Burch, New Orleans.

Thursday, June 12

9 to 11 a. m. *Hypertension.* Irvin H. Page, Cleveland; M. H. Barker, Rochester, Minn., and J. Q. Griffith, Philadelphia.

2 to 4 p. m. *Rheumatic Fever.* T. Duckett Jones, Boston, and May Wilson, New York.

Friday, June 13

9 to 11 a. m. *Management of the Failing Heart.* Francis C. Wood, Philadelphia; Graham Asher, Kansas City, Mo., and Eugene Stead, Durham, N. C.

Diabetes

The question and answer conference on diabetes will be conducted in a room adjoining the group of exhibits on diabetes by members of the American Diabetic Association, the Diabetes Section of the U. S. Public Health Service and of the George F. Baker Clinic, New England Deaconess Hospital, Boston. The chairman of the group is Howard F. Root, Boston. A regular schedule will be followed each day.

AMERICAN MEDICAL ASSOCIATION

One Hundred Years of Progress

A group of exhibits from the headquarters office of the American Medical Association depicts the progress which has been made since 1847. The exhibits are arranged in chronological order, according to the date of establishment of the various councils and bureaus.

Organization of the American Medical Association—1847. George F. Lull and members of the Headquarters staff with the cooperation of L. M. Tocantins, College of Physicians, Philadelphia:

American Medical Association, 1847-1947: The exhibit shows interesting details of the early days of the Association, the development through the years and the present organization of more than two thousand component county medical societies, fifty-three constituent state and territorial medical societies and the headquarters organization with its House of Delegates, Board of Trustees, councils, bureaus, committees and publications.

Bureau of Exhibits—1899. Thomas G. Hull and Ralph P. Creer, with the cooperation of Thurman B. Rice, Indiana University Medical School, Indianapolis:

Visual Education: The exhibit presents the beginnings of the Scientific Exhibit in 1899, with the subsequent development of the Bureau of Exhibits and the Committee on Medical Motion Pictures. Information about exhibits is presented both for medical meetings and for public gatherings. Information about motion pictures and how to use them is presented. Pamphlets dealing with these subjects will be available.

Council on Medical Education and Hospitals—1904. Victor Johnson, F. H. Arestad, Frode Jensen and William R. Albus:

Progress of Medical Education and Hospitals: The exhibit displays the progress of medical education and hospitals since the organization of the American Medical Association. There is a life chart of all existing and extinct medical colleges in the United States, showing the years of their existence from 1825 to the present day. Another chart illustrates important dates in the history of the Association's endeavors in the improvement of medical schools and hospitals, commencing with the formation of the Committee on Medical Education at the first session of the American Medical Association. The number of institutions approved by the Council are listed and the medical student register and the hospital registry are illustrated. There is a chart showing the expansion of hospital residencies from 1941 to 1947 and a graph showing the number of medical college and medical school graduates since 1800.

Council on Pharmacy and Chemistry—1905. Austin E. Smith, Walton Van Winkle Jr. and Harold D. Kautz:

Therapeutic Highlights—Past, Present and Future: The exhibit emphasizes the more important advances in medicinal therapeutics that have come within its scope since its establishment in 1905. It includes historic landmarks in therapeutics, illustrations of conditions for which the use of certain prophylactic and therapeutic agents are focused at the present time, and preferred steps in the development of new therapeutic agents in the future. Pamphlets describing these details will be available for distribution.

Chemical Laboratory—1906. Albert E. Sidwell:

Progress in Drug Analysis: The exhibit includes a comparison of the drugs analyzed by the laboratory forty years ago and the drugs analyzed at the present time. There is a display of old books connected with this work. Emphasis is placed on the work now being done by the Laboratory.

Bureau of Investigation—1906. B. O. Halling.

Mechanical Quackery of the Past One Hundred Years: The exhibit consists of about twenty gadgets that have been promoted for healing various physical disorders, including such things as the Perkins tractors, the "magic horse-collars," a goiter necklace, the "gas-pipe" fraud, a radium water jar and "medical shoe plates." The exhibit is intended to show that there are no limits to fantastic fakery or to human gullibility and that there have been as preposterous medicomechanical swindles foisted on the public in recent years as there were a century ago.

BUREAU OF HEALTH EDUCATION—1910. W. W. BAUER and W. W. BOLTON:

Health Education by the Medical Profession: The exhibit sets forth highlights on health education by the medical profession as far as it is channeled through this Bureau, with a recognition that the work of many other departments of the Association contributes also to health education. The exhibit includes material on radio, electrical transcriptions, meetings and lectures, cooperation with other agencies, correspondence with the public, television and physical fitness in relation to health.

LIBRARY—1911. MARJORIE HUTCHINS MOORE:

Dispensing Medical Information: The exhibit will feature the package library and periodical lending services, with sample package libraries. A collection of foreign language periodicals received since the end of the war will be on display. The QUARTERLY CUMULATIVE INDEX MEDICUS will also be exhibited, showing particularly photostatic copies of pages covering the references on penicillin, streptomycin and the sulfonamides.

BUREAU OF LEGAL MEDICINE AND LEGISLATION—1922. J. W. HOLLOWAY JR. and GEORGE E. HALL:

Prevention of Malpractice: A photographic representation of situations which might give rise to malpractice claims. Each photograph has an explanatory and cautionary caption. An accompanying file contains abstracts of actual court cases exemplified by the photographs.

COUNCIL ON PHYSICAL MEDICINE—1925. HOWARD A. CARTER and FREDERIC T. JUNG:

Atomic Energy and the Future of Medicine: Charts illustrating some of the basic principles and describing some of the most interesting transformations. There will be a display of apparatus (Geiger counter, oscilloscope) used in the detection of the presence of radioactive elements that are used as tracers.

COUNCIL ON FOODS AND NUTRITION—1929. JAMES R. WILSON:

Food Acceptance Program: The exhibit illustrates some of the things that the Council on Foods and Nutrition has accomplished in this field and some of the things it hopes to accomplish in the future.

BUREAU OF MEDICAL ECONOMIC RESEARCH—1930. FRANK G. DICKINSON:

Medical Economic Research: The exhibit features charts showing a comparison of professional incomes—dentists, physicians, certified public accountants, consulting engineers and lawyers; the increases in the expectation of life at birth during the past century from 40 years in 1847 to 65 years in 1947, and eight selected items of consumer expenditures in the United States for the latest year available (1942), including payments to physicians and all expenditures for medical care in relation to the other selected items.

COUNCIL ON INDUSTRIAL HEALTH—1937. CARL M. PETERSON and HAROLD H. HENNESSY:

Industrial Health—Past, Present and Future: The exhibit consists of drawings on panels depicting industrial medicine in the Ramazzini era, the present modern era and the Atomic era of the future.

COUNCIL ON MEDICAL SERVICE—1944. GEORGE W. COOLEY and HOWARD O. BROWER:

Medical Service: Exhibit featuring the work of the Council and showing the Council's relationship to the physician, the public and the patient. It includes organization and function charts of the Council, examples of state and county medical society activities, picture display of Ten Point Program and charts, maps and other material on prepayment plans. Pamphlets and copies of exhibit material will be available at the booth.

BUREAU OF INFORMATION—1945. VIRGINIA SHULER:

Distribution of Physicians and Rural Medical Service: A 7 by 5 foot map showing by counties the physician distribution throughout the United States will be presented. Listings of areas which have requested physicians will be available for review. A panel prepared by the Medical Department, U. S. Army, will illustrate the transition of doctors from military to civilian life. Facing this panel the Division of Hospital Facilities, U. S. Public Health Service, has prepared a graphic presentation of the Coordinated Hospital System relating the rural clinic to the nearest hospital and on up the line to the university medical center. This system provides a two-way channel of hospital and medical services. The original paintings of "The Family Doctor" by Norman Rockwell will be shown.

COMMITTEE ON NATIONAL EMERGENCY MEDICAL SERVICE—1946. FRANCES TOFIELD:

Physicians' Problems in a National Emergency: The exhibit presents graphically the part that the American physician will play in safeguarding the health and lives of the civilian population of his community in time of national emergency. The exhibit includes the tabulated returns from questionnaires which were sent to 50,000 discharged medical officers and 5,000 physicians who remained at home during World War II. Tables, charts and statistical summaries of the opinions of approximately 28,400 physicians on the subject of military service and civilian medical care are presented.

SECTION EXHIBITS

Each of the seventeen sections of the Scientific Assembly has arranged a group of exhibits dealing with the various branches of medicine.

Section on Internal Medicine

The representative to the Scientific Exhibit from the Section on Internal Medicine is Thomas C. Garrett, Philadelphia.

M. HERBERT BARKER and RICHARD B. CAPPS, Northwestern University Medical School, Chicago:

Infectious Hepatitis: A series of charts, in color, covering the symptoms, physical findings, laboratory tests and liver function tests, hematology, epidemiology and treatment of infectious hepatitis. A comparison of liver function tests made during the course of the disease is illustrated.

GRACE A. GOLDSMITH, Tulane University School of Medicine, New Orleans:

Treatment of Macrocytic Anemia with Pteroylglutamic Acid (Folic Acid): The effect of the administration of pteroylglutamic acid on clinical findings, peripheral blood picture and bone marrow in patients with pernicious anemia, sprue and nutritional macrocytic anemia is illustrated by graphs, charts, photographs and roentgenograms of the gastrointestinal tract. Diagnostic criteria of each of these types of anemia are indicated, and the results of therapy over periods as long as eighteen months are included. Slides illustrating changes in the peripheral blood and bone marrow in response to therapy will be available for microscopic study.

O. C. DURHAM, Abbott Laboratories, North Chicago, Ill.:

Technics in Aerobiology as Applied to Allergy: The essential advances in the study of the dispersal of aeroallergens during the past century are presented. Various pieces of recently developed or adapted apparatus are shown, including the standard exposure device adopted in 1944 by the National Pollen Survey Committee of the American Academy of Allergy. Methods of air sampling, the counting of pollens and fungus spores, the interpolation of gravity slide figures and graphic presentation of statistics are illustrated and demonstrated.

LEON UNGER, HERMAN A. LEVY, ALBERT H. UNGER and ISABELLE BRANDT EISELE, Northwestern University Medical School and Wesley Memorial Hospital, Chicago:

Asthma Through the Ages: Murals depicting scenes which illustrate the highlights in the history of the study of asthma are exhibited. One scene is from the ancient and medieval period to 1500 A. D.; one from the preindustrial period (1500-1900 A. D.), and two from the modern and contemporary periods (since 1900 A. D.). Portraits of twenty men who were pioneers in the study of asthma, telling contributions of each, are also shown. The exhibit demonstrates present views regarding etiology, pathology, diagnosis, prevention and treatment of bronchial asthma. The education of the physician and the public is stressed. The display includes a preserved emphysematous lung, and chest x-ray films of asthma and its complications. Kodachrome transparencies of chest abnormalities, positive skin reactions, eosinophilia in blood, sputum and nasal smears, and several causative factors, e. g. molds and weeds, are shown. The technic of scratch and intradermal tests will be demonstrated on patients. Reprints and information leaflets which deal with etiology, diagnosis, differential diagnosis, treatment and results of treatment will be distributed.

Edward Matzger and W. W. Washburn, Southern Pacific Hospital, San Francisco, and LeRoy Abrams, Leland Stanford Jr. University, Palo Alto, Calif.:

Allergy: An evaluation of twenty years of the allergy service of the Southern Pacific Railroad Hospital Department is presented, with study of patients referred for their allergic complaints. The study includes the industrial problems involved, outlining the importance to safe train operation. The methods of pollen surveys and the maps and charts of chronology of pollination are shown. The methods employed and the technic of individual allergic study and the simplified, effective antigen therapy are summarized.

Charles A. Doan, E. Von Haam and B. K. Wiseman, Ohio State University College of Medicine, Columbus:

Hypersplenism: Diagnosis, Pathology, Therapy: The clinical and hematologic criteria for recognizing the various hypersplenic states will be demonstrated. The differential splenic histopathology will be illustrated in photomicrographs, with special reference to "primary" versus "secondary" splenic involvement. Evidence for the humoral and/or phagocytic mechanisms in these splenic-bone marrow syndromes will be presented. The results of therapeutic splenectomy, as observed in this clinic during the past seventeen years, will be reviewed.

William S. Reveno, Harper Hospital and Wayne University College of Medicine, Detroit:

Antithyroid Therapy: A comparison of the therapeutic action of iodine, thiouracil and propyl thiouracil, alone and combined, based on clinical experience, is presented.

J. Russell Twiss and R. Franklin Carter, New York Post-Graduate Hospital, New York:

Should Your Patient's Gallbladder Be Removed? Notwithstanding the prevalence of disorders of the gallbladder, there is still no general acceptance of definite indications and contraindications for operation. The exhibit reflects fifteen years' experience of a combined medical and surgical biliary tract clinic. The results of diagnostic methods which have proved of value are presented, stressing the differential diagnosis between functional disorders and organic disease. Further consideration is given to an evaluation of the role played by factors such as infection, obstruction and stone formation. Conclusions as to the indications for medical or surgical treatment are based on diagnostic, operative and follow-up studies in approximately 500 cases.

E. P. McCullagh, R. S. Dinsmore, George Crile Jr. and Robert W. Schneider, Cleveland Clinic, Cleveland:

Indications for Medical or Surgical Treatment of Hyperthyroidism: Transparencies of patients illustrate examples of various types of hyperthyroidism, accompanied with data regarding treatment recommended and clinical progress both in the cases shown as well as cumulative data relating to the value and limitations of propyl thiouracil.

Otto Steinbrocker, Norman Spitzer and H. Harold Friedman, Bellevue Hospital, 4th Medical Division, New York University, New York:

The Shoulder-Hand Syndrome: A pictorial description of this syndrome is presented, with illustrations of clinical features, progress and long-range results by black and white and colored transparencies of the patients; x-ray films, oscillometric graphs, venograms and other data are shown.

Michael A. Rubinstein, Montefiore Hospital, New York:

Iliac Crest versus Sternal Bone Marrow Puncture; Diagnostic Importance: Bone marrow studies were performed simultaneously in iliac crest and sternal aspirations in over 200 cases of various hematologic disorders and different cases of cancer. A modified technic of iliac puncture is shown and its advantages are indicated. The comparative value of iliac crest and sternal marrow studies in different affections is reviewed. The iliac crest aspiration has proved to be much more informative than the sternal aspiration in early diagnosis of multiple myeloma and in detection of metastatic lesions in cancer; neoplastic cells were much more frequently recovered from iliac than from sternal aspirations. In some cases the first indication of cancer was furnished by iliac aspiration before the appearance of any clinical or x-ray evidence. Illustrative examples of these findings are presented.

Smith Freeman and C. H. Slocumb, Mayo Clinic, Rochester, Minn.:

Vitamin D Poisoning (Hypervitaminosis D) in Human Subjects: The exhibit includes histories, symptoms, clinical, roentgenologic and chemical findings in patients with vitamin D poisoning. The contributing factors, early recognition, course, complications and management are presented.

John D. Currence and F. LeVerne Eby, Post-Graduate Hospital and Medical School, Columbia University, New York:

Osteoarthritis: The exhibit is a presentation of traumatic, senile, postinfectious and menopausal osteoarthritides with etiology, pathology, prognosis and emphasis on therapy.

Hugo A. Freund, Gabriel Steiner and Carl E. Duffy, Harper Hospital and Wayne University College of Medicine, Detroit:

Recent Advances in Studies of Rheumatoid Arthritis: Photographs, history, laboratory and x-ray findings of cases of rheumatoid arthritis are presented. Pathologic findings at necropsy, especially of nerves and muscles, are demonstrated, and other pathologic evidences of rheumatoid arthritis compared with recent findings of nodular perineuritis and generalized polymyositis. The correlation between clinical and pathologic states are shown and biopsied muscle material from a series of cases of rheumatoid arthritis are presented. Results of recent investigations and comparative studies concerning the etiology of rheumatoid arthritis are presented.

Arthur M. Master, Simon Dack, Arthur Grishman, Henry Horn and Leonard E. Field, Mount Sinai Hospital, New York:

Acute Coronary Insufficiency (Without Acute Occlusion): The etiologic factors are those which produce myocardial anoxia, such as effort, operation, anoxemia, acute hemorrhage, severe anemia, shock, pulmonary embolism and tachycardia. The electrocardiogram is chacterized by T wave inversions and ST depressions. Severe coronary insufficiency may result in focal necrosis localized to the papillary muscles and subendocardial layers of the left ventricle. Treatment may be life saving and should be directed to the etiologic factors such as hemorrhage, shock and anoxemia. This disease is quite different from acute coronary occlusion, from which it can be differentiated clinically.

Don Carlos Peete, University of Kansas Hospitals, Kansas City:

Psychosomatic Genesis of Coronary Artery Disease: Historical contributions were made to our present understanding of coronary artery disease by Galen, Heberden, Jenner, John Hunter, Pavlov, Krogh, Einthoven, Cannon and Herrick. Clinical study shows importance of environment and early social history in developing a vasospastic reaction pattern that ultimately leads to sclerosis and complicating thrombosis.

Irving Treiger, Los Angeles:

Correlative Study of Cardiac Diseases: Correlative study of roentgenograms, electrocardiograms and pathologic specimens in frequently encountered heart conditions to emphasize the correlative clinical value of various methods of examination in diagnosis and treatment of cardiovascular diseases.

(This work was done at the University of Illinois College of Medicine and Presbyterian Hospital, Chicago.)

William Dressler, Israel Zion Hospital, Brooklyn, and Hugo Roesler, Temple University Hospital, Philadelphia:

Advances in the Electrocardiographic Diagnosis of Myocardial Infarction: Exhibit showing (1) the role of multiple chest leads in the diagnosis of myocardial infarction; (2) high T waves, an early sign of myocardial infarction; (3) an electrocardiographic pattern of septal infarction which extends from the anterior to the posterior aspect of the heart; (4) reciprocal changes of ST and T in the chest leads from right side and left side positions; (5) the significance of the pattern $T_1 < T_3$ for the diagnosis of myocardial infarction; (6) myocardial infarction associated with bundle branch block; (7) myocardial infarction associated with left ventricle hypertrophy; (8) changes in the electrocardiogram which simulate myocardial infarction but which are caused by pendulous heart, pulmonary emphysema or a large breast; (9) an attempt at evaluation of the electrocardiogram for the prognosis in myocardial infarction; (10) serial electrocardiographic tracings in myocardial infarction.

Henry B. Kirkland, A. M. Lyle and C. E. Kiessling, Prudential Insurance Company, Newark, N. J.:

The Abnormal Thoracic Aorta and Its Prognostic Significance: A correlation of x-ray findings, electrocardiographic changes and the clinical course in individuals with roentgenologic evidence of aortic atheromatosis is shown. The development of intimal calcification is demonstrated. Studies bearing on ultimate prognosis are presented. Emphasis is laid on the importance of correct evaluation of findings, and films illustrating diagnostic pitfalls are shown.

George E. Burch and Paul Reaser, Tulane Medical School, New Orleans:

Radio Elements and Mechanism of Congestive Heart Failure Radiosodium (Na^{24} and Na^{22}): Studies in patients with various degrees of congestive heart failure and control subjects showed a considerable disturbance in sodium excretion in congestive failure. There was a much more prolonged retention of Na^{22} in CHF than in the normal subject. Mercurial diuretics increased the rate of Na^{22} excretion. In congestive heart failure the degree of renal tubular reabsorption of Na is greatly increased over the normal. Other edema states of renal origin tend to show an Na pattern similar to that in congestive heart failure. The physiologic and therapeutic significance of these findings is indicated.

J. Q. Griffith Jr., M. A. Lindauer, R. L. Shanno and E. Roberts, University of Pennsylvania, Philadelphia:

Hyperpituitarism Causing Arterial Hypertension: Diagnosis and Treatment: Illustrations and models are used to demonstrate the bioassay methods for antidiuretic hormone of the posterior lobe of the pituitary and gonadotropic hormone of the anterior lobe. The effect of anterior lobe hormones in producing increased activity of the posterior lobe in susceptible animals is described, and the analogy indicated with human hypertension occurring at the menopause or during pregnancy. Results of therapy are shown (1) by pituitary irradiation, (2) by repeated injections of pitressin tannate in oil, probably with the production of an antihormone state, (3) by sex hormone therapy.

David Ayman and Archie D. Goldshine, Beth Israel Hospital, Boston:

Therapeutic Methods in Essential Hypertension: Charts of patients studied in the past ten years show carefully followed blood pressure levels, both at the clinic and in many cases by home readings under treatment with placebos, sedatives, thiocyanates, low sodium diet, rice-fruit-sugar diet, vitamin K, testosterone and sympathectomy.

Lieut. L. Martin Griffin Jr., M. C., and Lieut. Fred I. Gilbert, M. C., Stanford University School of Medicine and Veterans Administration, Palo Alto, Calif.:

Glomerular Nephritis—Recognition and Treatment: The exhibit presents the dynamic concept of glomerular nephritis with diagrams illustrating the progression of the disease through the initial, latent, degenerative and terminal stages. To accomplish this, charts and photographs correlating the clinical picture of glomerular nephritis with pathologic changes of the blood, urine and kidneys are used. This includes photomicrographs and drawings of kidney sections and urinary sediment during various stages of the disease. Simple clinical laboratory methods for determinig the activity and progression of the renal lesion are demonstrated. Treatment and management of the different stages are outlined in terms of renal pathologic change.

T. J. Dry, J. E. Edwards, R. L. Parker, H. B. Burchell and H. M. Rogers, Mayo Clinic, Rochester, Minn.:

Congenital Anomalies of the Heart and Great Vessels; Clinicopathologic Correlation: Representative examples of major anomalies of the heart and great vessels are presented by models showing external anatomy as well as internal structure of the various types encountered; drawings explaining the abnormal circulation; roentgenograms and electrocardiograms of the various types; pertinent clinical features observed in each type; significant embryologic considerations contributing to these congenital anomalies.

Edward M. Kent, George J. Kastlin and Theron B. Childs, Pittsburgh:

Solitary Pulmonary Abscess Occurring with Bronchogenic Carcinoma: Translites of roentgenograms and operative specimens are presented to illustrate the location and characteristics of solitary pulmonary abscess due to bronchogenic carcinoma, resulting from (1) bronchial obstruction or (2) central necrosis, infection and excavation within the carcinoma. These lesions simulate closely the more commonly recognized solitary pyogenic abscess of other origin. Recognition of these lesions as a complication of bronchogenic carcinoma is necessary so that treatment of the primary tumor is not delayed. The clinical importance of history, symptom complex, bronchoscopy and biopsy is presented. The pulmonary lesions usually associated with bronchogenic carcinoma are demonstrated such as pulmonary atelectasis, diffuse pulmonary suppuration and solitary pulmonary mass.

Robert L. McMillan, J. P. Rousseau and J. C. Wiggins, Bowman Gray School of Medicine of Wake Forest College, and North Carolina Baptist Hospital, Winston-Salem, N. C.:

Pulmonary Infarction: The exhibit consists of charts, posters, photographic reproduction of typical roentgenograms, drawings of the pulmonary circulation, heart and lungs, and drawings of the venous circulation from the legs to the vena cava with thrombi and emboli illustrated. A new physical sign is described.

Henry Schwerma and A. C. Ivy, Northwestern Medical School and University of Illinois College of Medicine, Chicago:

Resuscitation from Asphyxia: The results of controlled experiments designed to determine the best method for resuscitation from carbon monoxide and obstructive asphyxia are presented. Evidence supporting such statements as the following is presented: The heart is the critical organ in relation to immediate survival and the brain in relation to the occurrence of significant sequelae following resuscitation. The incidence of neurologic sequelae is related to the degree and duration of the anoxia. The percentage of immediate survivals and the incidence of neurologic sequelae is the same whether 100 per cent oxygen or 7 per cent carbogen is used. The important point in treating asphyxia is to oxygenate the blood as quickly as possible in order to revive the failing heart and to stop the deleterious effects of anoxia on the brain cells.

K. J. Henrichsen, Municipal Tuberculosis Sanitarium, Chicago:

Diseases of the Lungs—Differential Diagnosis in Tuberculous and Nontuberculous Conditions Encountered in the Sanitarium:

History and roentgenograms of cases, with pathologic specimens demonstrating diseases of the lungs, tuberculous and nontuberculous, differential diagnosis and treatment.

William Dameshek and S. Estren, J. H. Pratt Diagnostic Hospital, Tufts College Medical School and Boston Dispensary, Boston:

The Spleen and Splenic Syndromes: Spleen-bone marrow relationships are brought out by various types of experiments, including splenectomy and parabiosis and by the clinical and laboratory findings in various pathologic conditions. Splenomegaly is often associated with anemia, leukopenia or thrombocytopenia or with various combinations of these. The bone marrow under such conditions is hyperplastic, suggesting a "block" between the marrow and the circulating blood. The "blocking" organ appears to be the spleen, as judged by the results of splenectomy. Various syndromes of "hypersplenism" may be discriminated. These may be total, with pancytopenia, or selective with anemia, leukopenia or thrombocytopenia. Idiopathic thrombocytopenic purpura, splenic neutropenia, splenic pancytopenia and certain types of hemolytic and nonhemolytic anemia are examples of various types of splenic syndromes. Recognition of these syndromes by careful blood and other examinations is all important, since splenectomy may lead to complete recovery.

Section on Surgery, General and Abdominal

The representative to the Scientific Exhibit from the Section on Surgery, General and Abdominal, is Warren H. Cole, Chicago.

J. Ross Veal, Georgetown University Medical School, Washington, D. C.:

Hyperhidrosis—Surgical Management: Charts, colored photographs, descriptive drawings of the etiology, symptomatology, course and treatment is presented, and the relation of excessive sweating to other vascular conditions is shown.

Thomas A. Shallow, Sherman A. Eger, and Frederick B. Wagner Jr., Jefferson Medical College, Philadelphia:

Modern Concepts of Acute Pancreatitis: All phases of this subject are presented and amply illustrated from a personal series of 50 cases. Special emphasis is placed on methods of early diagnosis and proper management from both medical and surgical points of view.

Lester R. Dragstedt, Paul V. Harper, Edward R. Woodward, E. Bruce Tovee and Augustin Rodolfo, University of Chicago Medical School, Chicago:

Gastric Vagotomy in the Treatment of Peptic Ulcer: Photographs, charts and diagrams illustrate the physiologic basis for gastric vagotomy in the treatment of peptic ulcer. Experimental evidence indicates that pure gastric juice has the capacity to digest all living tissue, including the mucous membrane of the stomach, duodenum and jejunum. A gastric content which approximates the composition of pure gastric juice accumulates in the stomach under conditions in which the alkaline duodenal secretions fail to reach the intestine or when there is an excessive secretion of gastric juice either in response to the ingestion of food or in the empty stomach. The latter situation most often obtains in patients with peptic ulcer and is a major factor in the cause of the disease. An excessive continuous secretion of gastric juice in the stomach of ulcer patients is shown, and this excessive secretion is abolished by section of the vagus nerves to the stomach. Data also are presented from the experimental laboratory indicating the effect of vagus section on the total output of acid from the stomach of experimental animals. The effect of vagotomy on gastric sensation and on other gastrointestinal functions is described.

Keith S. Grimson, G. J. Baylin, H. M. Taylor, F. H. Hesser and R. W. Rundles, Duke Hospital, Durham, N. C.:

Transthoracic Vagotomy for Peptic Ulcer: Transthoracic vagotomy has been performed on 57 patients observed from nine to thirty-six months. The clinical results and the effect on the secretions and the motility of the stomach are presented. The possible role of chemical or nervous mechanisms in the causation of ulcer is considered. Particular emphasis is placed on the complications such as retention and diarrhea that occurred after vagotomy.

I. A. Brunstein, Stuyvesant Polyclinic, New York:

Critical Evaluation of the Trendelenburg Test: Evaluation of the Trendelenburg test based on the anatomic distribution of varicose veins in the lower extremity is made. Criteria for the selection of the proper method of treatment of individual cases of varicosities are presented. An appliance with which to execute the Trendelenburg test in cases with wide distribution of varicose veins is shown.

Donald C. Beaver and William E. Johnston, Woman's Hospital, Detroit:

Tumors of Lateral Aberrant Thyroids: Lateral aberrant thyroid tumors are of sufficient clinical importance and occur frequently enough to warrant a better understanding of their pathogenesis, pathology and clinical behavior. The complete story of these tumors, including historical sketch, embryology, pathogenesis, medical and surgical survey, diagnosis, treatment, pathology, postoperative follow-up and summary, is given, with the presentation of 6 cases. The exhibit is prepared on 5 by 7 inch transparency film.

E. L. MacQuiddy, University of Nebraska College of Medicine, Omaha:

Absorbable Powder Tissue Reactions and Physical Properties: Results obtained with an absorbable powder showing tissue reactions obtained by intraperitoneal and tissue implantation and insufflation are demonstrated. Both short and long term experiments are represented. Allergenic properties are reported. This is a processed starch, studied as a glove, dressing and dusting powder.

Meyer O. Cantor, Grace Hospital, Detroit:

Simplified Intestinal Decompression Tube: Roentgenograms demonstrate that a simplified single lumen intestinal decompression tube is the most efficient instrument to produce intestinal decompression. A life size plaster model with the gastrointestinal tract constructed of glass has been made. In this way it can be demonstrated how gravity is utilized in this type of tube, which was constructed to utilize the physical properties of mercury to the utmost, i. e. weight, lability and cohesive force. To utilize these properties fully a different technic in passing these tubes will be demonstrated.

A. H. Bulbulian, Mayo Clinic, Rochester, Minn.:

Prosthesis of the Face and Hands: Methods, material and equipment used in the reconstruction of the nose and ear, hands and fingers by the prosthetic means. Examples of representative types of such reconstruction in colored transparencies. Steps of the technic from taking the impression up to the preparation of the finished prosthesis will be shown.

W. M. Adams, Memphis, Tenn.:

Free Composite Grafts of the Nipples in Mammary Plasty: The exhibit shows pictures of cases before and after operation as well as pictures and drawings illustrating the procedure.

James Barrett Brown, Louis T. Byars, Frank McDowell and Minot P. Fryer, Washington University School of Medicine, St. Louis:

Repairs in Plastic Surgery by Single Operations: Representative lesions requiring plastic surgery that may be repaired in a single operation are shown and the results of the single operation are recorded. This is to call attention to the fact that not all lesions requiring plastic surgery demand long periods of hospitalization and multiple operations. In many instances this depends on the use of a free graft rather than a flap, or the use of local available tissue rather than a distant flap or a graft. The economic and hospital space saving is an important result.

Nicholas A. Michels, Daniel Baugh Institute of Anatomy, Jefferson Medical College, Philadelphia:

Arterial Variations—Liver, Gallbladder, Stomach, Duodenum Pancreas and Spleen: A demonstration of the variations in the arterial blood supply of supramesocolonic organs as ascertained by dissections of the cadavers at the Daniel Baugh Institute of Anatomy, Jefferson Medical College, is presented. Detailed dissections were made previous to student dissection in 100 bodies for the spleen and in 200 bodies for the other organs. In every instance a drawing was made of the existent arterial variation, no two patterns being the same. Charts with appended explanatory notes and a group of wet specimens show the most striking variations.

George M. Dorrance, J. W. Bransfield, S. Gordon Castigliano and A. J. Donnelly, American Oncologic Hospital, Philadelphia:

Reparative Surgery and Its Place in the Treatment of Malignant Growths: Indications for reparative surgery in the management of malignant neoplastic disease involving the skin of the scalp, face, breast and extremities, mouth and jaw are demonstrated. The influence of radiation therapy on reparative surgery is brought out, and the difference in the management of the cancer case and the traumatic case is emphasized.

William Law Watson and John L. Pool, Memorial Hospital, New York:

Silent Intrathoracic Tumors—Discovery and Management: This material is derived from a relatively large group of asymptomatic patients in whom demonstrable intrathoracic tumors were discovered by chance radiographic examination carried out in the screening of large numbers of healthy young adults. A high percentage of the total number of cases in this series occurred in navy personnel and were discovered during routine radiographic chest examination. Representative cases are demonstrated by (1) preoperative chest x-rays, (2) colored transparencies of the gross operative specimen and (3) photomicrographs in color. The object and purpose of the presentation are to emphasize the need for routine, periodic chest x-ray examination for all young adults.

Herbert Willy Meyer, Tumor Clinic, New York Post-Graduate Medical School and Hospital, New York:

Cancer of the Head and Neck: The lymphatic drainage of lip and tongue cancer is shown, as well as cancers of the head and neck of patients before operation, surgically removed specimens and patients after operation with follow-up. Literature describes the basis of the principles of therapy of cancer of the head and neck as performed at the Tumor Clinic of New York Post-Graduate Hospital.

Leonard B. Goldman, Queens General Hospital, and Abram Belskie, Sculptor Academy of Medicine, New York, Queens County Cancer Committee, Jamaica, L. I.:

Teaching Cancer by Models: Life size medical sculptures in full color with interchangeable parts demonstrating anatomy and varieties of neoplasms, with emphasis on early cancer. Different consistencies of the rubber permit palpation. The exhibit includes sculptured pieces of the head and neck, breast, prostate and bladder, female pelvic organs and torso, with removable organs of the thorax and abdomen.

Jacob J. Weinstein, George Washington University Medical School, Washington, D. C.:

Protein Metabolism in Surgery; Use of Oral and Parenteral Protein Hydrolysate: Charts show (1) incidence of hypoproteinemia preoperative, (2) blood changes after operation, (3) mechanism of hypoproteinemia and clinical manifestations, (4) postoperative nitrogen balance studies, (5) postoperative nitrogen balance studies with intravenous protein hydrolysate, (6) postoperative nitrogen balance studies with oral protein hydrolysate, (7) effects of intravenous, subcutaneous, intramuscular and oral protein hydrolysate on blood and urine (8) and reactions with parenteral administration.

L. E. Holmgren, Jackson Clinic, Madison, Wis.:

Varicose Veins—Diagnosis and Treatment: Charts and drawings explain the necessity of individualization of each case for determining the proper type of therapy to use. Anatomic drawings and drawings which illustrate a special diagnostic test are shown. Charts and moulages illustrate surgical steps in the high ligation of the saphenous vein. Charts and moulages also illustrate the treatment of varicose ulcers. The end results of some 700 cases are presented.

John O. Bower, Foundation for Clinical and Surgical Research, Philadelphia General Hospital, Philadelphia:

Hyperplasia—Hyperplasia in the Healing of Injured Tissue as Affected by Hemoglobin, Foreign Bodies, Foreign Proteins and Other Chemical Compounds, Poisonous and Nonpoisonous, Absorbable and Nonabsorbable: Photomicrographs show early and progressive hyperplasia followed by normal tissue regression and repair after embedding sutures impregnated with hemoglobin; encapsulative hyperplasia following the embedding of nonabsorbable sutures—silk, cotton and linen; delayed hyperplasia following the embedding of plain surgical gut (foreign protein) and delayed atrophic hyperplasia following the embedding of chromicized gut. Photographs and photomicrographs show: (1) A new method of determining the cellular response to nontoxic and toxic absorbable and nonabsorbable compounds. The nontraumatic liver contact response to plain, chromicized and hemoglobin impregnated sutures in powder form, the sulfonamides, tannic acid, gauze, silk, cotton, linen, gallstones and other absorbable and nonabsorbable material. (2) The hemoglobin electrolyte stroma solution for treatment of burns—a new method for the treatment of the initial shock, the prevention of secondary shock and infection and the promotion of early epithelization. (3) The use of hemoglobin electrolyte stroma solution combined with penicillin in the management of compound fractures. (4) The use of hemoglobin electrolyte stroma penicillin solution in the preparation of the epidermis for surgical procedures.

Edgar J. Poth, L. J. Manhoff Jr. and Joseph P. McNeill, University of Texas Medical Branch, Galveston, Texas:

Healing of Bowel, as Influenced by Succinylsulfathiazole and Phthalylsulfathiazole: An experimental demonstration of the influence of the intestinal bacterial flora on the healing process following bowel suture is presented. The subject matter is illustrated by drawings and gross and microscopic color photographs of control preparations contrasted with the findings after modifying the bacterial flora of the bowel by the administration of succinylsulfathiazole and phthalylsulfathiazole.

Stuart W. Harrington, Howard K. Gray and O. Theron Clagett, Mayo Clinic, Rochester, Minn.:

Surgical Treatment of Certain Intrathoracic Lesions: The exhibit deals with diagnosis and surgical treatment of (*a*) lesions of the esophagus such as benign and malignant tumors and esophageal and pharyngeoesophageal diverticula; (*b*) extrapulmonary lesions such as neurofibromas, teratomas and thymoma; (*c*) intrapulmonary lesions such as carcinomas of the lung and bronchus, bronchial adenomas, hamartomas and pulmonary suppurative diseases; (*d*) cardiac lesions such as chronic constrictive pericarditis and patent ductus arteriosus.

Champ Lyons, H. S. Mayerson and Paul T. DeCamp, Tulane University, New Orleans:

Chronic Shock, the Problem of Reduced Blood Volume in the Chronically Ill Patient: The surgically significant feature of protein depletion is a reduced blood volume. Deficiencies of total circulating hemoglobin frequently outweigh deficiencies of tissue protein. These features have been correlated in a syndrome of "chronic shock." The exhibit presents the evidence validating quantitative aspects of transfusion therapy. It is shown that correction of blood volume preoperatively is a clinically practical method of preparing the patient with protein depletion for any needed operation. Increased dietary protein is reserved for especial emphasis in the postoperative care of patients after surgical correction of the etiologic factors contributing to protein depletion.

Bernard Judovich, William Bates and Maurice Jacobs, Graduate School of Medicine, University of Pennsylvania, Philadelphia:

Scalenus Anticus Syndrome: Etiology, anatomy, symptoms, physical signs, differential diagnosis and treatment are shown.

There are presentations of a hypodermic needle technic for diagnostic and therapeutic infiltration, atypical cases of scalenus anticus syndrome, primary and secondary scalene syndromes and differentiation, and cases simulating the pain of coronary diseases, electrocardiograph changes induced by compression of the subclavian artery, brachial plexus and suggested mechanism for postcoronary shoulder pain.

E. S. Gurdjian, J. E. Webster and H. R. Lissner, Wayne University College of Medicine and Grace Hospital, Detroit:

Mechanism of Production of Linear Skull Fracture. Studies with the Stresscoat: This material consists of experimental work in dogs, monkeys and human studies on cadaver and dry skulls with the Stresscoat technic. A strain sensitive lacquer is applied on the external and internal surfaces of the skull; deformation of the skull from blows causes cracks in the lacquer, showing the pattern and direction of the strains. It has been shown that the skull of the dog and the monkey under pentobarbital sodium anesthesia has strain patterns similar to the dry skull in the same animal. The strain patterns of human cadaver skulls and dry skulls are also similar. When both the external and internal surfaces are available for study, bending activity of the skull can be visualized. Following impact there is an area of inbended bone. Peripheral to this region there is selective outbending of the skull, as shown by the Stresscoat technic. Linear fractures are initiated at a distance from the point of impact and result from outbending of the bone. The fracture line propagates toward the point of impact and in the opposite direction.

Arkell M. Vaughn, John W. Howser and William M. Lees, Mercy Hospital and Loyola University School of Medicine, Chicago.

Surgery of the Stomach: History of gastric surgery from Bilroth's number 1 gastrectomy in 1881 to Dragstedt's vagus nerve resection in 1943 is shown. Indications and contraindications for gastroenterostomy, gastric resection, gastrostomy, gastrotomy and so on are demonstrated. Diagrams and sketches show the various types of operative procedures and other charts showing roentgenograms before and after surgery of the stomach.

James L. Poppen, the Lahey Clinic, Boston:

Neurosurgery: This exhibit covers intracranial aneurysms with results based on 103 verified cases. It shows colored photographs of actual specimens with data regarding handling of cases. Hypertension is taken up from the point of view of the surgeon with operative technic of splanchnicectomy shown by drawings. Photographs of splanchnic nerves resected intact and data regarding indications and contraindications of treatment are presented.

Bowman C. Crowell, Malcolm T. MacEachern and George H. Miller, American College of Surgeons, Chicago:

One Hundred Years' Progress in the Development of Cancer Detection Centers, Hospitals and Surgery: The exhibit demonstrates certain scientific and educational phases of the work of the American College of Surgeons, including cancer detection centers, hospitals and surgery.

Section on Obstetrics and Gynecology

The representative to the Scientific Exhibit from the Section on Obstetrics and Gynecology is Frederick H. Falls, Chicago.

Joe V. Meigs, Ruth M. Graham, Maurice Fremont-Smith, Somers H. Sturgis, Deloris Chapman and Marjorie Soule, Vincent Memorial Hospital, Massachusetts General Hospital, Boston:

Carcinoma of the Cervix: A New Method of Prognosis: The vaginal smear from cases of cervical carcinoma during irradiation shows pronounced and characteristic changes. These have been shown to have prognostic value. The presence of the typical reaction of both normal and malignant cells to radiation may be regarded as a good response and the absence of the reaction as a poor response. Clinical follow-up of these cases has confirmed this prognosis. Photomicrographs of the cellular changes, charts and case reports are presented to demonstrate the importance of the vaginal smear in the prognosis of carcinoma of the cervix treated with radiation.

Milton S. Sacks, William Kuhns and Elsa Jahn, University of Maryland School of Medicine, Baltimore Rh Typing Laboratory, Baltimore:

Studies in Rh Isoimmunization in Pregnancy: The Baltimore Rh Typing Laboratory, sponsored by the Obstetrical and Gynecological Section of the Baltimore City Medical Society and established in August 1945, was intended to serve as a central laboratory for Rh studies on the pregnant patients of any physician in the community. Approximately twelve to fifteen hundred women are being studied per month. The method of operation of this community service will be described. Quantitative and qualitative antepartum and postpartum antibody studies and their correlation with outcome of pregnancy will be presented.

Willis E. Brown, James T. Bradbury and A. F. Jennings, University of Iowa, Iowa City:

Comparative Studies of Radiopaque Substances Used for Salpingography: The exhibit shows roentgenograms of five currently used commercial products to demonstrate their effectiveness in casting radiographic shadows, their time of absorption from the pelvis, microscopic studies of the human tubes removed after such studies, gross and microscopic studies of the rabbit tubes following the injection of these agents and a collection of the unusual intrauterine pathologic changes delineated by these methods.

A. Herbert Marbach, Jewish Hospital, Philadelphia:

The Infected Cervix—Pathology and Treatment: Moulages of two pelves are shown with vaginal specula in situ. There is a control dial on each moulage which, when rotated, brings the various types of infected cervices into view on the one moulage and the types of treatment and the postoperative course on the other moulage. The histopathology of the cervix preoperatively and every day postoperatively until healing takes place is also presented, with emphasis on the use of conization as an ideal method for treating the infected cervix. The follow-up treatment is stressed, with the use of chemotherapeutic agents in promoting more rapid healing.

Bernard Berglas and I. C. Rubin, Mount Sinai Hospital and New York University Medical School, New York:

The Supporting Mechanism of the Uterus; Anatomic and Functional Principles (Based on the Study of Gross and Microscopic Anatomy of Pelvic Connective Tissue and X-Ray Myography of the Levator Ani Muscle): Transparencies show (1) full life size sections of pelvis with latex injected blood vessels and (2) anatomic and functional characteristics of the levator ani muscle in the living subject, as determined by intramuscular injection of radiopaque solution.

A. P. Hudgins, Charleston, W. Va.:

Modifications in Technic for Perineal Repair: Variations are presented in technic in the perineal repair which accomplish (1) ease and precision in accomplishing an anatomic dissection, (2) minimum blood loss and (3) good exposure and identification of tissues for accurate approximation. The technic is applicable when tissues are friable, postoperative healing is satisfactory and it is time saving.

Herbert Kupperman and Robert B. Greenblatt, University of Georgia School of Medicine, Augusta, Ga.:

The Two Hour Pregnancy Test: The evolution of the two hour pregnancy test is presented and the technic depicted in charts, pictures and paintings. The physiologic basis of the hyperemic reaction is discussed and data are presented to indicate the role of the luteinizing and luteotrophic hormone in producing ovarian hyperemia. A comparison of the accuracy of the two hour test with that of the Friedman test is made. The advantages of the two hour test are enumerated and compared with those of the other tests. Charts are presented on the three most popular tests now in use and a short description is given of the performance of these tests.

Paul F. Fletcher, St. Louis University School of Medicine and the St. Louis County Hospital, St. Louis:

Abdominal Colpocystopexy for Complete Prolapse of the Bladder and Vagina: The rectus suspension principle of operative treatment for complete prolapse of the bladder and vagina following panhysterectomy is presented in detail. Living fascial strips mobilized from the anterior sheath of the rectus muscle on each side are employed in such a manner as to effect permanent restoration of the normal anatomic relationships of these viscera in the pelvis. A crossed suspender support is thus provided for both bladder and vagina, but may be applied to the bladder alone when ventral fixation of the vaginal vault is to be preferred. A case showing each step in the operative technic is presented graphically and in colored pictures. The analysis of a five year follow-up study of results obtained is included.

Karl John Karnaky and Frank Poche, Jefferson Davis Hospital, Houston, Texas:

Lesions of Vulva, Vagina and Cervix: Photographs of various lesions of the vulva, vagina and cervix are presented, together with models of various lesions of labia, vagina and cervix. An attempt to establish the relation of the hydrogen ion concentration (p_H) to various lesions of vagina and cervix is shown.

F. H. Falls, University of Illinois College of Medicine, and Charlotte S. Holt, Illinois State Department of Public Health, Chicago:

Puerperal Sepsis: Moulages, models, drawings, photomicrographs, charts and graphs depicting the etiology, pathology, diagnosis and treatment of various forms of puerperal sepsis are shown. The subject of puerperal sepsis is presented as part of the program of visual education in Illinois. It is a cooperative educational program between the State University and the State Department of Public Health and is used in the instruction of undergraduate and postgraduate medical students, interns and nurses throughout the state.

Section on Ophthalmology

The section exhibit committee of the Section on Ophthalmology consists of Georgiana D. Theobald, Oak Park, Ill., chairman; Derrick Vail, Chicago, and A. B. Reese, New York.

C. S. O'Brien, Lee Allen, James H. Allen and Sherwood P. Burr, State University of Iowa College of Medicine, Iowa City:

Gonioscopy: Drawings show various chamber angles as seen with the Allen prism gonioscope. Models and diagrams demonstrate the principles of this gonioscope.

Albert D. Ruedemann and Otto Glasser, Cleveland Clinic, Cleveland:

Use of Radium in Ophthalmology: The various uses of radium in ophthalmology and the end results to be expected are shown.

Abraham L. Kornzweig, Mount Sinai Hospital, New York:

Embryonic Development of the Human Cornea, Sclera and Corneoscleral Junction: Photomicrograph transparencies show the embryonic development of the human cornea, sclera and corneoscleral junction from the fourth week of embryonic life up to term. The importance of the corneoscleral junction in the development of the anterior segment of the eye is emphasized. The different rates of growth of the different sections of the sclera are shown, together with their possible relationship to the clinical development of myopia. The congenital anomalies of the cornea and sclera are presented, and a graph exhibiting the differences in the rate of growth of the cornea and the sclera is included.

Hunter H. Romaine, New York Eye and Ear Infirmary and New York University Reading Clinic, New York:

Reading Disabilities: Some of the various concepts of the causes of reading disability and the present trend in treating this disability are presented. Many factors are concerned, and this exhibit attempts to consolidate the picture as far as it is possible, placards and photographs being used to indicate the methods of approach.

Franklin M. Foote and Florence Nelson, National Society for the Prevention of Blindness, Inc., New York:

Causes of Blindness: Three large panels, illustrated, show leading causes of blindness and indicate problems in research and education which are of most importance in prevention of blindness programs.

Ernest Sheppard, George Washington University School of Medicine, Washington, D. C.:

A Simple Technic of Low Magnification Gonioscopy: Gonioscopic drawings and demonstration with the Obrig gonio lens show a simple technic of low magnification gonioscopy.

Adolph Posner, Abraham Schlossman and Otto Lowenstein, New York:

Practical Points in the Diagnosis and Management of Glaucoma: The exhibit consists in demonstration of (1) standardized simplified tangent screen unit for quantitative field studies; (2) model of a modified Schiötz tonometer, together with the technic of tonometry; (3) pedigrees of glaucoma families to emphasize the importance of careful history taking; (4) charts illustrating the course of primary glaucoma in patients followed over periods of five to thirty years, and (5) pupillographic studies in glaucoma.

Peter Kronfeld and H. Isabelle McGarry, Illinois Eye and Ear Infirmary and College of Medicine, Chicago:

A Five Year Follow-Up of Glaucomas: The exhibit is based on a follow-up study over a period of at least five years of a representative number of so-called primary glaucomas and of glaucomas secondary to cataract extraction.

Section on Laryngology, Otology and Rhinology

The representative to the Scientific Exhibit from the Section on Laryngology, Otology and Rhinology is Paul H. Holinger, Chicago.

Julius Lempert, Philip E. Meltzer and Leroy Schall, Massachusetts Eye and Ear Infirmary, Boston, and Dorothy Wolff, New York:

Surgical Treatment of Clinical Otosclerosis: A. Histology and pathology. Photomicrographs at fenestrations of monkeys show natural process of bone regeneration and results of attempts to present it; human ossicles removed at the fenestration operation show degenerative changes; photomicrographs of bony lid of fenestra, cartilage stopple, petrasa showing Jacobson's nerve and ganglions are shown with microscopic slides of these subjects. B. Restoration of practical and serviceable unaided hearing. Cadaver specimens show each individual step of the fenestra for ovalis operation; drawings depict the continuance solution of fenestration surgery; demonstration of Lempert visatron for projecting the surgical field for teaching purposes; demonstration of Lempert scope for taking motion pictures of surgical field.

Louis H. Clerf and Peter A. Herbut, Jefferson Hospital, Philadelphia:

Progress in Diagnosis of Bronchogenic Carcinoma: Progress in the diagnosis of bronchogenic carcinoma during the past twenty-five years is shown, together with instruments developed and used during this period, and statistical studies of diagnosis and their influence on treatment. The results obtained by cytologic study are included.

James S. Greene, National Hospital for Speech Disorders, New York:

Treatment of Speech and Voice Disorders: Photographs illustrate diagnostic and therapeutic procedures carried out in a model speech clinic. A series of lantern slides of facial parakinesias associated with stuttering and of various oral and laryngeal defects associated with other speech and voice disorders are shown.

George E. Shambaugh Jr., Arthur L. Juers and Charles Whitaker, Chicago:

Fenestration Operation: New Improved Technic based on Experimental Studies: Exhibit of photomicrographs show the factors that influence osteogenesis and labyrinthitis after experimental fenestration of the labyrinth in the monkey. Models show the technic of the new improved fenestration operation. Charts show the history of the fenestration operation, indications and results.

J. Brown Farrior, Ochsner Clinic, Tulane Medical School, New Orleans:

Ear Surgery: Anatomic dissections of ear operations with accompanying anatomic drawings and explanatory descriptions are shown. The classic ear operations and the modern advances in the surgical treatment of deafness, facial paralysis and Ménière's disease are demonstrated, together with the simple mastoidectomy, the complete mastoidectomy, the radical and modified radical mastoidectomy, the fenestration operation for otosclerosis, petrous apicectomies, decompression, grafting and rerouting of the facial nerve, labyrinthectomy and electrocoagulation of the labyrinth for Ménière's disease.

Gordon B. New, F. A. Figi, F. Z. Havens and John Erich, Mayo Clinic, Rochester, Minn.:

Cancer of the Larynx—Methods of Treatment and Results: The exhibit is divided into four parts: (1) diagnosis of cancer of the larynx; (2) treatment of laryngeal cancer by suspension laryngoscopy and thyrotomy; (3) treatment of laryngeal cancer by laryngectomy, and (4) statistical analysis of cancer of the larynx. Various phases of diagnosis and treatment of cancer are depicted by means of photographs, photomicrographs and models.

Chevalier L. Jackson, Charles M. Norris and Walter Maloney, Temple University Hospital and School of Medicine, Philadelphia:

Foreign Bodies in the Air and Food Passages and Their Role in the Development of Bronchoesophagology: The history of bronchoscopy and esophagoscopy is presented in outline form, and specimens of early instruments are shown. Salient features of disease of foreign body origin are presented from point of view of etiology, symptomatology and diagnosis, pathology and treatment. The mechanism of bronchial obstruction by foreign body and the importance of its manifestation by physical signs and roentgen examination in diagnosis of foreign body as well as in diagnosis of disease of other than foreign body origin are demonstrated. Actual specimens of foreign bodies are displayed and interesting facts regarding the case histories of typical cases are given, including explanation of the mechanical problems presented and the methods of their solution.

Section on Pediatrics

The representative to the Scientific Exhibit from the Section on Pediatrics is Albert V. Stoesser, Minneapolis.

Willis J. Potts, Stanley Gibson and Sidney Smith, Children's Memorial Hospital and Northwestern University Medical School, Chicago:

Aortic Pulmonary Anastomosis for Pulmonary Stenosis: The exhibit shows (1) the diagnosis of pulmonary stenosis (tetralogy of Fallot) illustrated by roentgenograms, electrocardiograms and brief histories of typical cases; (2) the experimental work on approximately 30 dogs: development of the operation, drawings, specimens and demonstration of the clamps; (3) results in patients operated on: technic, mortality and outcome.

Milton I. Levine and Helene Eliasberg, Cornell University Medical College, New York:

The Chest in Infants and Children: Chest roentgenograms illustrate pathologic changes in the mediastinum and lungs of infants and children. A brief description accompanies each plate, directing attention to salient features.

Alfred D. Biggs, Northwestern University Medical School and St. Luke's Hospital, Chicago:

Primary Tuberculosis—A Correlation of the Clincal and Roentgen Ray Findings in 115 Cases: The Vollmer patch agrees with purified protein derivative tests in 97 per cent of the entire series, the Vollmer patch being a little less sensitive. Primary tuberculosis is a subclinical disease and can be detected only by a tuberculin test. Its course is best followed by serial roentgenograms. These groups are to be enlarged and followed through adolescence and beyond. If allergy is the dominant factor, the morbidity and mortality rate will be higher in the positive reactors. If immunity is the dominant factor, the morbidity and mortality rate will be lower in the positive group.

A. L. Van Horn, U. S. Children's Bureau, Washington, D. C.:

Rheumatic Fever: The exhibit describes the grant-in-aid program for children with rheumatic fever and a study of mortality from rheumatic fever.

Harold W. Dargeon, Memorial Hospital Center for Cancer and Allied Diseases, New York:

Tumors of Childhood: Common varieties of tumors, benign and malignant, occurring in children, birth to 15 years, are illustrated. Statistical charts show position which neoplasms occupy in mortality during childhood.

Charles F. McKhann and Samuel Spector, Babies and Children's Hospital, Cleveland:

The Malnourished Child: The exhibit depicts the incidence, causation and the approach to and alleviation of chronic malnutrition in children. The major cause for chronic malnutrition as observed in this clinic has proved to be not dietary insufficiency but disease in the child.

Donald B. Armstrong and George M. Wheatley, Metropolitan Life Insurance Company, New York:

The School Child, Health Progress and Needs: Charts describe the conquest of childhood diseases; evidences of improvement in physical status of school children; current problems of child health as revealed by mortality and morbidity are demonstrated by statistics and photographs; the principles of case finding, prevention and care are stated.

John P. Hubbard, American Academy of Pediatrics Study of Child Health Services, Washington, D. C.:

Study of Child Health Services: The organization, development, conduct and purpose of a nationwide study of child health services being currently conducted by the American Academy of Pediatrics is shown.

Section on Experimental Medicine and Therapeutics

The representative to the Scientific Exhibit from the Section on Experimental Medicine and Therapeutics is Robert W. Wilkins, Boston.

F. F. Tisdall, Committee on Nutrition, Canadian Medical Association, Toronto, cooperating with the Council on Foods and Nutrition, American Medical Association, Chicago:

Physical Signs of Nutritional Failure: A group of colored illustrations show physical manifestations of nutritional failure.

Rita S. Finkler, George M. Cohn and N. James Furst, Newark Beth Israel Hospital, Newark, N. J.:

Osteopathies Encountered in the Endocrine Clinic: The group consists of thyropituitary dysfunction, Turner's syndrome, Lorain-Levy dwarfism, hypogenitalism with polyostotic fibrous dysplasia, pseudo Froehlich's syndrome with osteogenesis imperfecta, pituitary adenoma with acromegalic manifestations and macrosomia genitalis with accelerated bony maturation. Presentation consists of before and after photographs of the patient, x-ray prints at various stages of period of observation, laboratory findings, synopsis of clinical and laboratory findings and discussion. The group of cases presented have been seen in the Endocrine Clinic of the Newark Beth Israel Hospital. These cases have been referred by various sources and have demonstrated a common denominator of osseous pathologic change. In some cases the etiology could be definitely assumed to be endocrine dysfunction; in others no definite endocrine etiology could be demonstrated even though these cases were referred under the assumption that some obscure endocrinopathy was present.

Janet G. Travell, Seymour H. Rinzler, Audrie L. Bobb, Nolton H. Bigelow and Lawrence W. Hanlon, Cornell University Medical College, New York:

Somatic Pain Syndromes: Clinical data obtained in several hundred subjects with pain due to various disorders of the myofascial structures is presented. Many of the commonly occurring referred pain patterns, which are shown to be relatively constant from individual to individual, are mapped for different regions of the body. The role of the somatic component in visceral pain reference, as observed in patients with acute myocardial infarction, is demonstrated. The basis for the therapeutic effects of local block of somatic trigger areas by means of ethyl chloride spray, dry needling and infiltration with procaine hydrochloride or isotonic solution of sodium chloride is analyzed.

George R. Meneely, Robert Furman and Robert Gale, Vanderbilt University School of Medicine, Nashville, Tenn.:

Experimental Myocardial Infarction—The Capillary Factor: Following brief temporary ischemia of the left ventricle, classic electrocardiographic changes indicative of myocardial infarction may develop despite reestablishment of circulation. Temporary ischemia may result in local permeability to colliodal dyes or radioactive isotopes. Conversely, general asphyxia results in diffuse myocardial capillary permeability at times and at other times results in local capillary injury causing an infarct. Graded histologic changes ranging from mere edema to permeability of the capillaries to red cells occurs, depending on the duration of local ischemia. It is concluded that temporary ischemia or asphyxia can injure myocardial capillaries and set the stage for infarct even if the artery reopens.

Charles F. Geschickter, Georgetown University Medical School, Washington, D. C.:

Oil Soluble Metals in the Treatment of Leukemia: Charts show the clinical history and hematologic response of leukemia patients to oil soluble copper and nickel compounds. Photomicrographs of blood smears, bone marrow and so on in color are included.

Benedict E. Abreu, Henry W. Elliott, Grant W. Liddle and Carroll A. Handley, University of California Medical School, San Francisco:

Drugs Affecting Cerebral Circulation and Metabolism: Changes produced on cerebral circulation and in vivo and in vitro cerebral metabolism by central nervous system depressants and by agents effective in the therapy of migraine are demonstrated. Analysis of effects on metabolic processes transpiring in the nervous system as indicated by in vitro metabolism studies (Warburg technic) are shown, together with correlation of changes produced in vitro with those observed in the intact mammalian central nervous system.

Joseph M. Hill, Sol Haberman and E. E. Muirhead, Baylor Hospital and Southwestern Medical College, Dallas, Texas:

CDE (Rh-Hr) Blood Antigens and Antibodies: New information in respect to the CDE (Rh-Hr) blood antigens, together with original work on the corresponding antibodies, is presented. Clinical applications and the need for routine Rh typing are shown and practical simplified typing technics are demonstrated.

Robert A. Woodbury, George P. Child, Frank Jones, Charles W. Hock, George McInnes and Richard Torpin, University of Georgia School of Medicine, Augusta, Ga.:

Treatment of Pylorospasm and Peptic Ulcer with Asymatrine Hydrobromide: Asymatrine hydrobromide, diethylaminoethyl phenylthionylacetate hydrobromide, has a pronounced effect in reducing pylorospasm and gastric hypermotility, thereby causing a return to normal activity. It has no direct influence on gastric hyperacidity though it sometimes reduces it, apparently by improving pyloric activity. It has proved to be very effective in the treatment of peptic ulcer, pylorospasm, nervous indigestion and some headaches initiated with gastric distress. When hyperacidity is present, this should be controlled with antacids. Asymatrine has not produced mydriasis cycloplegia or cutaneous flush in any patient even though doses far above the therapeutic level have been administered. Slight nervousness was observed in only 1 of the 400 patients who received therapeutic doses. This was transient in nature and disappeared even though therapy was continued.

Kurt Lange, David Weiner and Linn J. Boyd, New York Medical College, New York:

Nephrosis. New Concepts of Functional Pathology and Therapy of the Nephrotic Stage: The nephrotic stage of chronic glomerular nephritis is a generalized disease of the small vessels with a tremendous increase in capillary permeability. The edema formation is due to this fact and not primarily to the lowered colloid osmotic pressure. A new simple method for rapidly and accurately determining the colloid osmotic pressure of plasma indicates that edema appears and disappears independently of the colloid osmotic pressure but is paralleled by the changing capillary permeability as measured by the fluorescein method. The same can be noticed in edema due to starvation and in myxedema. Some common errors in the treatment of the nephrotic syndrome as, for example, the use of plasma transfusion, will be explained. With a reduced glomerular filtration area the increased permeability of the glomerular capillaries is essential to prevent retention of metabolites. This is illustrated by the fact that tightening of the capillaries by calcium leads to a reversible azotemia. The one hour excretion of fluorescein is a good test of glomerular function, as demonstrated by the parallelism between inulin clearance and fluorescein excretion tests.

Norman Jolliffe, the Nutrition Clinic, Department of Health of the City of New York and the Department of Preventive Medicine, New York University College of Medicine, New York:

Signs of Nutritional Deficiency Disease: The exhibit illustrates (1) skin lesions associated with vitamin A deficiency; (2) hemorrhagic manifestations of vitamin C and K deficiency; (3) dyssebacia associated with riboflavin deficiency; (4) skin lesions of pellagra; (5) conjunctival lesions sometimes attributed to deficiency of vitamin A and riboflavin; (6) eye lesions sometimes attributed to nutritional deficiency; (7) lip lesions associated with nutritional deficiencies; (8) tongue lesions manifested chiefly by color changes; (9) stages of chronic glossitis; (10) stages of chronic gingivitis.

Earl R. Loew and Klaus R. Unna, University of Illinois College of Medicine, Chicago:

Pharmacology of Antihistamine Drugs: The chemical nature, toxicity, side-actions and pharmacologic actions of the antihistamine drugs neoantergan, benadryl and pyribenzamine are shown. These drugs prevent or diminish the prominent effects of histamine such as bronchoconstriction, intestinal and uterine spasm, vasodilatation and wheal and edema formation, but not secretagogue effects of histamine on gastric glands. Laboratory findings are compared or contrasted with information concerning clinical effectiveness. The evidence supporting the contention that histamine is a major cause of anaphylactic manifestations will be summarized.

Alvan L. Barach, Bettina Garthwaite and Hylan A. Bickerman, Presbyterian Hospital and College of Physicians and Surgeons, Columbia University, New York:

Penicillin Treatment of Bronchopulmonary Disease: The clinical results of penicillin aerosol therapy will be presented in the following clinical entities: bronchiectasis, lung abscess, sinusitis, bronchial asthma and chronic bronchitis. Laboratory data will include concentration of penicillin in the blood and sputum as well as the effect of treatment on predominating organisms. The effectiveness of various technics of aerosol therapy will be presented.

William H. Feldman and H. Corwin Hinshaw, Mayo Clinic, Rochester, Minn., and Karl Pfuetze, Mineral Springs Sanatorium, Cannon Falls, Minn.:

Streptomycin, Experimental and Clinical Observations: Charts, photographs, photomicrographs and roentgenograms demonstrate (*a*) the effect of streptomycin in experimental tuberculosis in guinea pigs and (*b*) the effect of the drug on various types of clinical tuberculosis.

George T. Harrell, Bowman Gray School of Medicine, Winston-Salem, N. C.:

Reaction in Human Beings to Lipid Fractions of Human Tubercle Bacilli: The chemical derivation of the fractions from the whole bacillus is shown, with descriptions of the three fractions phosphatide acetone soluble fat and wax used in these experiments. The cellular reaction in the biopsies of human beings is presented, as well as descriptions of the cellular reaction in guinea pigs. Photographs of the legs of patients at different intervals showing the reactions produced illustrate tuberculosis (incipient, moderately advanced and far advanced), sarcoid and normal or psychotic individuals for comparison. Photomicrographs of the reactions and kodachrome slides show the reactions in these groups at various stages. The highly reactive character of phosphatide, the nonspecific and variable reactions to acetone soluble fat, a constant nonspecific ulceration to the wax are shown. Sarcoid is not an altered reaction to a lipid fraction of the tubercle bacilli.

Henry Turkel, Detroit; J. Joe Quilligan and James T. Mason, University Hospital, University of Michigan, Ann Arbor:

Tissue Biopsies and Bone Marrow Infusions: Demonstrations of the trephine method of biopsies of bone marrow, liver, prostate and bone marrow infusions are presented.

Section on Pathology and Physiology

The representative to the Scientific Exhibit from the Section on Pathology and Physiology is Frank W. Konzelmann, Atlantic City, N. J.

Benjamin T. Terry, Tacoma, Wash.:

Razor Section Technic and the Polychroming of Methylene Blue: Razor section technic has been thoroughly tested in private and in hospital practice. In tissue pathology it has proved to be dependable and very helpful. Usually in sixty seconds or less a section of tissue can be cut, stained and mounted ready for immediate diagnosis microscopically. The technic is applicable to most fresh unfixed tissues and to tissues recently thoroughly fixed in solution of formaldehyde. The instruments used are inexpensive, and the technic is so simple that any one can learn it easily and quickly. To those interested, opportunity will be given to practice it under supervision. A new and simple way to prepare and neutralize polychrome methylene blue will also be demonstrated.

Carroll L. Birch and Louis R. Limarzi, University of Illinois College of Medicine, Chicago:

Bone Marrow: Evaluation of various methods of bone marrow study are illustrated by transparencies accompanied with enlargements in natural color of bone marrow pictures in various blood dyscrasias. A series of five illustrations depict the development of bone marrow.

Max M. Strumia and J. Ivan Hershey, Bryn Mawr Hospital, Bryn Mawr, Pa.:

Embedding of Tissues in Transparent Plastic: A method for the embedding of human tissues in a transparent plastic is presented. The method consists in freezing of the fresh specimens, dehydration of these specimens by sublimation of water in vacuo by means of low temperature condensation while the specimens are kept in the frozen state, impregnation of the dehydrated specimen with the monomer methyl methacrylate, polymerization of the monomer to a solid "Plexiglas" cutting and polishing. This means allows the preservation of portions of human organs or whole organs without distortion and with good color preservation. This method is applicable to many biologic specimens, insects and plants. The exhibit includes a large number of specimens of human tissues thus embedded as well as a few biologic specimens.

Harold S. Tuft, Richard E. Rosenfield, David R. Weill Jr. and K. Y. Yardumian, Montefiore Hospital, Pittsburgh:

Thromboembolic Disease: Photographs and a mannequin demonstrate the etiology, pathogenesis and pathologic physiology of the intravascular clotting phenomenon. Diagnosis as aided by the heparin tolerance principle and treatment based on the estimation of prothrombin activity under dicumarol therapy are also presented.

Jane S. Robb, Cornelius T. Kaylor and William G. Turman, Syracuse University College of Medicine, Syracuse, N. Y.:

Distribution of Nerves and of the "Conducting" System in the Human Heart—Suggestions Regarding Function: Photomicrographs, paintings and reconstructions in plastic and in wax indicate the course and distribution of the conducting system and of the ventricular nerves. Complete serial sections of several human fetal hearts were taken (*a*) from a 16 weeks fetus stained by the Mallory technic, (*b*) from a 5½ months fetus stained with Masson's technic and (*c*) two other series obtained at approximately the fifth month and stained by the Cajal silver nitrate method for nerve structures.

Milton G. Bohrod and John J. Beiter, Rochester General Hospital, Rochester, N. Y.:

Medical Photography in a General Hospital: The exhibit shows the work of a photographic department in a medium sized general hospital. Use of photography for record and education in clinical medicine, in pathology, in the demonstration of methods and in hospital public relations is presented, together with examples of complete photographic case studies, comparison of the old pathology museum with a photographic library, advantages of use of photographs over demonstration of actual patients in conferences and demonstration of simple equipment as aids in producing good pictures.

Jacob Furth, Cornell University Medical College, New York:

Induction and Characteristics of Ovarian Neoplasms with Hormonal Changes and Hypervolemia: A chart shows relation of time and dose to induction of ovarian neoplasms by roentgen rays and other methods. Illustrations and charts show the different types of induced and transplanted tumors (granulosa cell, luteomas, tubular adenomas and chorionepitheliomas) and the secondary changes (feminizing and virilizing) they produce. The pathology and pathogenesis of hypervolemia (increased blood volume) secondary to transplanted granulosa cell tumors are shown, together with methods of measuring blood.

Laurance W. Kinsell, Harry Weiss, George Michaels, Earl Evans, Harry Barton and John Shaver, United States Naval Hospital, Oakland and University of California Medical School, San Francisco:

The Pathologic Physiology of Liver: The exhibit correlates abnormalities in liver function, as determined chemically, with abnormalities in liver structure, as obtained in serial liver biopsies in patients with cirrhosis of the liver. Current concepts of pathogenesis and treatment are presented diagrammatically.

Hans Popper, Frederick Steigmann, Karl A. Meyer, Donald D. Kozoll and Murray Franklin, the Hektoen Institute for Medical Research of the Cook County Hospital, Chicago:

Clinical Application of Liver Function and Liver Structure: Based on clinical observation, laboratory study and histopathologic examination of needle or surgical biopsy and necropsy specimens of a large series of patients with liver diseases, a correlation between structural and functional changes of the liver is demonstrated. This correlation leads to a better evaluation of the functional and morphologic methods used in the clinical diagnosis of liver diseases and of the rationale and indications of their therapy. Furthermore, a classification of acute hepatitis into infectious (viral), toxic, biliary (obstructive) and purulent forms is presented and an attempt of a similar division of chronic hepatitis (cirrhosis) is illustrated. The exhibit shows the extent to which modern laboratory procedures, including liver biopsies, can be used in the clinical management of hepatic diseases.

Timothy Leary, Mallory Institute of Pathology, Boston:

Irritant Crystalline Ester Cholesterol and Atherosclerosis: The exhibit illustrates the characteristics of crystalline ester cholesterol in health and disease; presents evidence that this substance will produce in the experimental rabbit lesions (cirrhosis of liver, enlargement of spleen, chronic nephritis) corresponding to those accepted by Gye and Purdy as characteristic of chronic silica poisoning; demonstrates that crystalline ester cholesterol is present in all active atherosclerotic lesions.

David B. Tyler, California Institute of Technology, Pasadena, Calif. (present address Army Chemical Center, Medical Division, Edgewood Arsenal, Md.):

Effects of Prolonged Wakefulness on Man: The physiologic, biochemical and psychologic findings in prolonged wakefulness are presented. Data were obtained from twenty experiments involving 600 subjects who submitted to voluntary insomnia for periods up to one hundred and twelve hours. Special emphasis is placed on the electroencephalographic changes.

Charles P. Larson and Murray L. Johnson, Tacoma General Hospital, Tacoma:

Surgical Diseases of the Ovary: Specimens demonstrate all the various pathologic lesions of the ovary as well as the normal physiologic changes occurring in the ovary which are often misinterpreted at surgery as being pathologic lesions calling for oophorectomy. Charts show the analysis of the pathologic study of all oophorectomies over a five year period from nine different hospitals, including one county hospital. The various lesions encountered are classified according to frequency and percentage. The total percentage of ovaries removed in which no pathologic lesion was observed is computed for each hospital, with comments. The exhibit stresses the various physiologic changes which are often misdiagnosed by surgeons as pathologic changes. Microscopic slides of the various pathologic lesions are available for study.

S. E. Gould, Wayne County General Hospital and Infirmary, Eloise, Mich.:

Trichinosis, A Major Health Problem: The method of spread of the disease, signs and symptoms, diagnostic methods, treatment and method of control are shown. Diagnostic tests and apparatus used in diagnostic methods are shown and living worms prepared from infected pork are demonstrated.

Lall G. Montgomery, Registry of Medical Technologists of the American Society of Clinical Pathologist, Muncie, Ind.:

Registry of Medical Technologists, American Society of Clinical Pathologists: The history, aims, requirements and development of the Registry of Medical Technologists are presented, and the part the registry has taken in the general development of medical technology is shown, together with a map showing distribution of registered medical technologists. A booklet of information and a list of schools of medical technology approved by the Council on Medical Education and Hospitals of the American Medical Association will be distributed.

Otto F. Kampmeier and Thomas N. Haviland, University of Illinois College of Medicine, Chicago:

Anatomic Specimens Preserved in Plastics: The exhibit includes cleared specimens, injected specimens, corrosion specimens, fragile wax models, dried preparations, transections of fetuses and adults, whole mounts of embryos, colored preparations, small dissections and brain sections mounted in plastics. The essential aim of the exhibit is to demonstrate the usefulness of plastics in the preservation of human material for study.

Section on Nervous and Mental Diseases

The representative to the Scientific Exhibit from the Section on Nervous and Mental Diseases is A. B. Baker, Minneapolis.

Walter L. Bruetsch and Max A. Bahr, Central State Hospital and Indiana University School of Medicine, Indianapolis:

Optic Nerve Atrophies: Sections and photomicrographs of various stages of atrophy of the optic nerves as they occur in cases of brain tumor, Schilder's disease, Pick's disease, multiple sclerosis, hydrocephalus, syphilis of the nervous system and optic atrophy caused by tryparsamide are presented. Therapeutic considerations, which vary with the etiology, are shown.

Henry R. Viets, Massachusetts General Hospital, Boston:

A Pictorial History of Myasthenia Gravis: Charts and photographs show the history of the knowledge of myasthenia gravis from the first description in the seventeenth century to the present time, with particular emphasis on the advances made in the last twelve years since the advent of neostigmine therapy.

Wallace B. Hamby, Buffalo General Hospital, Buffalo.

Subarachnoid Hemorrhage of Aneurysmal Origin. Review of 130 Cases: A series of 130 cases is shown, with sufficient basic material to make the information attractive to those not previously informed on the topic. Data of chief interest concern the outcome of these cases.

Mary E. O'Sullivan, Bellevue Hospital, New York:

Migraine Is Curable: The result of a twelve year study includes (*a*) a therapeutic survey with the method and the results of twenty-five different drugs in the treatment of 932 migraine patients; (*b*) a symptom survey in relation to type of medication which cures migraine; (*c*) photomicrographs of the capillaries during the migraine and nonmigrainous periods.

Randolph Leigh Jr. and Hugh Paige Newhill, University of Virginia College of Medicine, Charlottesville:

Epilepsy in Virginia: Incidence and distribution of epilepsy in Virginia is shown. Patients treated in an eighteen month period through the Anti-Convulsive Clinic of the Department of Neurology and Psychiatry of the University of Virginia Hospital with referring agencies. Examples of electroencephalograms of main types of epilepsy treated are included.

H. S. Rubinstein, Sinai Hospital, Alfred Ullman Laboratory for Neuro-Psychiatric Research, Baltimore, and C. L. Davis, University of Maryland School of Medicine, Baltimore:

Stereoscopic Atlas of Neuroanatomy: Stereoscopic photographic plates depict the embryology, gross structure and internal structure of the human brain dissected by an original method to disclose functional fiber systems. These plates are observed by means of the stereoscope, thus allowing a three dimensional picture of sequential stages of dissection. Each plate is accompanied with a labeled drawing which serves as an aid in orientation.

Rudolph Jaeger and William Whitley Jr., Jefferson Medical College and Hospital, Philadelphia:

Specimen of First Successfully Removed Brain Tumor: Specimen of a brain tumor (meningioma) removed by W. W. Keene in 1888 at Jefferson Hospital is exhibited. The tumor removed at operation, with the brain of the patient, obtained at necropsy thirty years later, which shows the defect created by removal of the growth, is demonstrated. This is of historical value as the first intracranial tumor to be successfully removed in the entire world.

Ernest A. Spiegel, Mona Spiegel-Adolf, Henry T. Wycis and Morton Marks, Temple University Medical School, Philadelphia:

Cerebral Concussion: It has been attempted on clinical as well as experimental material to elucidate the mechanism of cerebral concussion by various physical and physicochemical measurements, such as studies of the impedance of the brain, determination of the convulsive reactivity, electroencephalography, spectrophotometry of the cerebrospinal fluid in ultraviolet light and enzyme studies. Histopathologic and electroencephalographic changes in subcortical areas and injuries to the cell surfaces in the central nervous system as well as to intracellular structures will be demonstrated (appearance of nucleic acid compounds and related enzymes in the cerebrospinal fluid).

Section on Dermatology and Syphilology

The representative to the Scientific Exhibit from the Section on Dermatology and Syphilology is Francis W. Lynch, St. Paul.

J. K. Howles and William Branks Stewart, Louisiana State University School of Medicine, New Orleans:

Cutaneous Granulomas: The exhibit contains moulages, colored drawings, paintings, colored histopathologic photographs as well as descriptive charts of the cutaneous granulomas. Some of the rare granulomas are shown as well as the common varieties. An effort is made to facilitate differentiation of these granulomas.

Stephen Rothman and Adelaide M. Smiljanic, University of Chicago Clinics, Chicago, and Alfred W. Weitkamp, Standard Oil Company, Indiana:

Spontaneous Cure of Ringworm of the Scalp in Puberty: Changes are demonstrated in the composition of sebaceous gland secretion which occur in puberty and which are responsible for the spontaneous cure in puberty of ringworm of the scalp and for the immunity of adults. The fungicidal action of adult hair fat is shown with explanatory remarks on the technic of the fungicidal testing together with the tracing of the fungicidal activity by fractionation of the hair fat. It is concluded that the fungicidal activity is dependent on the presence in the sebum of highly fungicidal free fatty acids, the concentration of which is more than six times higher on adults' than on children's scalps.

G. H. Faget, P. T. Erickson and Sister Hilary Ross, U. S. Marine Hospital, Carville, La.:

Chemotherapy of Leprosy: Photographs of patients before and after treatment with sulfone drugs, promin, diasone and promizole are shown. The exhibit clearly demonstrates the suppressive action of the sulfones even in far advanced lepromatous disease of the worst prognosis. Less advanced cases become arrested more rapidly. All the lesions of leprosy respond more or less slowly to the therapeutic action of the sulfones. Improvement is progressive without relapses, so that the sulfones appear to be chemotherapeutic agents for leprosy. Histopathologic changes produced by the sulfones are also shown. The encouraging effects of streptomycin (used for a relatively short time) on leprous lesions are also demonstrated.

Leon Goldman, Department of Dermatology and Syphilology, and Waldo Younker, Kettering Laboratory of Applied Physiology, University of Cincinnati College of Medicine, Cincinnati:

Clinical Microscopy of the Surface of the Skin. Anatomy, physiology and biophysics in relationship to cutaneous optics are reviewed. Various types of apparatus for examination of the skin are shown, from simple magnifiers to new developments of skin microscopes. Types of illumination necessary for different technics of examination of the skin surface and skin capillaries are depicted. These technics include also fluorescent and infra-red microscopy. Brief mention is made of contrast phase microscopy in relationship to dermatology. Photomicrographs illustrating studies of various cutaneous conditions are exhibited, and an outline is given of some disorders in which cutaneous microscopy has been of value.

Wilbert Sachs and Perry M. Sachs, Skin and Cancer Hospital, New York:

Cutaneous Malignant Growths: Clinical and microscopic pictures of the different types of malignant growths of the skin are shown, together with series of microscopic photographs of anoplastic epithelioma.

John G. Downing and Bernard Appel, Tufts College Medical School, Boston:

Dermatoses Due to Leather: A graphic survey of the historical evolution of the process of manufacturing leather, illustrating the hazards that produce industrial dermatoses, with examples of actual cases, is exhibited.

Edward D. DeLamater, Mayo Clinic, Rochester, Minn.:

Dermatomycoses: Clinical Types and Variations in Their Causative Fungi: A pictorial demonstration of the clinical types of dermatomycosis caused by two distinct fungi, Microsporum canis and Trichophyton (Gypseum) mentagrophytes is shown. The variations and mutations of these fungi which occur spontaneously or can be induced by various means are demonstrated graphically in color. Moulages of certain of the more striking and unusual clinical types of disease are also included. The exhibit presents the types of variation, both clinical and mycologic, which have caused confusion in the field.

J. B. Howell, Bedford Shelmire and Gilmore Brau, Southwestern Medical College, Dallas, Texas:

Use of Interstitial Radium Needle Therapy for Cancer of the Skin: Photographs and charts depict the indications and usefulness of radium needles in the treatment of cancer of the skin in certain localities, especially areas offering obstacles to treatment by surgery or roentgen rays. Drawings demonstrate the needles used, the technic of implantation, the arrangement of the needles in particular patterns for adaptation to certain sites and the method of calculating the dose the lesions receive.

Paul E. Bechet, Elizabeth, N. J.:

Synopsis of the More Important Achievements of American Dermatology: Charts present biographic data and the more important contributions to medical literature of twenty-five leading American dermatologists, with complete bibliography and photographs. Original autographed letters and other memorabilia are also presented. An illustrated pamphlet of twenty-seven pages containing all the data in the exhibit will be distributed to visitors on request, as well as detailed biographies of many of the men mentioned.

Section on Preventive and Industrial Medicine and Public Health

The representative to the Scientific Exhibit from the Section on Preventive and Industrial Medicine and Public Health is Paul A. Davis, Akron, Ohio.

Bruno Gebhard, Cleveland Health Museum, Cleveland:

One Hundred Years of Lay Health Education: The role of the medical profession in lay health education during the last hundred years is presented. Samples are taken mainly from the Western Reserve, particularly Cleveland. Pamphlets, posters, journals, books and photographs are arranged chronologically, including material from the first decade of the Cleveland Health Museum.

Carl F. Jordan and I. H. Borts, Iowa State Department of Health, Des Moines and Iowa City:

Brucellosis: The reported occurrence of brucellosis in the forty-eight states from 1930 to 1946 is presented. Attention is directed to the three causative brucella organisms, with special emphasis on the caprine strain (Brucella melitensis) recently recognized as being endemic in Iowa and other Midwestern states. Means of conveyance, population groups concerned and survey findings are portrayed. Clinical and laboratory findings, therapeutic methods and chronic brucellosis received careful consideration. Literature will be available for distribution.

Cleveland J. White, Loyola University School of Medicine, Chicago:

Diseases of the Nails: Charts, posters, drawings and moulages of various nail syndromes are shown. Especial reference is made to dermatologic syndromes, with emphasis on those occurring in the various occupations.

Charles Walter Clarke and John W. Ferree, American Social Hygiene Association, New York:

Prevention of Venereal Diseases: A rounded concept of prevention of syphilis and gonorrhea including medical, social and educational aspects is presented. The exhibit points out that the "find 'em and treat 'em" plan is not enough and emphasizes the need to deal with sexual promiscuity, which is the usual method of spread of infection. The places of chemical, mechanical and oral prophylaxis, therapeutic disinfection and congenital syphilis by antepartum treatment of the mother are shown. An actual epidemiologic investigation is presented, with an indication of what might have been done at various points to prevent the transmission of syphilis or gonorrhea.

Elmer H. Loughlin, Samuel H. Spitz and Richard H. Bennett, Long Island College Hospital, Brooklyn:

Cosmopolitan Intestinal Parasitism: The epidemiology, pathogenesis and diagnosis of the common helminthic and protozoal infections encountered in the United States is presented. Transparencies portray these features in the epidemiology, pathogenesis and development of the parasites from ova to mature worms in the case of helminths and cystic or trophozoite phases of pathogenic protozoa.

J. Lynn Mahaffey, New Jersey State Department of Health, Trenton, N. J.:

The Health Department and the Physician—A Working Partnership: Illustration of some of the many phases of New Jersey's public health program in which the health departments and the practicing physicians work together for a common end—improved health for the state.

J. S. Felton, Health Department, Monsanto Chemical Company, Clinton Laboratories, Knoxville, Tenn.:

Health Education in Industry: Specific objects employed in health education in industry and methods of integrating such objects in changing the health behavior of the atomic worker.

A. H. Whittaker, Wayne University School of Occupational Health, Detroit:

The Historical Background of Occupational Diseases: The exhibit presents the early knowledge of occupational health by means of the earliest writings on the subject, the earliest printed editions and many rare volumes. The presentation is supplemented by portraits of Ramazzini, Agricola, Diemberbroeck and others, and by books and pamphlets including Statius (1485 edition), Aristotle (Aldine edition 1495), Hippocrates, Plinius Secundus, the Bible, Lucretius, Agricola, Diemberbroeck, Paracelsus: the first complete contribution, Ellenbog: the first pamphlet, Ramazzini: the first complete study, numerous editions, writers of the Renaissance, novelists dealing with social conditions such as Dickens and Zola, the American colonies, writers of the late nineteenth century, writers of the early twentieth century, Sir Humphry Davy and Mines, English and German and French writers from 1860, the period introduced by Alice Hamilton, Kober and Hayhurst, publications of the United States Public Health Service dealing with occupational health, modern publications dealing with occupational health.

R. R. Sayers, Bureau of Mines, Washington, D. C., and H. H. Schrenk, Bureau of Mines, Pittsburgh:

Modern Welfare Facilities in Mining Communities: Photographs of modern welfare facilities such as houses, schools, club houses, playgrounds, change houses and hospitals in various metal and coal mining communities are shown.

J. G. Townsend, Industrial Hygiene Division, United States Public Health Service, Washington, D. C.:

Progress in Industrial Hygiene: Progress is shown in the two major activities of the Industrial Hygiene Division, U. S. Public Health Service, investigations of hazardous industries leeading to the control of occupational diseases, and growth of industrial hygiene practice through the establishment of industrial hygiene units in states and localities.

H. L. Mantz and M. L. Furculow, U. S. Public Health Service, Kansas City, Mo., and E. J. Gillespie, Ira Lewis and L. B. Edwards, U. S. Public Health Service, Bethesda, Md.:

Pulmonary Lesions Associated with Sensitivity to Histoplasmin: A demonstration of chest radiographic findings correlated with the histoplasmin skin test. In the last few years the correlation between calcification in the chest and histoplasmin sensitivity has been established. Films demonstrating parenchymal infiltrates which in many cases progress to calcification and which are associated with coincident conversion in histoplasmin sensitivity are shown.

F. J. Weber and H. F. A. Long, Tuberculosis Control Division, U. S. Public Health Service, Washington, D. C.:

Control of Tuberculosis: The exhibit shows certain aspects of diagnosis, prognosis and treatment of tuberculosis.

J. R. Heller Jr., Eugene A. Gillis, Max R. Kiesselbach and C. Judson Hardy, Venereal Disease Division, U. S. Public Health Service, Washington, D. C.:

Aids to the Private Physician in the Management of Venereal Disease: The exhibit shows the newer treatment methods for syphilis and gonorrhea. Reprints and pamphlets of interest to physicians will be available.

C. W. Emmons, Joseph A. Bell and Byron J. Olson, National Institute of Health, U. S. Public Health Service, Bethesda, Md.:

Histoplasmosis: The exhibit shows the fungus Histoplasma capsulatum and the pathology in man and animals, methods of diagnosis and natural history of the disease it causes.

Roy Hertz, National Cancer Institute, U. S. Public Health Service, Bethesda, Md.:

Hormonal Control of Tissue Growth; Normal and Abnormal: A graphic presentation of the tissue growth effects induced by administration of gonadal and pituitary hormones; the reciprocal antagonism between various steroid hormones in relation to tissue growth; vitamin-hormone interrelationships; the application of these phenomena to hormonal therapy of cancer of the prostate.

R. J. Huebner, W. L. Jellison and Morris Greenberg, National Institute of Health, U. S. Public Health Service, Bethesda, Md., and the City of New York Department of Health, New York:

Rickettsialpox: The exhibit shows clinical characteristics, etiology and epidemiologic factors such as the vector and the reservoir and some of the environmental conditions responsible for the spread of the disease.

Section on Urology

The representative to the Scientific Exhibit from the Section on Urology is John H. Morrissey, New York.

Roger W. Barnes, R. Theodore Bergman and D. S. Rausten, College of Medical Evangelists, School of Medicine, Los Angeles:

Undergraduate Urologic Instruction: Specimens, photomicrographs, moulages and other material used in the instruction of medical students in urologic diagnosis are shown. The moulages consist of normal and pathologic conditions of the prostate, as felt by rectal palpation. Photomicrograph and specimens accompany these models.

Robert H. Herbst and James W. Merricks, Presbyterian Hospital and University of Illinois College of Medicine, Chicago:

Transurethral Drainage of Seminal Vesicles: The exhibit shows cleared postmortem specimens illustrating relations of seminal vesicles to prostate, bladder and ureters from normal and diseased persons; photographs of seminal vesiculograms of the normal and pathologic changes in these organs; charts and drawings including some brief case histories depicting the management of 350 patients with end results up to ten years, many of which were originally classified as chronic prostatitis.

C. M. Simpson, E. O. Bradfield and J. R. Kilman, Scott and White Hospital, Temple, Texas:

Plastic Surgery for Hydronephrosis: Moulages, roentgenograms and specimens show the various types of pathologic conditions producing hydronephrosis and various methods of their correction by surgical means.

Ernest M. Watson, Hans R. Sauer and Eugene M. Burke, Roswell Park Memorial Institute and University of Buffalo School of Medicine, Buffalo:

Tumors of the Testicle: A review of over 200 testicular tumors observed over a twenty-five year period is presented. The tumors have been classified according to the criteria adopted by the Army Institute of Pathology. An attempt is made to correlate the histologic findings with the prognosis and the response to irradiation. The signs, symptoms, diagnosis and clinical course of the disease is here discussed, together with the end results obtained.

GEORGE F. CAHILL and MEYER M. MELICOW, Squier Urological Clinic, Presbyterian Hospital, New York:

Tumors of the Adrenal Gland: This exhibit deals with tumors of the adrenal gland. From correlated clinical and pathologic studies, these tumors are classified. Four main groups of cortical tumors are discussed: (1) asymptomatic, (2) adrenogenital, (3) Cushing syndrome, (4) mixed adrenogenital and Cushing. The medullary tumors are discussed and illustrated. Studies on phenochromocytomas are shown and illustrate (1) the specificity of eyeground change, (2) the specificity of the antiepinephrine action of benzodioxane compounds and (3) the use of histamine as an epinephrine stimulant. The value of perirenal air insufflation as a localizer of adrenal tumors is demonstrated.

HOWARD I. SUBY and FULLER ALBRIGHT, Massachusetts General Hospital, Boston:

Mechanical Problems in the Retrograde Dissolution of Urinary Stones with Solution G: Glass models of kidneys containing stones show various surgical and cystoscopic methods used in dissolution of these stones with solution G. The exhibit also introduces a new automatic irrigator which works by electricity. Charts, drawings and roentgenograms show mechanical problems encountered in stone dissolution and how they may be managed.

VICTOR F. MARSHALL, WILLET F. WHITMORE JR., MORRIS SCHMITTMAN, MAUS STEARNS and ARCHIE L. DEAN JR., Cornell University Medical College, New York:

Pyelographic Results of Ureterointestinal Anastomosis by the Coffey I Method: A demonstration by means of photographs of roentgenograms of results obtained after ureterointestinal anastomosis, compared with preoperative films. Several mounted specimens obtained at autopsy will show further correlations. Early and late pyelographic results will be compared. A résumé of approximately 100 consecutive cases will accompany the presentation and a brief set of conclusions.

F. C. HENDRICKSON, Canton, Ohio:

A Visualizing Lithotrite: The new lithotrite has the following features incorporated in its design: (*a*) excellent vision between the jaws close to the field of operation, (*b*) adequate flow of water, (*c*) strength of jaws sufficient to crush stones up to 2 cm. in diameter. The method of using the lithotrite will be demonstrated. Samples of all other well known types of lithotrites will be at hand for comparison and for demonstration of the evolution of the instrument.

HENRY SANGREE, HOWARD FRETZ, JOHN HUGHES and NORTON GROTH, University of Pennsylvania, Philadelphia:

Fertility in the Male—Surgical and Clinical Problems: A statistical survey of 300 consecutive cases of husbands of a barren marriage, whose wives had a previous examination by the gynecologist or the obstetrician. A report of seven epididymovasostomy operations with one successful result. Photographs of the successful completion of four Ombredanne operations for penile hypospadias. Photomicrographs in color of testicular biopsies from men showing azoospermia and oligozoospermia and the improvement under treatment of spermatogenesis shown by subsequent biopsies of the seminiferous tubules. A report of endocrine disorders causing infertility, particularly thyroid and pituitary gland disturbances, which occurred in 21 per cent of our series. Azoospermia was present in 12 per cent of men examined.

SEYMOUR F. WILHELM, Beth Israel Hospital, New York:

Diagnosis and Treatment of Diseases of the Adrenal Glands: The value of laminography, or tomography, in the roentgenographic delineation of the normal and the enlarged adrenal gland is demonstrated by a comparison of simple films with laminograms made following perirenal insufflation. Over seventy insufflations have so far been done on 46 patients suspected of suffering from disease of the adrenal gland, without serious sequelae. The diagnosis and surgical treatment of female pseudohermaphroditism, virilism and Cushing syndrome is illustrated by photographs, roentgenograms and transparencies of gross and microscopic slides.

Section on Orthopedic Surgery

The representative to the Scientific Exhibit from the Section on Orthopedic Surgery is David M. Bosworth, New York.

LEONARD F. BUSH, C. ZENT GARBER, WILLIAM H. VON LACKUM and JAMES P. MILLER, New York Orthopedic Hospital, New York:

Bone Bank and Homogenous Bone Grafts: Sources, use, storing preservation of bone are outlined. Results of experimental work on rabbits in grafting of homogenous and autogenous bone are shown, together with clinical results in the use of homogenous bone in the human being and comparative human autogenous and homogenous grafts.

ARTHUR C. STIRLING, Jackson Clinic, Madison, Wis.:

Intervertebral Disk Herniation: The exhibit is prepared with special reference to the protruding nucleus pulposus in the lumbar region, with the causes, symptoms, diagnostic tests, and the methods of treatment, conservative and surgical.

JOSEPH S. BARR, JOHN A. REIDY and JAMES R. LINGLEY, Massachusetts General Hospital, Boston, and EDWARD GALL, Bethesda Hospital, Cincinnati:

The Control of Epiphysial Growth by Roentgen Irradiation: The result of roentgen irradiation on growing epiphyses of experimental animals is demonstrated. This experimental work, which has been in progress for a number of years, shows that roentgen rays have a highly selective effect on growing epiphysial cartilage cells. The danger inherent in the therapeutic clinical use of roentgen irradiation on or near the joints of growing children is obvious.

STEPHEN S. HUDACK and CLAY RAY MURRAY, Columbia University College of Physicians and Surgeons, New York:

Matrix Variation in Bone Regeneration: Tissue reaction in relation to the type of matrix, artificial and otherwise, and the donor elements involved in the filling of bone defects and deficiencies are demonstrated. Wherever possible the matrix influence is correlated to bone healing.

J. E. M. THOMSON, C. F. FERCIOT, W. W. BARTELS, F. S. WEBSTER and F. P. STONE, Orthopaedic Clinic, Lincoln, Neb.:

Use of Reverse Dennis-Browne Splints in Congenital Pes Calcaneovalgus: Congenital pes calcaneovalgus is more common than generally appreciated. Photographs and roentgenograms together with models illustrate the diagnostic points and show the rationale of treatment with reverse Dennis-Browne splints and also indicate the type of case for which they are applicable.

FRANCIS M. POTTENGER JR., Francis M. Pottenger Jr. Hospital, Monrovia, Calif., and JOSEPH C. RISSER, Orthopaedic Hospital, Los Angeles:

Studies in Epiphysitis: Roentgenograms show various forms of epiphysitis and fragmentation of bones as they appear, beginning with those noted in the tarsal and metatarsal region at birth, the knees, the elbows and the spine. Posters describe the sequence of development and healing of the various epiphysitides and suggested methods of prevention. Illustrations of comparable conditions produced experimentally in the cat and rat are shown.

JAMES A. DICKSON, Cleveland Clinic, Cleveland:

Geometric Osteotomy for Ununited Fracture of Neck of Femur: A new operation for the treatment of ununited fractures of the neck of the femur is presented, combining the advantages of the osteotomy and the bone graft. The rotation of the head and upper end of the femur is accurately controlled by internal fixation. The geometric osteotomy restores the femoral neck, overcomes shortening and equalizes the length of the legs. The use of a cast is eliminated. Technic and end results are also shown.

BRADLEY L. COLEY and N. L. HIGINBOTHAM, Memorial Hospital, New York:

The Differential Diagnosis of Bone Tumors: Photographic reproductions of x-ray films mounted in pairs. Each pair shows similar appearing lesions with different diagnoses. The points in the differential diagnosis are enumerated in a printed paragraph between the members of each pair. All phases of malignant and benign bone tumors are thereby covered in the sixty plates presented.

Section on Gastro-Enterology and Proctology

The representative to the Scientific Exhibit from the Section on Gastro-Enterology and Proctology is Donovan C. Browne, New Orleans.

HENRY A. RAFSKY, MICHAEL WEINGARTEN, CHARLES I. KRIEGER and WILLIAM F. HERZIG, Lenox Hill and Beth Israel Hospitals, New York:

Syphilis of the Stomach: The historical aspects of syphilis of the stomach, the incidence, symptoms, physical and laboratory findings and gastroscopic findings in the cases which have been reported in the literature are shown. An additional case with gastroscopic findings is reported. In this case intragastric photographs in color were taken in conjunction with the gastroscopies which were made at various stages of treatment. These photographs and x-ray films illustrate the lesions before and after treatment. Various therapeutic aspects of syphilis of the stomach and nonsyphilitic gastric lesions in patients who have syphilis will be demonstrated.

JOSEPH FELSEN and WILLIAM WOLARSKY, Bronx Hospital, Bronx, New York:

Acute and Chronic Bacillary Dysentery: Exhibit dealing with acute and chronic bacillary dysentery with particular reference to World War II. Studies on returning veterans and associated personnel in training and combat areas and follow-up studies on the incidence of regional ileitis and chronic ulcerative colitis are shown. General studies on the new epidemiologic, bacteriologic, clinical and therapeutic aspects are included, with the status of prophylactic vaccination. Teaching sets for physicians and public health workers will be presented.

CECIL O. PATTERSON, MILFORD O. ROUSE, JOHN S. BAGWELL and LEWIS WATERS, Southwestern Medical College, Dallas, Texas:

The Injection Treatment of Esophageal Varices: This exhibit shows by large drawings the anatomic bases of esophageal varices; it demonstrates their treatment diagrammatically; it shows roentgen ray results in several selected cases and gives typical patient histories and summary of work to date.

WILLIAM P. CHAPMAN, CHESTER M. JONES, FRANCIS D. MOORE and AUDREY DENNISON, Massachusetts General Hospital, Boston:

Gastrointestinal Motility: Studies of gastrointestinal motility have been made during resting conditions and in response to drugs and surgery of the autonomic nervous system. A four-channeled tube was employed connecting each of four balloons to separate water manometers. An attempt has been made to evaluate changes in tone and what is thought to represent mixing contractions and propulsive activity. The subjects represent both healthy individuals and patients with symptoms of the gastrointestinal tract, vagotomized patients and hypertensive patients following thoracolumbar ganglionectomy. The effects of drugs with cholinergic and spastic action, antispasmodics and procaine block of sympathetic ganglions have been noted.

ROBERT TURELL, New York:

Tattooing with Mercury Sulfide for Intractable Anogenital Pruritus: Clinical and histologic studies of tattooed pruritic skin are presented together with the therapeutic results obtained in a series of 93 cases, with statistical analysis. Neural studies to explain the modus operandi of this form of treatment are presented graphically. A new instrument for therapeutic tattooing is described.

LESTER M. MORRISON, College of Medical Evangelists, Los Angeles County General Hospital, Los Angeles:

Alcohol and the Liver—Effects and Treatment: The results of eight years' investigation of the clinical and pathologic changes in the liver resulting from an abnormal intake of ethyl alcohol are presented. Histologic changes in the liver, as secured by punch biopsy before and after treatment, are shown. The results of treatment by various new lipotropic agents such as a new choline carbonate, a new liver extract and high protein diet, are shown. The various forms and stages of the liver damaged by alcohol are described with particular reference to therapy and prognosis.

EDWIN BOROS, New York City Cancer Hospital, New York:

A New Flexible Esophagogastroscope: A metal spiral tip is employed in this instrument enabling ease and safety in introduction with no more mechanical difficulty than that required in the passage of an ordinary stomach tube. By means of a metallic rod the tube is straightened after it is introduced, so that an open passage is provided for visualization and instrumentation.

MANFRED KRAEMER and LEO H. SIEGEL, Presbyterian Hospital, Newark, N. J.:

Synthetic Resin, a New Antacid for Treating Peptic Ulcer: Various antacids that have been used in treating peptic ulcer are shown, and a comparison of their neutralizing effect on gastric juice with that of phenol formaldehyde type resins; a summary of clinical findings with the use of resins on a number of patients with peptic ulcer are included, together with a history of the development of resins as antacids.

HAROLD LINCOLN THOMPSON, Los Angeles:

Melena: A Study of Underlying Causes: Charts, diagrams and roentgenograms are presented illustrating cases of gastrointestinal bleeding wherein the predominant symptom was melena, as compiled from the records of the Los Angeles General Hospital.

LEO L. HARDT, JOHN S. COULTER and LEONARD P. BRODT, Loyola University School of Medicine, Northwestern Medical School, and Cook County Post-Graduate School, Chicago:

Clinical and Local Effects of Antacids and Physical Therapy as Shown Gastroscopically: Comparative study of objective findings produced by various antacids and physical therapy in patients with gastric lesions as seen by grastroscopy and x-ray examination. The changes noted in the mucosa were also compared with the gastric secretory response. Gastric acidity curves, kodachrome pictures of the gastric mucosa and tables comparing the response to various antacids are shown. The Hardt and Schindler gastroscopes are demonstrated.

Section on Radiology

The representative to the Scientific Exhibit from the Section on Radiology is S. W. Donaldson, Ann Arbor, Mich.

LEWIS E. ETTER, Pinewood Farm, Warrendale, Pa.:

Postwar Views of Röntgen's Laboratory: An Exhibit of Photographs, Books, Correspondence and Papers Pertaining to Röntgen and the Discovery of X-Rays: Photographs with captions, showing the present state of the University of Würzburg and Röntgen's laboratory. Views of original tubes, films and other mementoes and views of Röntgen's birthplace and burial place are shown. A collection of previously unpublished correspondence between Röntgen and Professor P. Lenard of Heidelberg, who claims precedence in the discovery (these letters disprove his contentions), are included, with recent (1944) books of Lenard's detailing his claims. Data showing the way discovery of x-rays came about are presented.

J. GERSHON-COHEN and PHILIP J. HODES, Philadelphia:

Breast Cancer Roentgenology: The methods and technics for examining the breast roentgenographically are presented. The wide range of x-ray films of the normal breast are shown and compared with the various groups of abnormal conditions of the breast necessary to be acquainted with for differential diagnosis of breast cancer. The corresponding photomicrographs of biopsy and tissue material are part of the exhibit.

MAURICE LENZ, Columbia University, New York:

Radiocurability of Cancer: Curability of cancer by radiotherapy (roentgen ray, radium, radioactive substances) depends on the natural growth characteristics, extent, location, microscopic structure and inherent radiosensitivity of the cancer and on the radioresistance of the irradiated normal tissues, tolerance of the patient, dosage of radiation reaching the tumor and technic of radiotherapy. The relationship of these various factors to the five year freedom from clinical evidence of cancer is illustrated on transparencies.

LEO G. RIGLER, THOMAS B. MERNER and ROBERT SHAPIRO, University Hospital, University of Minnesota, Minneapolis:

Carcinoma of the Lung, Roentgen Diagnosis: Drawings and roentgenograms illustrate the multiformity of roentgen findings in bronchogenic tumors. Cases illustrate (1) the early signs of bronchogenic carcinoma, especially segmental, lobar or unilateral emphysema, (2) the other evidences of obstruction such as atelectasis and bronchiectasis, (3) the delineation and localization of the bronchial tumor by bronchography and (4) the usefulness of body section roentgenography (planigraphy) as a supplementary and substitute procedure for the delineation and localization of bronchial tumors.

WILLIAM E. HOWES, SIGFRIED W. WESTING, HERMAN BOLKER, RICHARD SHAPIRO and JOSEPH SKAPIER, Brooklyn Cancer Institute, Brooklyn:

Hodgkin's Disease: Charts show the historical and pathologic classification of clinical types, including locations of spread; statistical record of cases treated at Brooklyn Cancer Institute, methods of treatment and longevity; photomicrographs of various types and postradiation, and roentgenograms of interesting organoid involvement before and after radiation therapy.

JAMES F. KELLY, D. ARNOLD DOWELL, JOHN E. DOWNING and JAMES F. KELLY JR., Creighton University School of Medicine, Omaha:

Roentgen Rays in Prevention and Treatment of Infections—A Fifty Year Review: Considerable experimental and clinical evidence has accumulated in the past fifty years on the use of roentgen rays in prevention and treatment of infections. The old concept of heavy dosage, such as used in treating malignant conditions, has been universally discarded in favor of lower voltage and lower dose therapy in treating infections. It is now recognized that therapy of inflammations and the therapy of tumors are two entirely different procedures. Observations of many workers who assisted in establishing these facts will be presented. Roentgen rays in infections have definitely passed from the theoretical to the practical stage.

MARCY L. SUSSMAN and HAROLD NEUHOF, Mount Sinai Hospital, New York:

Angiography in the Differential Diagnosis of Intrathoracic Neoplasms: Roentgenograms and photographs of specimens illustrate the displacement, distortion and occlusion of superior vena cava and pulmonary vessels which occur in intrathoracic neoplasms.

JAMES E. LOFSTROM, St. Mary's Hospital, Wayne University College of Medicine, Detroit, and DONALD A. KOCH and RICHARD C. SCHNEIDER, Detroit:

Penetrating Cranial Wounds: A collection of roentgenograms demonstrate various types of penetrating wounds of the cranium, together with operative treatment. Pneumoencephalographic findings are presented which illustrate the early hydrodynamic compensations that occur following loss of cerebral tissue. Brain abscesses, cranio-orbital wounds and cerebral wounds are separately presented and some of the problems associated are demonstrated. Pneumoencephalographic findings in various stages of progress of these cases are shown, with color photographs of patients, gross specimens and correlated material.

VINCENT W. ARCHER, GEORGE COOPER JR. and NORMAN ADAIR, University of Virginia School of Medicine, University, Va.:

Clinical Manifestations of Disease Modified or Masked by Chemotherapy: Roentgenograms of various disease conditions are presented in which the symptomatology was either masked or modified by chemotherapy so that the conditions were not recognizable clinically. Empyema, lung abscess, necrotic mastoiditis, perirenal abscess, pelvic abscess following rupture of the bladder and osteomyelitis are shown. This exhibit emphasizes the increasing responsibility of the radiologist in diagnosis since the advent of specific antibiotics.

B. P. WIDMANN, HERMAN OSTRUM and RUSSELL MILLER, Philadelphia General Hospital, Philadelphia:

Problems in the Roentgenologic Differential Diagnosis of Pulmonary Lesions: The exhibit includes (1) malignant lung tumors simulating tuberculosis, abscess, pneumonia; (2) mediastinal tumors: (*a*) anterior, (*b*) posterior; (3) pulmonary cysts: (*a*) congenital, (*b*) acquired, (*c*) parasitic; (4) isolated tumors in lung simulating metastatic malignancy: (*a*) tuberculomas, (*b*) plasmocytoma, (*c*) Hodgkin's, (*d*) sarcoidosis; (5) lymphoblastomas: (*a*) Hodgkin's, (*b*) giant follicular lymphoadenopathy; (*c*) leukosarcomas; (*d*) reticulum cell sarcoma; (*e*) lymphatic leukemia; (6) pseudomediastinal neoplasm: (*a*) cold abscess, (*b*) aneurysm (aortic), (*c*) megaesophagus, (*d*) cardiac aneurysm, (*e*) lymphatic leukemia; (7) miliary nodulations: (*a*) metastatic malignancy, (*b*) lymphogenic malignant spread, (*c*) hemosiderofibrosis in cardiac decompensation.

LEE A. HADLEY, Syracuse, N. Y.:

Cervical Spine and Shoulder Studies: Exhibit of roentgenograms showing (1) relative positions of the bones of the shoulder girdle in adduction and abduction (*a*) normally, (*b*) acute trauma, (*c*) follow-up; (2) relative positions of the bones of the cervical spine in flexion and extension (*a*) normally, (*b*) acute trauma, (*c*) follow-up, (*d*) with degenerative and arthritic changes and (*e*) with some congenital anomalies; (3) atlanto-occipital fusion; (4) occipital vertebra; (5) basilar impression; (6) foramen magnum encroachment; (7) ossiculum terminale; (8) agenesis of cervical pedicles; (9) spontaneous subluxation of the atlas.

Section on Anesthesiology

The representative to the Scientific Exhibit from the Section on Anesthesiology is Urban H. Eversole, Boston.

JOHN ADRIANI and DAVID A. DAVIS, Louisiana State University and Charity Hospital, New Orleans:

Physiologic Changes During Spinal Anesthesia: Various physiologic changes resulting from denervation produced by intrathecal injection of local anesthetic drugs in man are summarized. Emphasis is placed on changes in the circulatory system, respiratory system and blood. Effects on the viscera caused by spinal anesthesia on the autonomic nervous system are also stressed.

GEORGE J. THOMAS and PAUL A. SICA, University of Pittsburgh School of Medicine, and St. Francis Hospital, Pittsburgh:

Management of Spinal Analgesia with Intravenous Sympathomimetic Agent: Charts, diagrams and electrocardiograms illustrate the value of intravenous neosynephrin in the minute to minute control of blood pressure during spinal analgesia.

MEYER SAKLAD, PRISCILLA SELLMAN and ELIHU SAKLAD, Rhode Island Hospital, Providence, R. I.:

Intraspinal Segmental Anesthesia: Models, charts, descriptive material of anatomy, physiology and pharmacology show a method for the limitation of spinal anesthesia to definite segments of the cord and the advantages thereto.

JAMES C. MCCANN, St. Vincent Hospital, Worcester, Mass.:

Neurophysiology of Respiration under Pentothal and Other Anesthetic Agents: Abdominal quietude and muscle relaxation during surgical anesthesia depends on the state of the abdominal muscles as accessory muscles of respiration. Their state reflects the physiologic response of respiration to surgical trauma. With reference to this problem quantitative and pneumographic observations were made in 2,500 cases. 1. Quantitative studies show the rate of utilization of pentothal to unconsciousness; to loss of motor response and acceptable anesthesia. Analysis was made of possible factors bearing on utilization (age, weight, length and type of operation). 2. Pneumographic recordings deal with the pharmacologic effects of pentothal on respiration; with specific reflex respiratory response to trauma from the several neurologic segmental areas (cranial, cervical, thoracic, lumbar and sacral); with modifications of these responses by specific segmental block with procaine; with comparative pneumographic studies using spinal and ether and curare; with pneumographic observations on the integrated use of ancillary agents against specific reflexes. 3. Method of anesthesia (pentothal and local nerve block) presents data on safe fractionation of dosage; on pneumographic study of time factor to maximal effect; on reduction of utilization of pentothal by procaine nerve block; on rectus sheath block (transincisional) and anatomy of specific field blocks (intercostal, anterior splanchnic, pelvic, mesenteric and rectal).

Ralph M. Waters, O. S. Orth, F. J. Pohle, Donald R. Kindschi and Lucien E. Morris, University of Wisconsin Medical School, Madison, Wis.:

One Hundred Years of Chloroform: Certain historical data are presented such as early publications, equipment and models of inhalers. Some results are presented of a current reevaluation of chloroform both in the laboratory and in the operating room.

Donald E. Hale, W. James Gardner and Harold E. Harris, Cleveland Clinic, Cleveland:

Control of Bleeding During Operation by Induced Arterial Hypotension: The first result of blood letting on the general circulation is peripheral vasoconstriction. As the bleeding continues there then occurs a fall in blood pressure. Both of these factors may be used to reduce blood loss during surgical procedures. They can be brought into play by preoperative arterial puncture and blood letting followed by intra-arterial reinfusion of the removed blood at the close of the operation. This can best be accomplished by tying a cannula into the radial artery directed toward the heart and connecting this cannula to a pressurized system for the reception and reinjection of the blood. This procedure can be used to control massive bleeding such as may be encountered during the removal of an intracranial tumor or to control slight but troublesome bleeding such as that which hampers the otologist during a delicate fenestration operation. The procedure is safe because the arterial cannula, connected to a reservoir of the patient's blood, enables the operator to control the pressure in the aorta at all times.

Section on General Practice of Medicine

The representative to the Scientific Exhibit from the Section on General Practice of Medicine is J. Craig Bowman, Upper Sandusky, Ohio.

H. Leonard Bolen, Fall River, Mass.:

The Blood Pattern in Malignancy: Photographs and photomicrographs show the normal and malignant blood pattern. Charts show percentage of negative and positive cases and conditions yielding temporary cancer pattern; apparently cured carcinomas and a group of noncancer cases; group of proved cancer cases, together with histories of patients and technic of test.

Willis S. Knighton and Virginia Smith Boyce, Committee on Glaucoma, National Society for the Prevention of Blindness, New York:

The Physician's Part in Preventing Blindness from Glaucoma: Signs and symptoms of glaucoma recognizable during general physical check-up are shown, and information on testing technics is included.

Louis I. Dublin and Mortimer Spiegelman, Metropolitan Life Insurance Company, New York, and Roscoe G. Leland, Chicago:

Longevity and Mortality of Physicians: Charts show (*a*) American experience, derived from records of physicians furnished by the Bureau of Medical Economic Research of the American Medical Association. The current expectation of life of physicians is compared with that of the current general population. A detailed analysis is made of causes of death, according to age, among physicians; comparisons are made with corresponding data for the general population of the United States. A map is prepared showing the geographic variation of mortality among physicians within the United States. (*b*) British experience. The mortality of physicians is compared with that of other professions.

William Benham Snow, College of Physicians and Surgeons, New York:

A Program in Physical Medicine: The exhibit includes (1) the educational program at the College of Physicians and Surgeons, including training courses for therapists in occupational and physical therapy, and postgraduate instruction in physical medicine including fellowships under the Baruch grant, orientation to nurses and other groups; (2) research in physical medicine now going on under the Baruch grant; (3) physical and occupational therapy service and its operation at the Presbyterian Hospital, Vanderbilt Clinic and allied hospitals. Special attention is given to the cerebral palsy problem, posture and occupational therapy in the curative workshop and at bedside for improvement in body function.

H. L. Foss and Henry F. Hunt, George F. Geisinger Memorial Hospital, Danville, Pa.:

The Rural Medical Center under the Group Practice Plan: The development of a rural medical center and the various departments providing diagnostic facilities to physicians referring patients for problems in diagnosis and treatment is presented, together with the role that such a center plays as an educational institution: for (*a*) interns, (*b*) residents, (*c*) physicians of the surrounding areas, (*d*) nurses, (*e*) technicians. For the community as a whole it is shown how such a center may assist in safeguarding the public health by furnishing laboratory and hospital facilities and by instructing the layman in medical and public health problems. Basically the exhibit emphasizes what may be done by the coordination of professional effort in a medical center serving a far flung rural area.

Carl Reich, Lenox Hill Hospital, New York:

A Clinical Atlas of Sternal Bone Marrow: Diagrams and charts illustrate the various steps in performing a sternal puncture and processing the material. In addition there are twenty-five large kodachrome reproductions of various bone marrow pictures, with detailed descriptions covering the most important hematologic conditions.

A. W. Oughterson and G. W. Larimore, American Cancer Society, Inc., New York:

The Cancer Problem Today: A graphic and diagrammatic presentation of the cancer problem today is presented, with especial reference to the role of the general practitioner in the reduction of cancer morbidity and mortality.

Alexander S. Wiener, Office of the Chief Medical Examiner, New York City, and Jewish Hospital, Brooklyn:

Rhesus Blood Factors in Clinical and Legal Medicine: The exhibit covers the most important facts of the Rhesus factor field. The Rh-Hr blood types, their mechanism of heredity and racial distribution and their application in disputed parentage are shown. Tests for Rh sensitization: agglutination test, blocking test and conglutination test, and application in blood transfusion, pathogenesis of erythroblastosis and serologic diagnosis, are presented. Treatment of erythroblastosis by complete exchange transfusion is included.

Ella Best, American Nurses' Association, New York:

Nurses and Nursing: The exhibit consists of charts, graphs and other illustrative material showing the activities of the American Nurses' Association.

W. C. Colbert and L. W. Kibler, State Medical Association, Postgraduate Committee in Cancer, University Center, Memphis:

Postgraduate Medical Education: The exhibit includes two maps of Tennessee, one showing location of teaching and instruction centers for a two year program of extension medical postgraduate teaching in gynecology just completed; the second, the instruction program graphically portrayed for the two year cancer program recently opened. Charts will show the contributing agencies, committee of administration and résumé of the past ten years of postgraduate teaching in Tennessee.

C. C. Grey, O. L. Ostern, J. D. Ray, H. W. Schoening and L. Van Es, American Veterinary Medical Association, Chicago:

Swine Erysipelas: The exhibit shows the animals which may be infected with Erysipelothrix rhusiopathiae, the variety of manifestations of the infection, research findings and control methods and the known geographic distribution of the disease.

Lawrence J. Linck, National Society for Crippled Children and Adults, Chicago:

Services to the Handicapped: The exhibit includes pictures and slides, with descriptions illustrating health, welfare, education, recreation, rehabilitation and employment services for crippled and handicapped persons; special emphasis is placed on services for cerebral palsied children.

G. Foard McGinnes, The American National Red Cross, Washington, D. C.:

Blood Donor Service: The exhibit shows the role of the American Red Cross in meeting needs for blood and useful blood derivatives for civilian medicine.

MISCELLANEOUS EXHIBITS

Exhibits on various miscellaneous subjects are shown under this heading. They include a group of exhibits on diabetes together with the question and answer conference on diabetes, and the exhibits of the United States Army, United States Navy and the Veterans Administration.

Katharine R. Boucot, David A. Cooper and Russell Richardson, Philadelphia County Medical Society and Philadelphia Tuberculosis and Health Association, Philadelphia:

Philadelphia Diabetic Survey: Photofluorograms with abstracts of case histories on some of the significant cases uncovered during the survey of 3,167 diabetic patients during the year 1946. (Of the first 2,867 analyzed, the percentage of reinfection type tuberculosis was 8.3.)

Howard, F. Root, Elliott P. Joslin, Priscilla White, Alexander Marble, C. Cabell Bailey and Allen P. Joslin, George F. Baker Clinic, New England Deaconess Hospital, Boston, and Herbert H. Marks, Metropolitan Life Insurance Company, New York:

Diabetes Mellitus: New data are presented based on follow-up of patients to indicate the changing life expectancy in diabetes. Treatment of complications including retinopathy, pregnancy, acidosis and gangrene is discussed and information concerning experimental diabetes shown. The importance of early detection of diabetes is emphasized and demonstrated by laboratory methods.

Saul S. Samuels, Stuyvesant Polyclinic, New York:

Diabetic Gangrene: Photographs and kodachrome slides show classification of diabetic gangrene, indications for conservative treatment, methods of conservative treatment, indications for amputations, methods of amputations and value of penicillin and other drugs.

Hugh L. C. Wilkerson, Diabetes Section, United States Public Health Service, Joseph H. Barach and Frank N. Allan, American Diabetes Association, Boston:

Diabetes in the United States: The activities of the American Diabetes Association in helping physicians and patients to meet the problems of diabetes are presented. The results of the diabetes program of the United States Public Health Service are demonstrated, with statistics on the incidence of diabetes as revealed by the case finding study in Oxford, Mass.

Ranice W. Birch Davis, Association of Medical Illustrators, Johns Hopkins School of Medicine, Baltimore:

The Development of Medical Illustration: The exhibit shows the historical development of medical illustration from the earliest times. Emphasis is placed on its growth in America during the last hundred years and its present status and relation to medical illustration. Material consists of original drawings, enlarged photographic prints of old engravings, and ancient anatomic and medical illustrations, models and a brief description of the Association of Medical Illustrators.

S. J. McComb, Mayo Clinic, Rochester, Minn., Albert Levin and Anne Shiras, University of Pittsburgh, Pittsburgh:

Preparation of Photographs for Publication and Projection: The exhibit illustrates the requirements which should be met by photographs taken for publication. Successful illustrations in black and white and color are shown and their preparation is explained. Examples are also given of the right and wrong way to prepare charts, graphs and typewritten material for lantern slide demonstration. The exhibit will be attended at all times by a photographer qualified to answer questions about the materials, apparatus and methods used in the various fields of medical photography, with data collected by the Biological Photographic Association.

E. Fullerton Cook, United States Pharmacopeial Convention, Philadelphia:

The United States Pharmacopeia: The exhibit reviews briefly the history of the United States Pharmacopeia for the past hundred years but emphasizes the new Pharmacopeia, the Thirteenth Revision of which became official April 1, 1947. An indication of the international character of the Pharmacopeial Standards is presented.

Robert P. Fischelis, American Pharmaceutical Association, Washington, D. C.:

A Century of Progress in Drug Standardization: The exhibit illustrates the activities of the American Pharmaceutical Association in the evolution of unofficial and official standards for drugs since it was founded in 1852. Special emphasis is laid on the part played by the laboratory and other scientific facilities of the Association and its members in the establishment and revision of the National Formulary as one of the official compendia recognized under federal and state food, drug and cosmetic acts.

Meta R. Cobb, American Occupational Therapy Association, New York:

Occupational Therapy: The exhibit depicts the major functions of occupational therapy in the treatment of patients. Photographs and legends illustrate occupational therapy for morale, general fitness, to increase joint function, to compensate for residual handicaps, for mental illness, for unadjusted youth and the aged, for mental health and for prevocational training. A pictorial chart illustrates the relationship of the various medical adjuncts to the treatment relationship between doctor and patient.

Warren P. Morrill, American Hospital Association, Chicago:

Improving the Quality and Quantity of Hospital Care: This exhibit describes the major programs of the American Hospital Association which have for their purpose the improvement of the quality and quantity of hospital care in America. Accomplishments attained, current programs being conducted and national programs being developed will be graphically summarized.

Everett S. Elwood, National Board of Medical Examiners, Philadelphia:

National Board of Medical Examiners: The exhibit describes the work and progress of the National Board of Medical Examiners and includes graphic presentation of the results of its examinations.

Ada M. Hill, American Hearing Society, Washington, D. C.:

The Conservation of Hearing: Charts, posters, photographs and dioramas show the progress in the conservation of hearing program during the past century. Literature on hearing tests, lip reading, hearing aids, auditory training and the hard of hearing child and adult will be distributed.

Hart E. Van Riper, Morton A. Seidenfeld, Catherine Worthingham and Roland H. Berg, National Foundation for Infantile Paralysis, Inc., New York:

Infantile Paralysis: A graphic presentation of the diagnostic criteria of acute anterior poliomyelitis. Historical review of physical therapy in the treatment of the disease. The role of general hospitals in providing care for the poliomyelitis patient.

Maurice B. Visscher, A. B. Baker, R. Brown, John Adams, Alan Hemingway, R. Anthony and J. Elam, University of Minnesota, Minneapolis:

The Physiologic Problems of Bulbar Poliomyelitis: A graphic visualization of the physiologic problems in the management of bulbar poliomyelitis. Presentations will be made of the various categories of involvement and their specific therapeuses. Lectures on the principles involved and demonstrations of treatment procedures will be made at stated intervals during exhibit hours.

United States Army, Medical Department, Washington, D. C.

The Surgeon General presents a display of transparencies showing clinical and pathologic aspects of atomic warfare.

The Air Surgeon of the Army Air Forces presents graphically a résumé of various technics and displays certain instruments developed primarily to meet combat emergencies, which have been given to the general public to aid clinical medicine throughout the nation. The exhibit includes the technic of catheterizing the right ventricle and auricle through the cubital vein; studies on the Burns, Bennett and Emerson models of pneumatic balance resuscitators, performed at Bellevue Hospital under the Columbia Division; the 0.85 lens which can be used for photographing a fluorescent screen, thus eliminating the need for numerous x-ray plates and a demonstration of the oximeter.

The Medical Consultants Division displays by a series of transparencies and graphic studies certain aspects of tuberculosis which are of value to the general practitioner.

The Surgical Consultants Division displays moulages, graphic illustrations and photographs showing progress studies and essential phases of technics concerned with the utilization of an intramedullary nail in the treatment of certain fractures and interesting aspects of various amputation technics.

The Preventive Medicine Division displays pictures and graphic illustrations depicting the interrelationship of the Surgeon General's Office, the Medical Nutrition Laboratory and the Research and Development Board; the missions of the Army Nutrition Laboratory in connection with studies on troops, treatment of disease and feeding of civilians of occupied countries; the activities of army nutritionists; the relationship of nutrition to health and fitness in troops, and the importance of nutrition in the management of patients.

The Education and Training Division presents a graphic display showing the utilization of medical officers within the Army as a result of the recently organized career plan, the technical training given to those who assist the professional personnel and essential data on hospital facilities of value and interest to physicians and surgeons.

The *Research and Development Division* presents a display showing the fabrication, testing and utilization of a recently developed upper extremity prosthesis.

The Veterinary Service of the Medical Department presents certain important phases of the Food Inspection Service by kodachrome pictures, displays several items of food inspection and analysis equipment which have been developed or approved recently by the Army, and demonstrates some of the important new developments in methods of chemical and bacteriologic analyses of food products. Selected pictures, slides and photomicrographs depict important results of the research studies conducted by the corps, while features of the veterinary service for animals are shown by photographs.

The Physical Medicine exhibit depicts objectively the utilization of physical treatment methods through the integration and coordination of the triad Physical Therapy, Physical Reconditioning and Occupational Therapy which Physical Medicine in the Army embraces. Emphasis is placed on the approach to prescribed levels of treatment in these three branches by a medical officer who is a specialist in physical medicine.

The Dental Division display shows recent developments in acrylic prostheses pertinent to all types of reconstructive procedures, fixation of fractures of the maxillomandibular region and progress studies of reconstruction cases.

The Army Institute of Pathology presents by colored transparencies and photographs pathologic studies of certain intraocular tumors, peripheral nerve injuries, cold injuries, virus hepatitis and mouth infections.

United States Navy, Bureau of Medicine and Surgery, Washington, D. C.

Operations Crossroads: The exhibit portrays the medical research projects and preventive measures instituted at Operations Crossroads when the atomic bomb was tested. Two of the goats which were used at Bikini as experimental animals will be shown, with hematologic charts on the animals from the first bomb visit to the present time.

Veterans Administration

A group of exhibits is presented by the Veterans Administration, Washington, D. C., under the direction of General Paul R. Hawley.

Ralph K. Ghormley, Mayo Clinic, Rochester, Minn., and Veterans Administration, Washington, D. C. and T. McD. Anderson, Veterans Administration, Washington, D. C.:

Orthopedic Braces: Exhibit presents modifications and new developments by Veterans Administration in the design and manufacture of orthopedic braces.

Harold F. Bishop, Veterans Administration Hospital, Bronx, New York:

Endotracheal Anesthesia: Exhibit consists of a series of panels, each dealing with a different aspect of endotracheal anesthesia. Among the topics covered will be history, anatomy, technic, indications and contraindications, topical agents used with, apparatus for, and complications of.

A. Earl Walker, University of Chicago School of Medicine, Chicago, and Veterans Administration, Washington, D. C., and William G. Lennox, Harvard Medical School, Boston, and Veterans Administration, Washington, D. C.:

Post-Traumatic Epilepsy: Neurologic aspects of post-traumatic epilepsy are shown, and advances in its diagnosis and treatment are demonstrated.

Tuberculosis Division, Veterans Administration, Washington, D. C.:

Streptomycin: Presentation of a series of cases showing the effects of streptomycin in the treatment of tuberculosis.

J. M. Nielsen, University of Southern California, Los Angeles and Veterans Administration, Washington, D. C.

Mechanics of Aphasia, Apraxia and Agnosia: Recent studies and the application of their results to the treatment of post-traumatic stages in veterans.

MOTION PICTURES

Three motion picture theaters, located in rooms adjacent to the exhibits, will be in continuous operation. Each film will be shown once daily, Monday noon to Friday noon, on a definite schedule.

United States Army, Medical Department, Washington, D. C.:

Repair of Ruptured Membranous Urethra: Silent, color, ten minutes.

Yaws: Sound, color, twenty minutes.

The Preparation and Insertion of Tantalum Plate: Sound, color, thirty minutes.

Technic of Open Amputation: Sound, color, eleven minutes.

Therapeutic Exercises (Thoracic Surgery): Sound, twenty-eight minutes.

Cine Plastic Operation: Sound, color, seventeen minutes.

Operations Crossroads: Sound, color, twenty-five minutes.

J. Ernest Ayre, Royal Victoria Hospital and McGill University, Montreal, Quebec:

"Precancer" Diagnosis of the Cervix by Cytology: Motion picture demonstrating the use of a new method of uterine cancer diagnosis—the selective cytology technic. While not a biopsy, and not a smear, the selective method is a scraping from the squamocolumnar junction of the cervix by means of a specially adapted cervical applicator. The scraping gives a true "surface biopsy" of this area, so vulnerable to the development of squamous carcinoma. The test is simply and painlessly taken during the course of a routine gynecologic examination. Silent, color, fifteen minutes.

Carroll L. Birch and Louis R. Limarzi, University of Illinois College of Medicine, Chicago:

Physiology and Pathology of the Hemopoietic Principle: Motion picture showing pictures of blood and bone marrow in the megalocytic anemias. Patients with pernicious anemia, sprue, cirrhosis of the liver and aplastic anemia are demonstrated. Silent, color, twenty minutes.

Jay M. Garner and J. Peerman Nesselrod, Evanston Hospital, Evanston, Ill.:

The Sigmoid, Rectum and Anal Canal: Motion picture showing endoscopic views of the normal bowel, diverticulosis, melanosis coli, anal infection, lymphogranuloma venereum, tuberculosis enterocolitis, chronic ulcerative colitis, polyp with fulguration and carcinoma of the rectum. Silent, color, thirty minutes.

Andrew B. Rivers, Natalie M. Briggs and Maurice H. Stauffer, Mayo Clinic, Rochester, Minn.:

The Syndrome of Duodenal Ulcer Perforating to the Pancreas: Motion picture showing that there are certain characteristics such as a shift of pain to new areas and a postural method of relief that patients assume which aids in recognition of the complication. Silent, color, twenty-five minutes.

Leo L. Hardt and E. C. Olson, Loyola Medical School and Cook County Post-Graduate School, Chicago:

Gastroscopy as an Aid in the Diagnosis and Treatment of Gastric Disease Conditions: Motion picture showing: 1. A typical gastroscopic clinic, demonstrating the preparation of the patient and the technic of gastroscopy. A brief description of the Hardt gastroscope, together with comments as to its limitations. 2. Gastroscopic study of the physical appearance of various antacids introduced in the stomach, compared with a new antacid mixture. Sound, color, thirty minutes.

Committee on Medical Motion Pictures, American Medical Association, Chicago:

The Evolution of Medical Motion Pictures: Motion picture consisting of excerpts from several films made prior to, during and following World War I. The first surgical motion picture taken on 16 mm. film is included. Examples of modern technics such as animation, microcinematography, endoscopic photography and moving x-rays are illustrated. The final sequence provides a brief behind the scenes look into the production of good teaching film. Sound, color, thirty-five minutes.

Hugh A. Gamble, Gamble Brothers and Archer Clinic, Greenville, Miss.:

Interinnomino Abdominal Amputation of the Lower Extremity for Malignant Growths with Indications for the Extension of its Employment: Motion picture describing the operative procedures. Silent, color, twenty-seven minutes.

I. W. Magill, Westminster Hospital, London, England:

Technic of Anesthesia—Handling and Care of the Patient: Motion picture dealing with the general care of the patient. Sound, twenty-six minutes.

I. W. Magill, Westminster Hospital, London, England:

Endotracheal Anesthesia: Without a clear airway the administration of a general anesthetic is impossible. This film shows how endotracheal anesthesia overcomes this difficulty by intubation of the larynx. Both oral and nasal methods are given in some detail. Animated diagrams and shots taken actually down a laryngoscope show the principles involved in using this instrument, while slow motion photography elucidates the movements required for "blind" nasal intubation. The advantages of endotracheal anesthesia are summarized. Sound, twenty-six minutes.

John C. Ullery, Upper Darby, Pa.:

Continuous Spinal Analgesia in Cesarean Section: Motion picture shows the anatomy and technic of continuous spinal analgesia for performing a cesarean section. Silent, color, forty-three minutes.

H. F. Hailman, Medical Department, Upjohn Company, Kalamazoo, Mich.:

Energy Release from Food: Motion picture with animation shows the enzymatic role of the vitamins of the B complex in the metabolism of food. The picture explains, on a biochemical basis, the need for vitamins of the B complex in various clinical conditions. Sound, color, twenty-six minutes.

A. H. Bulbulian, Mayo Clinic, Rochester, Minn.:

Technic of Prosthetic Restoration of the Face: Motion picture dealing with some of the recent developments in the technic of facial reconstructions by the prosthetic method. It shows the important steps of the procedure, such as taking the necessary impression of the site of the deformity, preparation of the temporary wax model of the proposed prosthesis, making the final mold and methods of coloring and processing the prosthesis in latex and plastic. Silent, color, fifteen minutes.

J. E. M. Thomson, C. F. Ferciot and W. W. Bartels, Orthopedic Clinic, Lincoln, Neb.:

The Reverse Dennis-Browne Splint as Used in Treatment of Congenital Calcaneovalgus: Calcaneovalgus tendencies of a congenital nature are more common than recognized. These babies tend to sleep on the abdomen with the toes turned outward. Dorsum of feet can be readily approximated to the outer aspect of the leg, and there is decided prominence of the heel. Unless this tendency is corrected, definite structural weakness of the feet develops which delays walking and may result in permanent foot disability. Early correction is urged. Application of reverse Dennis-Browne splints to hold feet in position of overcorrection is demonstrated and the indications are discussed. Silent, color, twelve minutes.

Rudolph Jaeger, Jefferson Hospital, Philadelphia:

Removal of Intraorbital Tumor by Intracranial Approach: Motion picture presenting removal of a dermoid cyst from within the orbit by intracranial craniotomy approach. Appearance of patient before and after operation as well as operative procedure is shown. Silent, color, eighteen minutes.

Harold C. Voris, Loyola University Medical School, Chicago:

Ventriculography: Motion picture illustrating the technic of ventriculography by the usual posterior route and also the frontal and lateral route. Artist's diagrams are included in the film. Silent, color, thirty-five minutes.

L. E. Holmgren, Jackson Clinic, Madison, Wis.:

Varicose Veins—Diagnosis and Treatment: Motion picture demonstrating the various diagnostic tests and the application of these tests to various patients. The operative technic of a high saphenous ligation is shown followed by the postoperative tests made to demonstrate the need, if any, for further treatment. Silent, color, thirteen minutes.

Lester R. Dragstedt and Paul V. Harper, University of Chicago, Chicago:

Section of the Vagus Nerves to the Stomach in the Treatment of Peptic Ulcer: Motion picture illustrating the technic of transabdominal section of the vagus nerves to the stomach, together with a brief statement of the theoretical basis for this operation. Silent, color, approximately twenty minutes.

Malcolm T. MacEachern, American College of Surgeons, Chicago:

Anomalies of the Bile Ducts and Blood Vessels and Strictures of the Common Duct: Motion picture demonstrating the most common anomalies of the bile ducts and blood vessels and strictures of the common duct and their surgical repair. Silent, color, forty minutes.

Herbert R. Hawthorne, Graduate Hospital, University of Pennsylvania, Philadelphia:

Transthoracic Resection for Carcinoma of the Cardiac End of the Stomach: Motion picture for teaching graduate students in surgery at the University of Pennsylvania, showing the entire technic from beginning to end. Captions describe the anatomy and technic as the operation progresses. The surgical anatomy involved is clearly shown. The placing of the sutures between the gastric tube and the esophagus is further classified by a drawing with explanatory captions. Silent, color, twenty-five minutes.

A. W. Oughterson and **G. W. Larimore**, American Cancer Society, Inc., New York:

The Traitor Within: Motion picture, with animation, telling ie medical facts about cancer in understandable terms. It resents the growth and development of cells; the spread of ancer through the body; the control and cure of cancer through he use of surgery, roentgen rays and radium. While this picure is not a technical film designed primarily for physicians, is believed that it will be of interest to them since it portrays y animation in technicolor the malignancy process. Sound, olor, eleven minutes.

Henry Sangree, Howard Fretz, John Hughes and **Norton roth**, University of Pennsylvania, Philadelphia:

Fertility in the Male, Surgical and Clinical Problems: Motion icture showing (1) the epididymovasostomy operation, (2) the mbredanne operation (penile hypospadias). Preliminary photoraphs of the subject of infertility in the male are shown with onsecutive stages in the operation to their completion, using adavers for difficult procedures and then operative room technic. statistical report on 300 consecutive men examined is included. ilent, color, eighteen minutes.

R. H. Flocks, University of Iowa School of Medicine, Uniersity Hospitals, Iowa City:

Ureterointestinal Anastomosis—A New Method: Motion picure presenting a new method for ureterointestinal anastomosis ased on the principle of preservation of ureteral blood supply t the point of the anastomosis. The method is described briefly nd then illustrated on a patient. The results are illustrated ith pyelograms taken late after the procedure. Silent, color, hirty minutes.

Alfred Iason, Adelphi Hospital, Brooklyn:

Repair of Bladder Hernia: Motion picture showing that one f the causes of so-called recurrence of inguinal hernia is an verlooked or improperly repaired bladder protrusion through he inguinal triangle. The indirect component is repaired and he bladder protrusion is exsected as though it were diverticulum, nd repair then consummated. Silent, color, twelve minutes.

M. M. Melicow, J. Robinson and **William Ivers**, Squier Urological Clinic, Presbyterian Hospital, New York:

Interstitial Cell Tumor of Testis: Motion picture illustrating the effect on a 5½ year old boy of an interstitial cell tumor which was present in his right testis. The boy was big for his age, his external genitalia were like those of adult, the pubic hair grew. Silent, color, five minutes.

D. O. Ferris, Mayo Clinic, Rochester, Minn.:

Total Cystectomy with Bilateral Ureterosigmoidostomy for Carcinoma of the Bladder (one stage): Motion picture showing detailed technic of a one stage cystectomy with bilateral ureterosigmoidostomy. Silent, color, twenty minutes.

Roger W. Barnes and **R. Theodore Bergman**, College of Medical Evangelists School of Medicine, Los Angeles:

Use of the Calf for Surgical Training and Research: Motion picture outlining the advantages of the use of calves for animal surgery in the training of residents and fellows and for surgical research. A ureterointestinal anastomosis is shown being performed by two first year residents in urology. Silent, color, twelve minutes.

Paul F. Fletcher, St. Louis University School of Medicine and St. Louis County Hospital, St. Louis:

Abdominal Colpocystopexy for Complete Prolapse of the Bladder and Vagina: A presentation of the rectus suspension principle of operative treatment for complete prolapse of the bladder and vagina following panhysterectomy. Technic is shown in detail, whereby living fascial strips mobilized from the anterior sheath of the rectus muscle on each side are employed to effect permanent restoration of normal visceral relationships of these structures in the pelvis. The construction of a "crossed suspender support" for the base and posterior wall of the bladder is demonstrated. Physical findings on examination one year and five years after operation are included. Silent, color, eighteen minutes.

Special Exhibit Committee on Physical Medicine: The following motion pictures are presented in connection with the Special Exhibit on Physical Medicine:

Rehabilitation of Chronic Neurologic Cases: Motion picture prepared by the Veterans Administration and presented in connection with the exhibit on Physical Rehabilitation for Hemiplegia. Sound, twenty minutes.

Cineplastic Prosthesis in the Elbow of the Amputee: Motion picture prepared by Henry H. Kessler, Newark, N. J., and presented in connection with the exhibit on Physical Rehabilitation of Amputees. Silent, ten minutes.

Training of the Amputee in Walking: Motion picture prepared at Hasbrouck Heights Amputee Clinic and presented in connection with the exhibit on Physical Rehabilitation of Amputees. Silent, eighteen minutes.

Comeback: Motion picture prepared by U. S. Office of Vocational Rehabilitation. Sound, color, twenty-six minutes.

Be Your Age: Motion picture prepared by Metropolitan Life Insurance Company and American Heart Association. Sound, eleven minutes.

Half a Chance: Motion picture prepared by the Surgeon General's Office, U. S. Army. Sound, eleven minutes.

The Sky Is the Limit: Motion picture prepared by the Surgeon General's Office, U. S. Army. Sound, color, twenty minutes.

Convalescent Care and Rehabilitation of Patients with Injury of the Spinal Cord: Motion picture prepared by the Surgeon General's Office, U. S. Army. Sound, color, forty-one minutes.

Harry Wallerstein, Jewish Memorial Hospital, New York:

Treatment of Erythroblastosis Fetalis by Substitution Transfusion: Motion picture giving a brief résumé with pathologic slides of the significant pathologic changes in erythroblastosis. Kernicterus and histologic slides of the significant liver changes, as well as peripheral blood smear, are included. The technics of the procedures described are enumerated step by step and illustrated by actual performance on the screen. Charts are included in the film to show comparative results. Methods using the superior sagittal sinus, the radial artery and superficial veins are included. Silent, color, twenty-five minutes.

Otto Steinbrocker, Norman Spitzer and **H. Harold Friedman**, Bellevue Hospital, New York University, New York:

The Shoulder-Hand Syndrome (Reflex Dystrophy of the Upper Extremity): Motion picture of combined shoulder-hand disorders showing signs of reflex neurogenic dystrophy. Cases of varied etiology with this syndrome and their evolution are illustrated, together with descriptions of the clinical course and diagrams of the presumed physiologic mechanism. A classification of these disorders is included. Present treatment is outlined. Silent, color, twenty minutes.

Philip Thorek, Cook County and American Hospitals, Chicago:

Congenital Diaphragmatic Hernia: Motion picture presenting an unusual case of congenital diaphragmatic hernia in a 7 weeks old infant. The diagnosis is discussed and the x-ray film shown both preoperatively and postoperatively. An animated section of the film is devoted to the abnormal anatomy and the embryologic defect presented, in this case a congenital absence of the left diaphragmatic crus. The operation shows cutting the left triangular ligament of the liver as an aid to exposure and repair of the hernia. The steps of the surgical repair and the replacement of viscera are clearly shown. A new method of closure of the abdominal wall is depicted. Silent, color, fifteen minutes.

James Barrett Brown and Frank McDowell, Washington University School of Medicine, St. Louis:

Neck Dissections for Metastatic Carcinoma: Motion picture showing one operation of complete unilateral neck dissection for metastatic carcinoma from the mouth, together with later pictures of patients cured from five to fifteen years by this procedure. One of the patients shown has been well following operation for a metastatic melanoma eleven years ago. Silent, color, twenty-one minutes.

Bernard D. Judovich and William Bates, Graduate Hospital School of Medicine, University of Pennsylvania, Philadelphia:

Scalenus Anticus Syndrome: Motion picture of patients suffering with symptoms of scalenus anticus syndrome. Detailed explanation of etiology, symptomatology, diagnosis and treatment is presented, with differentiation of primary and secondary scalene syndromes. Simplified hypo-needle technic for diagnostic and therapeutic infiltration is shown. Cases which clinically simulate the pain of coronary disease are presented. Electrocardiograph changes induced by compression of the scalene muscle is included. Silent, color, twenty minutes.

Alfred Iason, Adelphi Hospital, Brooklyn:

Repair of Sliding Hernia: Motion picture showing that difficult sliding hernias can be readily cured by careful dissection of transversalis fascia from peritoneum. One leaflet of transversalis fascia is then sutured to peritoneum as though both were part of the sac. Silent, color, twelve minutes.

W. M. Adams, Memphis, Tenn.

The Correction of Facial Paralysis by Muscle Transplantation: Motion picture showing the correction of complete facial paralysis by multiple muscle substitution. A pedicle of the masseter muscle is transplanted in a region of the corner of the mouth to give support and motion to this region. The temporalis muscle is dissected up from the head of the coronoid process and a portion transferred into the upper and lower eyelids to give support to the lower eyelid and permit the patient to open and close the eyelids. A portion of the opposite frontalis muscle is transferred across the midline of the forehead into the muscle and subcutaneous tissue of the supraorbital region to give support to the eyebrow and restore a certain amount of motion upward. Silent, color, twenty-seven minutes.

Alfred Blalock, Johns Hopkins Hospital, Baltimore:

Surgical Treatment of Pulmonic Stenosis: Motion picture begins with preoperative views of a 5 year old cyanotic child with a diagnosis of the tetralogy of Fallot. The child is then anesthetized, the right pleural cavity is opened, the right pulmonary artery is exposed, and the right subclavian artery is exposed. The proximal end of the right subclavian artery is anastomosed to an opening in the side of the right pulmonary artery, an end to side anastomosis. Incisions in the mediastinal pleura and in the chest wall are then closed. Postoperative views show the child on the thirteenth postoperative day and six months following operation. Silent, color, forty-five minutes.

Henry R. Viets and Robert S. Schwab, Massachusetts General Hospital, Boston:

Myasthenia Gravis (Erb-Goldflam Syndrome) 1941-1946: Motion picture depicting briefly the history of the knowledge of this disease, the treatments used prior to the instigation of neostigmine in 1934, the current treatment of the disease, and a summary of 175 cases observed since 1935 in the Myasthenia Gravis Clinic at the Massachusetts General Hospital, Boston. Silent, twelve minutes.

H. G. Kobrak, University of Chicago, Chicago:

See the Ear Hear: A motion picture on the function of the ear, showing how a method was developed by which the acoustic vibrations of the ear could be seen and photographed for the first time. The motion picture shows the eardrum of an ear of a normal person vibrating when a sound impinges on the drum membrane. Normally, observations are restricted to the eardrum. The deeper parts of the ear were investigated on living animals and on fresh human temporal bones. The acoustic vibrations of the ossicular chain are demonstrated. The reflex contractions of the middle ear muscles during hearing are shown (animal observations and observations in patients). Diseased middle ears are demonstrated (middle ear adhesions, fluid in tympanic cavity, stapes fixation). The acoustic vibrations of the inner ear are shown (stapes footplate, round window membrane, oscillations of the intralabyrinthine fluid). The response of the ear to music is demonstrated. Silent, twelve minutes.

Paul H. Holinger and Albert H. Andrews Jr., University of Illinois College of Medicine, Chicago:

Diseases of the Esophagus: Motion picture giving the clinical histories, laboratory data and roentgenograms of patients with various organic diseases of the esophagus; then by means of motion pictures taken through the esophagoscope the esophagoscopic appearance of the lesions is shown. The technic of esophagoscopy is illustrated by serial roentgenograms taken as the esophagoscope is introduced, as well as by pictures of esophagoscopic procedures. The normal esophagus, lye strictures, diverticula, cardiospasm, foreign bodies and esophageal carcinoma are shown. Silent, color, thirty minutes.

Julius Lempert, Lempert Institute of Otology, New York:

Lempert Fenestra Nov-Ovalis Operation for Clinical Otosclerosis: Motion picture describing the operative procedures. Silent, color, forty-five minutes.

United States Navy, Bureau of Medicine and Surgery, Washington, D. C.:

Psychosomatic Disorders: Sound, twenty-two minutes.

Sciatic Pain and the Intervertebral Disk: Sound, color, twenty-five minutes.

Facial Neuralgias: Sound, color, twelve minutes.

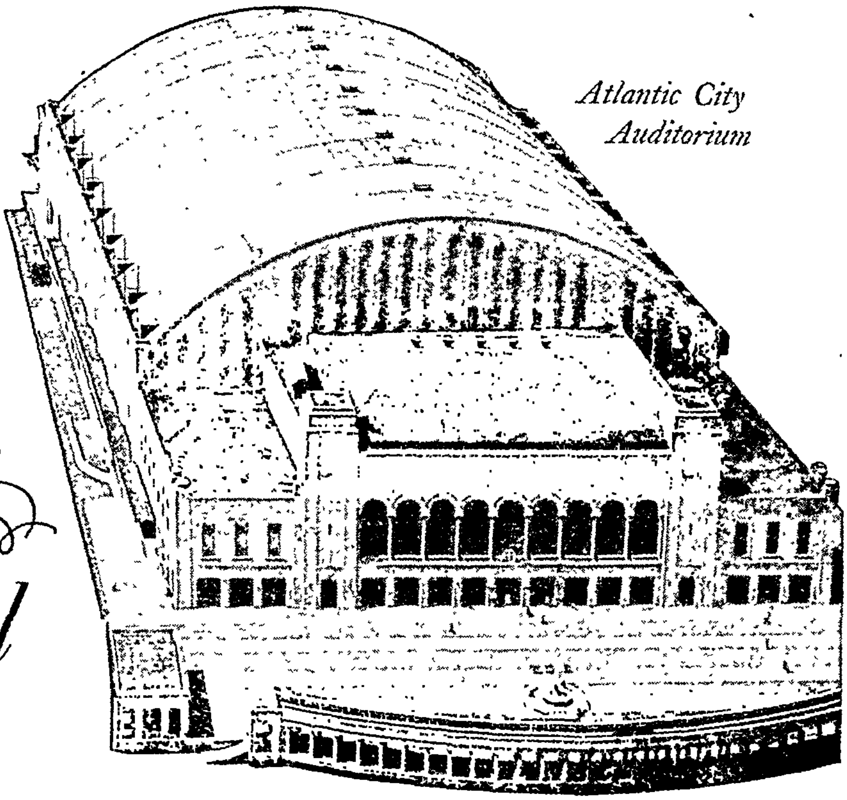
Management of Spinal Cord Injuries: Sound, color, eleven minutes.

Asiatic Schistosomiasis: Sound, color, twenty minutes.

LANTERN SLIDE DEMONSTRATION

Timothy Leary, Medical Examiner, Suffolk County, Boston:

Nature's Method of Preventing Atherosclerosis in Youth: The lesions of atherosclerosis, the important form of arteriosclerosis, arise in the arterial intima about macrophages carrying irritant cholesterol ester crystals. Deposits of these crystals in the arterial intima occur at all ages under diets rich in cholesterol. In youth these deposits disappear, in most cases without trace. The removal of the crystals is due to fibroblasts which take over the crystals and bring them into solution in fat staining material that is metabolized within the cells and disappears. The restitution of the intimal tissue is usually quite perfect. This power to remove crystalline ester deposits is lost largely in the adult period, except in the ascending aorta. Slides will be shown illustrating steps in the removal of the irritant esters. Thirty minutes.



Technical Exposition

The Technical Exhibits this year may well bring a deep feeling of pride to the manufacturers and great satisfaction to the medical profession. In keeping with the Centennial theme, many firms are conforming to the historical keynote of "100 Years of Progress in American Medicine." This elaborate showing of new and important products evidences the progress of our medical industries which have geared themselves to the amazing advances in scientific medicine and in the maintenance of the health of our nation.

Practically every single exhibit will offer the visiting physician something of immediate interest. The pharmaceutical firms will present new drugs or new scientific information. Leading medical publishers will show new books, new editions, as well as their standard works. Producers of food will feature newest developments in nutrition. Instrument, apparatus, and supply houses will offer brand new items, improvements over the old, and new technics.

Altogether more than 282 firms are participating in the Technical Exposition, and will present their products and technics in an impressive and dramatic way, with skilled technicians and researchists in attendance.

Because the Technical Exposition, Scientific Exhibits, General Scientific Sessions, and important Section Meetings are being housed within the Atlantic City Auditorium, physicians will find it convenient to visit exhibits at any time. The Technical Exposition is really one of the practical, educational features of the Annual Session and leisured, unhurried time given to it every day will prove pleasurable, instructive and profitable.

Exhibits are open each day from 8:30 a. m. to 6 p. m., closing at 12 noon Friday, June 13. On the following pages are brief descriptive items of most of the Technical Exhibits.

Thos. R. Gardiner,
Business Manager and Director of Exhibits

Apparatus and Instruments

A. S. ALOE COMPANY
Booth, H-19, H-21, H-23

The A. S. Aloe Company cordially invites you to visit booths H-19, H-21 and H-23. In addition to a complete cross section of surgical, medical, and laboratory equipment and supplies, of special interest will be a display of government surplus instruments. All of these are new, first quality instruments—currently offered at one third to one half list price.

AMERICAN CYSTOSCOPE MAKERS, INC.
Booth C-3

A special feature of this exhibit will be a panel depicting progress in the develop- [illegible] rological equip- [illegible] a complete line [illegible] scopes, proctoscope [illegible] instruments for eye, ear, nose, and throat work and equipment for use of electrosurgical procedures will be demonstrated.

AMERICAN HOSPITAL SUPPLY CORP.
D-23 (½)

Physicians are invited to see Baxter's blood banking and plasma equipment. There will be expendable tube and needle sets demonstrated, and an ingenious method for the cleaning of as many as eight lengths of tubing or eight hypo needles at one time. In addition Aero-Klenz, the deodorant that *destroys* odors, will be on hand as well as the E & J Resuscitator and many other new items of interest.

AMERICAN MEDICAL SPECIALTIES CO., INC

Booth E-28

A number of Amsco products will be displayed in booth E-28, among them: Lindley Folding Pessaries, Infantometers; Biro Ampoule Openers; their new X-Ray View Boxes; and other specialty products for which Amsco has been known for years.

AMERICAN OPTICAL COMPANY

Booths B-1, B-2, C-1, C-2

Exhibited here are scientific and ophthalmological instruments and equipment of special interest to physicians Among the many AO instruments shown are the recently announced Spencer hemoglobinometer, the Spencer Hb-Meter, and the new AO Renshaw Stereo-Disparator—a new orthoptic device that will surely interest practitioners Another interesting feature is a complete display of the AO Monoplex plastic artificial eye

AMERICAN STERILIZER COMPANY

Booth G-7

The new Overholt-Comper Thoracic Table for accommodation of patient-posturing and for bronchoscopic work under bilateral fluoroscopy will be exhibited with other "American" Surgical Operating, Obstetrical, and Fracture Tables. Of particular interest to the surgeon are the new "American" Pressure Instrument Washer-Sterilizer and the new Office Autoclave—an 8x8x16" chamber of Monel construction, with square door and simplified semi-automatic control.

AUSTENAL LABORATORIES, INC.

Booth I-29 (E½)

"Homo Vitallium," an exhibition skeleton with many varied Vitallium appliances in place, will be displayed here. Included in the exhibit will be the complete line of Vitallium appliances which have been redesigned; bone plates and screws; hip nails and screws, hip caps; bolts, intertrochanteric appliances; radius caps; leg screws; spinal fusion plates; mandibular fracture appliances, bile duct, blood vessel and drainage tubes.

BARNETT OPTICAL LABORATORIES

Booth E-1

Clinical photographic apparatus, Kodachrome Slide Libraries, slide projectors, viewing devices, and physicians' examining lamps will be exhibited at this booth Owners of Leica, Contax, Exakta, Perfex, and Argus cameras interested in adapting them for clinical photography are urged to bring them along for a discussion of adaptability.

RUDOLPH BEAVER

Booth J-27

Of particular interest to surgeons is the exhibit of Rudolph Beaver where the Beaver knife and those all-bellied DeBakey knife blades are shown In any position, these knives present a rounded, or bellied, cutting edge so useful in dissecting, in deep and special surgery including hysterectomy, cholecystectomy, mastectomy, lobectomy; and in operations of the throat, semilunar cartilage, etc

BECTON, DICKINSON & CO.

Booths I-9 I-11

Representatives at the booth will be glad to demonstrate the use of Vacutainer equipment in a new method of obtaining blood specimens. A full line of Ace Bandages will be on display, and experts in bandaging technic will gladly demonstrate various uses of all types "A prominent feature of the display will be a chart showing the development of the hypodermic syringe during the past 100 years

BEDFORD SURGICAL COMPANY, INC.

Booths H-5, H-7

A representative line of the Continental products will be displayed here You won't want to miss the completely new medical equipment featured. You are invited to visit their exhibit in booths H-5 and H-7 for a helpful discussion of your office problems with competent medical service technicians.

J. BISHOP AND COMPANY

Booth H-14

The exhibit of the Medical Products Division of J Bishop and Company Platinum Works features two innovations in hypodermic medication—the Bishop "Albalon" plastic hub needle, and the recently introduced "Tubex" syringe developed by Bishop and used by Wyeth, Inc. for their injectable penicillin preparations Bishop's complete line of "Blue Label" needles for every hypodermic use is also displayed

THE BURDICK CORPORATION

Booth A-11

The Burdick Corporation will exhibit their complete line of Physical Therapy equipment This will include Short Wave Diathermy, Ultraviolet and Infra-red Lamps, Muscle Stimulator and the Rhythmic Constrictor for the treatment of Peripheral Vascular conditions. Physicians and Technicians are invited to register for a free copy of the Burdick Syllabus, a compilation of clinical material on the electrode therapy.

CAMERON SURGICAL SPECIALTY COMPANY

Booths B-14, B-16

On display here will be the new Cameron Units for Electro-coagulation, Electro-cauterization and Electro-surgery; Coagular-Sigmoidoscope; Electro-Diagnostosets; Flexible Gastroscopes; Bronchoscopes—Esophagoscopes—Laryngoscopes, Mirrolite; Binocular Spectacle Loupe; Magniscope and other specialties.

WILMOT CASTLE COMPANY

Booths G-6, G-8

New developments in post-war surgical lighting and in sterilization will be displayed here Lights for major operating work and spotlights for clinics and physicians' offices will be shown The new lights will be especially worth seeing. Also newer technics for handling the cleansing and sterilization of instruments will be demonstrated. The use of oil as a sterilizing medium will receive special consideration

THE CAYO COMPANY

Booth EP-4

In Booth EP-4, The Cayo Company will demonstrate stab sawing, which permits of cutting squarely into the bone without previous drilling A feature of the Cayo Reciprocators is that they will cut bone but will not cut soft tissue

WARREN E COLLINS, INC

Booth G-21

Booth G-21 will be headquarters for respiration apparatus—Collins Iron Lungs, Oxygen Tents, Metabolism and Vital Capacity Apparatus Trained technicians will be in attendance to show you the latest developments in this field and to answer your questions.

DePUY MFG COMPANY

Booth B-30

Fracture appliances made of aluminum of the more simple type for the general practitioner, the new DePuy Screw and Plate Rack for the convenience of the bone surgeon, and a pair of simple screw drivers for the orthopedic surgeon will attract interest at the DePuy booth. Representatives in attendance will be glad to discuss your fracture appliance problems.

THE DeVILBISS COMPANY

Booth J-6

Ever encouraging reports relative to spraying or the inhalation of penicillin and other antibiotics make the DeVilbiss Company exhibit in booth J-6 of pertinent interest Atomizers, nebulizers, vaporizers, and powder blowers, for home as well as office use, will be displayed. There are types for any treatment where spray application or inhalation is to be employed.

E & J MANUFACTURING COMPANY

Booth C-12

The E & J Manufacturing Company will exhibit their large tank model resuscitators. This type of unit enables the hospital to greatly decrease the cost of operation without sacrifice of mobility Interesting demonstrations well be given.

J. H. EMERSON COMPANY

Booth G-24

Emerson will exhibit its latest respirator development which is a dome placed over the head of the patient to keep him breathing when the respirator is open, greatly facilitating care of the patient's body Other items displayed include a new radio for respirator patients, single and 2-way patient model resuscitators, and a novel device for the preparation of hot packs

H G FISCHER & CO.

Booth H-25

Visitors to the Centennial Meeting of the American Medical Association in Atlantic City are cordially invited to visit the Fischer display booth, and to inspect the new units of Fischer apparatus which are characterized by precision design and simple, efficient operation Fischer representatives will be present to answer questions and to demonstrate outstanding features of Fischer equipment.

THE FOREGGER CO, INC

Booth C-30

Anesthesia is now a highly specialized art and some of the procedures entailed require highly specialized equipment. Foregger Company specializes in equipment for endotracheal and endobronchial technic as well as for general gas oxygen ether anesthesia New apparatus for large and small tanks and refinements in standard equipment including special apparatus for anesthestizing new born infants will interest surgeons and anesthetists

GOMCO SURGICAL MFG CORP.

Booth B-26

In addition to their line of physicians' and explosion proof hospital pumps, Gomco are featuring at the June meeting their new Tidal Irrigator After several years of clinical research they have perfected a Tidal Irrigator that is simple to operate and is fool-proof. This unit will be shown for the first time at the American Medical Association Meeting

HANDVIA CHEMICAL AND MANUFACTURING COMPANY

Space D-30

Late models of self-lighting ultraviolet quartz lamps for orificial and body irradiation, black light for diagnostic purposes, and Safe-T-Aire germicidal lamps for the destruction of air-borne bacteria will be

featured at the Hanovia exhibit. Competent and courteous representatives will be at your disposal.

ILLE ELECTRIC CORPORATION
Booth H-10

Ille Electric Corporation will demonstrate in Booth H-10 how the care of infantile paralysis, arthritis, and other disabling conditions can be greatly improved by the use of Hydromassage Subaqua Therapy Tanks. The corporation will also display an improved Mobile Whirlpool Bath, Mobile Sitz Bath Chair, Improved Paraffin Bath and Folding Thermostatic Bed Tent.

FRANK J. JANKUSKAS
Booth EP-17

The busy physician of today needs all the mechanical help he can get to make his tasks go easier and more quickly. Outfits for measuring capillary fragility, cutaneous lymphatic flow, and blood thiocyanates, can be a material help in these circumstances. For such outfits see the Frank J. Jankuskas exhibit in Booth EP-17.

KANSAS CITY ASSEMBLAGE CO.
WP-15 (No. ½)

The Padgett-Hood Dermatome for Cutting Calibrated Skin Grafts will be demonstrated here. By the use of the Dermatome a sheet of skin of any size up to 4x7¾ inches of uniform thickness may be removed from almost any part of the body—thigh, abdomen, chest, or back. A calibrating mechanism allows one to regulate the thickness of the skin sheet at will.

KIDDE MANUFACTURING CO., INC.
Booth H-11

This firm in its initial exhibit at an AMA Convention, will display the Kidde engineered Utero Tubal Insufflator. Its simple *operation—one* valve, one gage—requiring only small cartridge of Carbon Dioxide gas, will be of especial interest. Also on exhibit will be the Kidde Dry Ice Apparatus used *in treatment of superficial* skin lesions. This apparatus, too, because of its simplicity, is becoming increasingly popular.

CHARLES LENTZ & SONS
Booth A-9

Charles Lentz & Sons are proud to have contributed eighty-one years of their existence to the service of the medical profession—not only in America, but throughout the world. Their Exhibit will display fine American-made Stainless Steel surgical instruments.

THE LIEBEL-FLARSHEIM CO.
Booth J-29

The Liebel-Flarsheim Company cordially invites you to stop at Booth J-29 for examination and demonstration of their latest model diathermy and electrosurgical apparatus. Capable representatives will be on hand at all times to answer your questions about physical therapy and electrosurgical apparatus.

THE LINDE AIR PRODUCTS COMPANY
Booth H-9

Administration of oxygen to children will be emphasized at The Linde Air Products Company's exhibit. An oxygen piping system, which supplies oxygen directly to bedside outlets in nursery or ward; a new motion picture "Oxygen Therapy in Heart Disease"; and the Beckman Oxygen Analyzer will be featured. The Beckman Analyzer, which works on an entirely new principle, shows oxygen concentration on a scale at the push of a button.

THE MAICO CO., INC.
Booth B-29

The Maico exhibit will feature—along with the Maico Audiometer—the improved Maico Atomeer Hearing Aid. The Maico Company executives who will attend the Maico exhibit will welcome the opportunity of discussing hearing aid fitting with the doctors on the basis that an exchange of ideas may be mutually beneficial.

McINTOSH ELECTRICAL CORPORATION
Booth WP-11

In Space WP-11 will be shown several popular models of McIntosh apparatus for physical medicine. Foremost among such units is the Hogan Brevatherm Model ♯8890 Short-Wave Diathermy apparatus with frequency stabilization. The McIntosh ♯1521 Sinustat and the McIntosh ♯3386 Biolite Infra-Red Generator will also be shown. The McIntosh Electrical Corporation founded in 1879 is now more than sixty-eight years old.

MEDICAL QUARTZ PRODUCTS COMPANY
Booth F-3

The Medical Quartz Products Company, a division of Dallons Laboratories, will *show the actual fabrication of Quartz Ultra* Violet generators. With an expert operator daily making some of the more intricate devices, many of the properties of Quartz together with the skill required in its processing, may be seen. Also displayed will be the finished apparatus in which these products are used.

V. MUELLER & COMPANY
Booth C-10

One of the highlights of the V. Mueller exhibit, the new Mueller Electronic Tonometer, is expected to create unusual interest. An entirely new type of tonometer, it gives the physician dependably accurate tonometric readings, may be checked and recalibrated quickly before and after each test, if desired. The display will also include a complete line of standard and special surgical instruments.

THE NATIONAL ELECTRIC INSTRUMENT CO., INC.
Booth F-22

The National Electric Instrument Co., Inc., manufacturers of the famous "National" illuminated diagnostic and cautery equipment, has completed extensive plans for demonstrating the uses of various surgical and ophthalmic products of interest to all specialists and general practitioners. Convention visitors will also be shown visual proof of how "National" through volume sales, has continued to maintain highest quality without appreciable price increases.

ORTHOPEDIC FRAME COMPANY
Booth WP-9

The Orthopedic Frame Company, will exhibit the new Stryker Hip-nailing Board and Cassette Holder, a device to be used on any operating table by the orthopedic surgeon. This board in use maintains internal rotation of the femur and facilitates the use of the x-ray. Also displayed will be the Stryker Electric Cast Cutter and the Stryker Turning Frame.

PARAPHONE HEARING AID, INC.
Booth I-3 (W½)

The PARAVOX display will feature the Internal-Type Plastic Chassis, exclusive with PARAVOX. Tests made on this chassis required more than 200 pounds to cause a slight break. Also shown will be the miniature tubes, an "economizer" which enables the consumer to obtain more than 60 hours from one 10c "A" battery—and a giant size reproduction of the PARAVOX.

THE GEORGE P. PILLING & SON COMPANY
Booth I-10

Physicians are offered an opportunity to inspect the many nationally known and important Pilling-made items, including Lemmon apparatus for fractional or continuous spinal anesthesia, the Tocantins sternal transfusion needles, thoracic instruments developed in cooperation with prominent specialists and pneumothorax apparatus. Specialized instruments will include the BRUENING otoscope, a new ear syringe, Kennedy vaginal hysterectomy instruments —and the Kasper headlight.

THE PROMETHEUS ELECTRIC CORP.
Booth C-27

The Prometheus Electric Corporation will display its improved line of Instruments—Sterilizers, Food Conveyors, and Operating Lights. Its exhibit will feature many improvements that have been made on these items during the post-war period.

RITTER COMPANY, INC.
Booths F-32, G-31, G-32

On exhibition are the Ritter Ear, Nose and Throat Unit, complete with instruments, Ritter Motor Chair, the Ritter Shockproof X-Ray, Ritter Compressor, Ritter Rest and Relief Stool, Ritter Mobilrest Stool, Ritter Fluorescent Light, Ritter Sterilizer and Ritter Bone Surgery Engine.

SIEBRANDT MANUFACTURING COMPANY, INC.
Booth H-31

Displayed here is a new type Portable Fracture Table, which will serve for reduction and alignment of the various conditions required in fracture treatment. The exhibit's outstanding feature is a full length Casette Tunnel for holding all sizes of x-ray cassettes for either pelvic, spinal, or cervical examination. Also shown are the Goodwin Bone Clamp, Clayton Transfixion Splints, and a complete line of fracture equipment.

J. SKLAR MANUFACTURING CO.
Booth H-26

The Sklar exhibit features a large display of Stainless Steel Surgical Instruments. Many of these are new instruments never shown before at any A. M. A. Convention and comprise a great number of specialized instruments, developed and produced in cooperation with leading American surgeons. On display also are exclusive models of Suction and Pressure Apparatus: Imperatori, Ralks, Moorhead, Tompkins Portable, Tompkins De Luxe and Davidson Pneumothorax Apparatus.

C. M. SORENSEN CO., INC.
Booth C-32

C. M. Sorensen Co., Inc.—Will have on displa[illegible]g of the Ameri[illegible]v of their latest [illegible] Suction and [illegible]enicillin, which [illegible]mp; Ear, Nose, and Throat Treatment Outfits with *accessories; Suction and Ether Apparatus.*

WELCH ALLYN, INC.
Booth I-25 (E½)

New post war instruments developed by Welch Allyn, Inc. are to be presented at the Centennial meeting of the American Medical Association. A new instrument [illegible] Anascope, *Current* [illegible] Head Mirror, and Otoscope specula

will be shown for the first time. The display also features the No 110 Ophthalmoscope and Montague Recto-Sigmoidoscope set.

WESTERN ELECTRIC COMPANY
Booth E-16

Featured at the Western Electric Booth will be a display showing the latest Western Electric Hearing Aids, Group Hearing Aids, and Diagnostic and School Type Audiometers Representatives will be in attendance at the booth to answer questions concerning the products displayed. The Western Electric Company is the manufacturing unit of the Bell Telephone System and producers of communication and electronic equipment

ZIMMER MANUFACTURING COMPANY
Booth F-15

This exhibit will feature a complete line *of improved Fracture Equipment* Among the newer items on display will be the Godoy-Moreira Hip Fracture Set, Adjustable Intertrochanteric Plate and Nail, Rizzo Retractor, Orthopedic Hammer, Orthopedic Mallet, Martin Hip Gouge, Intramedullary Fixation Set, Webb Bolt Fixation Set, Eggers Contact Splints, Hollow Mill, Improved Bone Clamp, Improved Walking Heel, and Conn Pneumatic Tourniquet.

Diagnostic Equipment

W. A. BAUM CO, INC.
Booth I-20

Booth I-20 will exhibit the four latest models of the Lifetime Baumanometer. Doctors interested in infant, child, and leg-size bloodpressure cuffs will find a complete display. The firm will welcome the *opportunity to be of every service possible* in connection with your bloodpressure measurement problems.

BECK-LEE CORPORATION
Booth D-12

Years of research and experience have brought many advances in electrocardiographs On this, the centennial year of the A. M A, the Beck-Lee Corporation announce their new Model E Electrocardiograph The application gained through 33 years experience with quartz string electrocardiographs has been incorporated into this new instrument Those attending the convention will see the Model E on display.

CAMBRIDGE INSTRUMENT COMPANY, INC.
Booth C-17

At Booth C-17 will be exhibited the Cambridge "Simpli-Trol" Portable Electrocardiograph and *Portable Electrocardio-* ci, Cam- new Cam- recording Cambridge Plethysmograph which furnishes standardized, quantitative, and reproducible records of variations in the size of human extremities as determined by the state of fullness of the blood vessels.

THE DENVER CHEMICAL MFG CO, INC
Booth C-14

Galatest, for the instantaneous determination of urine sugar, and Acetone Test (Denco), for the detection of acetone in urine, will be exhibited You are cordially invited to visit this booth for demonstration of these "spot tests" for sugar and acetone Galatest and Acetone Test (Denco) offer advantages of accuracy, simplicity, and economy in routine urinalysis.

GASTRO-PHOTOR LABORATORIES CORP.
Booth I-28

Gastro-Photor Laboratories will feature their new 500 Model GASTRO-PHOTOR—"The Camera for photographing the Interior of the Stomach." This Camera has proven its true worth as an aid in diagnosing ulcers hidden within rugal folds, or in locations inaccessible to x-ray observations. Each Camera take, provides 16 gastrophotographs. Samples of actual gastrophotographs will be available for your observation.

GOODMAN-KLEINER CO, INC
Booth EP-21

Physicians treating marital infertility are invited to witness actual demonstrations of a new, portable apparatus for use in the diagnosis and treatment of female sterility —the Weisman GYNOGRAPH The Gynograph, in the office, clinic or hospital, performs singly or simultaneously, carbon dioxide tubal insufflation, hysterosalpingography, or a combined pneumoperitoneum and pelvic viscerography, under constant manometric observation.

JONES METABOLISM EQUIPMENT CO.
Booth H-24

The Jones Metabolism Equipment Company will exhibit and demonstrate the new Jones Motor Basal and Super Motor Basal Metabolism Units A staff of trained technicians will be on hand to give any help or information needed about any phase of metabolism testing.

KEYSTONE VIEW CO.
Booth A-13 (No. ½)

The Keystone View exhibit will feature several new developments in stereoscopic orthoptic equipment. Of especial interest at this time, the Keystone Stereo-Motivator, utilizing anaglyphs in a new approach to squint demonstrated. Also a with color-corrected improvements for vision testing and training will be shown

LAMOTTE CHEMICAL PRODUCTS COMPANY
Booth B-27

Among the new equipment to be shown at the LaMotte booth will be a New Liver Function Test which does not require prior *injection of material, a New Specific Gravity* Method for serum, and a New Micro Cholesterol Unit, as well as a new development in the serodiagnosis of syphilis. Also of interest to physicians in public health work will be the New LaMotte Field Unit for inspection of foodstuffs

SANBORN COMPANY
Booth B-11

At Booth B-11 you can see a complete Sanborn direct- watch the actual which is finished tant of recording. Also on display for inspection and demonstration is the *Instomatic Cardiette*, photographic type electrocardiograph News and complete information about the new Sanborn metabolism developments are also available

TAYLOR INSTRUMENT COMPANIES
Booth F-18

In the Tycos exhibit you will be interested in seeing an actual "Break-down Test Panel" in operation On this panel are mounted 10 Tycos Manometers which are being pulsated automatically to prove the durability and permanent accuracy of the Aneroid-type Tycos The display can be stopped and instruments checked by the observer

W. A. TAYLOR & COMPANY
Booth F-5

Their complete line of Comparators for colorimetric clinical chemistry will be displayed by W A Taylor & Company. Comparators employing simple, rapid, and accurate procedures for many tests are available Blood sugar, NPN, Urea Nitrogen, Thiocyanate, sulfa, icterus index, hemoglobin, chlorides and many other constituents can be determined quickly and easily in the physician's office with these Comparators.

Dietetic Products

AMERICAN CAN COMPANY
Booth I-18

Convention delegates are cordially invited to visit the American Can Company's exhibit in Booth I-18 where information will be available concerning those aspects of commercially canned foods which are of particular interest to the medical profession.

AMERICAN INSTITUTE OF BAKING
Booth D-4

A century of baking will be dramatized in this booth. By comparing baking practices of a century ago with today's modern, *mechanized bakery, this exhibit will depict* the enormous progress made by the baking industry from the days of Sylvester Graham to today's enriched white bread made according to standards approved by the Council on Foods and Nutrition.

BEECH-NUT PACKING CO.
Booth B-4

Beech-Nut Packing Company, which will feature its twenty strained varieties of Baby Foods and fourteen of Junior Foods, invites you to visit its exhibit Members of the nutrition staff will be on hand to answer any questions you might care to ask concerning the preparation exact ingre*dients, or nutritive* value of the Beech-Nut Foods.

THE BEST FOODS, INC.
Booth B-9

At their booth, The Best Foods, Inc, is *exhibiting Nucoa, the wholesome nutritious* vegetable margarine, which contains 15,000 units of Vitamin A to the pound Also on exhibit will be the famous Best Foods Hellmann's Real Mayonnaise and other Best Food's products. Miss Elsie Stark, Director of Consumer Education, will be in charge of the booth and will welcome questions about the products.

THE BORDEN COMPANY
Booths E-4, E-6, E-8

Items in the Borden exhibit will include not only special prescription products for infant feeding, but also foods for older children and adults Several new powdered foods for well-rounded nutrition will be featured, in addition to Borden's widely-acclaimed soluble coffee, cheese, milk and ice cream. Stop at Borden's for a refreshing snack The Borden Company this year is celebrating its 90th anniversary.

CARNATION COMPANY
Booth K-7

In this exhibit you will see an attractive display on Carnation Evaporated Milk—"the milk *every doctor knows*" Some valuable information on its use for infant feeding, child feeding, and general diet,

on internal medicine, antibiotic therapy, surgery, and operative technic. The Appleton-Century representatives will also be glad to supply advance information on several other new titles in preparation for early publication.

THE BARTA PRESS

Booth G-27

Illuminated, colored enlargements of anatomical and schematic illustrations, and of kodachrome photographs feature the display of The Barta Press, Medical Division. Subjects range from the eye fundus to proctoscopic studies of internal hemorrhoids. Treatises, brochures, charts, booklets, folders, and other forms of printed literature produced for ethical medical advertisers, are also shown.

THE BLAKISTON COMPANY

Booth A-3

The unique display of new books by Blakiston will include the official American Medical Association's 1947 edition of "Standard Nomenclature of Disease and Standard Nomenclature of Operations" now published by Blakiston; Dyke's "Recent Advances in Clinical Pathology"; Merritt, Mettler and Putnam's "Fundamentals of Clinical Neurology"; Dr. Alexander Joe's "The Acute Infectious Fevers"; Alexander Fleming's "Penicillin. Its Practical Application"; and many others.

COLWELL PUBLISHING CO.

Booth G-2

Physicians and guests interested in income and expense records, or standard forms for patients' histories and accounts, may study the DAILY LOG for Physicians, and discuss their particular problems. DAILY LOG users will find the cowhide flat-opening ring binder available again for the first time in five years.

THE COOPERATIVE MEDICAL ADVERTISING BUREAU

Booth EP-11

This exhibit will have on display copies of the 35 State Medical Journals, members of the Bureau, all of which follow AMA standards in acceptance of advertising. Service as rendered in behalf of the state medical associations will be outlined. Prospective advertisers may secure sample copies, details, rates. Ask for booklet, "Advertising Service."

F. A. DAVIS COMPANY

Booth H-16

Of interest to all physicians will be the "Cyclopedia of Medicine, Surgery and Specialties" edited by Dr. George Morris Piersol and Dr. Edward L. Bortz. In addition to their standard line of texts, F. A. Davis plan to display the new Behrend "Diseases of the Gall Bladder"; Bach "Arthritis"; Greenbaum "Dermatology"; Judd "Diseases of the Chest"; Malinaic "Rhinoplasty"; May "Reconstructive Surgery"; and Troncoso "Gonioscopy."

GRUNE & STRATTON, INC.

Booth A-4

New books on display by G & S are Schindler's "Gastritis," Mandl's "Paravertebral Block," Fradkin's "Diarrheal Diseases," Rubinstein and Davis' "Neuroanatomical Atlas," and Behrman's "Dermatologic Clues." In addition to outstanding and practical monographs and reference works, the new PROGRESS volumes, Meigs and Sturgis' "Progress in Gynecology" and Speigel's "Progress in Neurology and Psychiatry" (2nd volume, 1947) are shown. In the periodical field, two monthly Abstracts have been added.

PAUL B. HOEBER, INC.

Booth A-26

Among the new books to be on display by Paul B. Hoeber, Inc., Medical Book Department of Harper and Brothers, are Mengert's "Postgraduate Obstetrics," Elman's "Parenteral Alimentation in Surgery," and Kardiner's "War Stress and Neurotic Illness." Advance proofs of New Editions of Gesell's "Developmental Diagnosis" and Bierman's "Physician Medicine in General Practice" and a new book, Beach's "Hormones and Behavior" will be available for your perusal.

LEA & FEBIGER

Booth A-18

Lea & Febiger will exhibit both new works and new editions of standard books. They will include Holmes & Robbins' "Roentgen Interpretation"; Schwartz, Tulipan & Peck's "Occupational Diseases of the Skin"; Stimson's "Common Contagious Diseases"; Bell's "Pathology"; Soffer's "Diseases of the Adrenals"; Joslin's "Diabetes Mellitus"; Cushny's "Pharmacology & Therapeutics"; Lewin's "Foot and Ankle"; Ballenger's "Nose, Throat and Ear"; Wintrobe's "Hematology."

J. B. LIPPINCOTT COMPANY

Booths A-20, A-22, A-24

J. B. Lippincott Company, Philadelphia, Montreal, London, is pleased to present at this 100th Anniversary celebration of the American Medical Association, a brilliant display of new books and new editions in the field of medicine and surgery, including items especially prepared for this Centenary meeting.

THE MACMILLAN COMPANY

Booth B-25

Anticipating the *second* hundred years of medical progress, Macmillan will present publications of interest to both the teacher and the practitioner of modern medicine. Among those books of current and future interest will be: Lewis—"Diseases of the Heart," 4th edition; Levine— "Psychotherapy in Medical Practice"; and the forthcoming Riseman—"P-Q-R-S-T, A Guide to Electrocardiogram Interpretation"; Walter—"Aseptic Treatment of Wounds"; Goldwater—"On Hospitals" and others.

THE C. V. MOSBY COMPANY

Booths J-21 and J-23

A wealth of new medical literature will be shown by Mosby this year. New titles will include Clendening-Hashinger "Methods of Diagnosis," Treiger "Atlas of Cardiovascular Diseases," Ackerman-Regato "Cancer," Rubin "Uterotubal Insufflation," Wiener "Skin Manifestations of Internal Disorders," Sadler "Mental Mischief and Emotional Conflicts," and Weinmann-Sicher "Bone and Bones." For something new and different in surgery, inquire about the forthcoming 9-volume "British Surgical Technic."

THOMAS NELSON & SONS

Booth I-21

Thomas Nelson & Sons will exhibit their Medical Books in a convenient manner. Each set of books will be encased in a modern, natural-oak bookcase. These bookcases will rest upon a wide jet-black reading ledge which is illuminated by indirect fluorescent lighting. This practical exhibit will permit easy examination and handling of the loose-leaf volumes.

OXFORD UNIVERSITY PRESS, NEW YORK, INC.

Booth C-28

The Oxford University Press extends a cordial invitation to physicians to visit booth C-28 where all Oxford publications along with the following new books will be on display; Jorpes, Heparin; Movitt, Jaundice; Jackson & Parker, Hodgkin's Disease; Wolff, Headache; Pack & Twombly, Symposium on Endocrinology; Duncum, Anesthesia; Peel, Diseases of the Heart; Hinshelwood, Chemical Kinetics of Bacterial Cell.

W. F. PRIOR, INC.

Booth C-16

When Prior launched a plan in 1918 to publish medical reference books that could be kept forever up-to-date it seemed too good to be true. But the test of time has proved their ideal has been achieved and has made them thousands of friends among doctors. You are cordially invited to visit this booth to express comments and suggestions for future publications.

W. B. SAUNDERS COMPANY

Booths A-12, A-14, A-16

Saunders—the publishers of the Centenary Volume giving the History of the American Medical Association—will display in a wall panel the progress of the making of this book from manuscript to bound copy. This unusually attractive exhibit will also include new books and interesting new editions, among them: Hyman's 5-volume "Integrated Practice of Medicine"; Rubin's "Diseases of the Chest and X-rays"; Cooke's "Allergy", Spies' "Rehabilitation through Nutrition"; Bockus' "Gastroenterology."

SURGERY, GYNECOLOGY AND OBSTETRICS

Booth D-31

An interesting exhibit, portraying the character and quality of an acknowledged leader in surgical journals, is depicted at Booth D-31. Superior printing, beautiful illustrations, and high editorial standards are graphically portrayed through "Translites" in this exhibit.

CHARLES C THOMAS, PUBLISHER

Booth B-17

Located near the main entrance, the feature of Charles C Thomas Publisher's exhibit will be forty-two new titles, editions, and printings published since the last meeting. Of particular interest will be the announcement of two new journals: "The Journal of the Neurological Sciences" and "Pediatrics." A unique innovation in medical publications, the *AMERICAN LECTURE SERIES* will be displayed for the first time.

UNIVERSITY OF CHICAGO PRESS

Booth K-5

The exhibiting of Books from University Presses is an outgrowth of the Association of American University Presses. Each press represented is a separate publishing company devoted to the production of important technical and scholarly works which might otherwise go unpublished, as well as general books of vital interest. Because of their common goals, and because some are too small to sponsor exhibits alone, these presses have combined to present their books in a single display.

THE WILLIAMS & WILKINS COMPANY

Booth B-15

The Williams & Wilkins Company will display for the first time several new books and new editions, as well as their 20 medical journals including two new ones: "Obstetrical & Gynecological Survey," and "Plastic & Reconstructive Surgery." See also the new world-wide medical abstract service, "Excerpta Medica," covering all fields of medicine and surgery.

THE YEAR BOOK PUBLISHERS, INC.

Booth J-8

Spies' "Experiences with Folic Acid," Potter's "Rh," "Sulzberger & Baer's "Office Immunology (Including Allergy)," Cullen's "Anesthesia in General Practice," Caffey's "Pediatric X-ray Diagnosis," Schiff's "Jaundice," and many new editions of general-practice-manu [illegible] 1946 YEAR [illegible] numerous tim [illegible] which every physician is cordially invited to peruse in Booth J-8.

Office Furniture

W. D. ALLISON COMPANY

Booth F-17

The W. D. Allison Company's exhibit this year will be located in Booth F-17. Features of the exhibit will include a suite of "Monarch" physician's furniture; the *Allison-Hanes Rectal Table; and the Allison-Ramsey Pediatric Table.*

HAMILTON MANUFACTURING COMPANY

Booths L-2, L-4

The first booth to your left, as you enter the auditorium, is that of the Hamilton *Manufacturing Company* where is shown a complete Nu-Tone Walnut Suite and a complete Steeltone Suite. *A special feature of the exhibit will be demonstrations of the* newly designed all-purpose table. The top *of this table is adjustable to any of the* standard examining positions.

SHAMPAINE COMPANY

Booth C-25

Shampaine will display the Perfection Major Operating Table, completely head-end controlled and containing many new features. Also exhibited will be the renowned Martin All-purpose Table; the Steelux Physician's Office Furniture; and reception room furniture designed for use in doctors' offices. Factory trained representatives will be on duty and will be happy to demonstrate and discuss this equipment.

Pharmaceuticals

AMES COMPANY, INC.

Booth E-3

Representatives will demonstrate Clinitest, Albutest, and Hematest—simplified tests for the detection of urine-sugar, albumin, and occult blood—at the Technical Exposition of the 100th Anniversary of the American Medical Association. They will also be glad to discuss Decholin and Decholin Sodium.

ARMOUR LABORATORIES

Booths C-9, C-11, C-13

The Armour Laboratories will present historical data and graphic sketches of important events which lead to our present understanding of thyroid function, standardization of thyroid preparations, and dependable treatment of simple colloid goiter, myxedema, cretinism, and other dysfunctions of the gland. Do not miss the scientific exhibit display (Space 74) and the motion picture "Animated Hematology."

BILHUBER-KNOLL CORP.

Booth D-9

The Bilhuber-Knoll display carries the *fine medicinal* chemicals Bromural—sedative and mild hypnotic; Dilaudid—analgesic and cough sedative; Metrazol—analeptic and antianoxiant; Theocalcin—diuretic and myocardial stimulant; and other dependable council-accepted products. Your discussions on the latest developments in these fine prescription chemicals will be welcomed.

GEORGE A. BREON & COMPANY

Booth D-10

The George A. Breon Company exhibit will feature a lighted fountain bubbling from a vine covered wall. Busy conventioneers will find it a comfortable retreat for a moment of relaxation.

BRISTOL LABORATORIES, INC.

Booth C-26

The Bristol Laboratories' exhibit will be devoted to the display of penicillin and pharmaceutical products. *Qualified representatives will be on hand to assist the medical profession with any inquiries.* Literature describing Bristol products will be available.

BURROUGHS WELLCOME & CO., INC.

Booths G-14, G-16

Burroughs Wellcome & Co., Inc., will present a series of interesting panels depicting the background and development of two of its most important products—Digoxin and Globin Insulin. A hearty invitation is extended to all to visit this exhibit.

CHURCH & DWIGHT CO., INC.

Booth I-19

Church & Dwight Co., Inc., in booth I-19 will pay tribute to the 100th Anniversary of the A. M. A. This firm with one hundred and one years of service to the medical profession was an industrial infant of 1 year of age when the A. M. A. was born in 1847; and throughout a century of growth, development, and experience, have continuously supplied the medical profession with Pure Bicarbonate of Soda.

CIBA PHARMACEUTICAL PRODUCTS INCORPORATED

Booth B-8

Ciba Pharmaceutical Products, Inc., invite physicians to visit their exhibit for the latest information on PYRIBENZAMINE, the new antihistaminic compound. Also displayed will be PRIVINE HCl, the effective, *long-lasting nasal vasoconstrictor.* Representatives in attendance will be glad to answer any questions which you may have concerning these products and to furnish you with literature and samples.

COMMERCIAL SOLVENTS CORP.

Booth E-24

The modern-day penicillin armamentarium is to be featured: Crystalline Penicillin G Potassium Salt, Crystalline Penicillin G Sodium Salt, Crystalline Penicillin G Potassium in Oil and Wax, and Tablets Buffered Penicillin. Descriptive literature covering these preparations will be available, outlining the principal uses and dosages.

COUNCIL ON WHITE MINERAL OIL

Booth E-12

The doctor's home medicine chest will benefit by his souvenir from the booth of the Council on White Mineral Oil. He may take his pocket-size sample with him, or the Council will mail it to his address. The background of the booth will highspot 8 advantages of mineral oil, with supporting quotations from well-known physicians.

CUTTER LABORATORIES

Booths E-18, E-20

Paralleling the hundredth anniversary of the A. M. A. is the historical exhibit of Cutter Laboratories, which depicts the progress made in the last century in pediatric immunology and in the utilization of human blood. Successive pages in an eight-foot book which dominates the Cutter display show significant advances against diphtheria, pertussis and tetanus; the final section is devoted to the fractionation of human blood, one of the highlights of the past decade.

DAVIES, ROSE & COMPANY, LIMITED

Booth H-28

Visit booth H-28 for the latest word on the Quinidine Sulfate situation. The availability of Quinidine Sulfate Tablets has been a perplexing problem for physicians and cardiac clinics, as the Government had to restrict the purchase of the salt and the sale of the tablets during the war because of enemy occupation of Java, which is the principal source of Cinchona Bark from which natural Quinidine is derived.

THE DRUGS PRODUCTS CO., INC.

Booth I-3 (E ½)

This year Drug Products which enters its 35th year of service to the medical profession will have on hand trained representatives to discuss the many Council-accepted products in their line. You and your guests *are cordially invited to stop in.*

DUREX PRODUCTS, INCORPORATED

Booth F-27

Durex which this year celebrates its 20th anniversary will exhibit it's contraceptive products—Lactikol Jelly and Lactikol Creme, which have been developed during this period. Coupled with these are the usual type of plunger applicator and the recently developed Metri-Dose applicator, which is a new syringe type applicator for measured dosages, adjustable from 5 to 8 cc.

EATON LABORATORIES, INC.

Booths D-14, D-16

Eaton Laboratories, Inc., will exhibit *several pharmaceutical preparations of interest to the physician.* Furacin Soluble Dressing containing a new chemotherapeutic agent, Furacin (brand of nitrofurazone), will be displayed. This compound is a new antibacterial agent for the treatment of wound and surface *infections.* Clinical evaluation throughout the past two and one-half years indicates a wide field of use.

ENDO PRODUCTS, INC.

Booth H-18

In keeping with the historical significance of the A. M. A. centennial meeting, the Endo booth will depict an early American pharmacy. [illegible] will be on hand to [illegible] acquaintances and to [illegible] their products. [illegible] selective [illegible] *d Estro-* [illegible] *be dis-*tributed.

HOFFMANN-LA ROCHE, INC.

Booth C-15

Prostigmin has assumed a very important role in the practice of medicine and surgery *today. For this reason Roche will feature* it at their unusually attractive Centennial Convention booth. To their medical friends, they extend a cordial welcome to visit the

HOLLAND-RANTOS COMPANY, INC.

Booth C-23

At the Holland-Rantos Booth will be displayed the nationally known and universally used Koromex contraceptive specialties. Be sure to see the new Koromex Set Complete, which is a package combining the necessary items for complete contraceptive technic. Samples of Koromex Jelly will be available, as will be copies of the new physician's patient instruction chart.

HOLLISTER-STIER LABORATORIES

Booth E-14

100 years ago allergy was practically unknown. Today it is an important part of medical practice. A visit to the Hollister-Stier Laboratories' booth will acquaint you with what is new, and explain how much a laboratory specializing exclusively in the field of allergy can aid you in your practice.

HYNSON, WESTCOTT & DUNNING, INC.

Booth D-26

Hynson, Westcott & Dunning, Inc., will feature their pharmaceutical specialties. There will also be a display of diagnostic apparatus and ampule solutions which have been developed in cooperation with physicians. Representatives of the company will be present to demonstrate and to provide information regarding these products. Literature will be available to physicians who are not already familiar with products exhibited.

INTERCHEMICAL CORPORATION

Booth L-3

The Biochemical Division of Interchemical Corporation will display AMINO ACIDS—I. C. Representatives of the scientific staff will be available at Booth L-3 for discussion of laboratory and clinical amino acid research. Physicians are cordially invited to meet them and exchange views on the potential usage of amino acids in nutrition.

INTERNATIONAL VITAMIN CORPORATION

Booth C-24

At the I. V. C. Booth there will be a full array of Council-accepted vitamin products. An especially interesting Vitamin "A" configuration will be shown in color transparency. Well-trained representatives and an M.D. will be in attendance at all times to describe and explain the uses of I. V. C. products.

LAKESIDE LABORATORIES, INC.

Booths D-1, D-2

The Lakeside exhibit will feature Mercuhydrin, well tolerated mercurial diuretic; Estrogens, Lakeside; and Emulgen, emulsifying vehicle for penicillin. Representatives will be on hand to describe the applications of these medications.

LEDERLE LABORATORIES, INC.

Booths J-10, J-12

Therapy through Research will be the theme of the Lederle exhibit. This will be illustrated by the development of folic acid and its uses in the treatment of macrocytic anemias. Across the center front of this large exhibit will be a series of illustrations and photographs so arranged that physicians can most easily examine the new products of research.

ELI LILLY AND COMPANY

Booths G-18, G-20, G-22

Exhibits on diabetes and the anemias are presented to conform to the historical keynote of the Centennial meeting. These displays present a series of translite panels telling the story of diabetes and the anemias through the ages and the modern conquest of these disorders.

MALLINCKRODT CHEMICAL WORKS

Booth A-1

The Mallinckrodt Chemical Works cordially invites all members of the American Medical Association and their friends to visit Booth A-1. The representatives in attendance will be glad to answer questions concerning the chemicals on display or any problems relative to the medicinal line of chemicals as supplied by the Mallinckrodt Chemical Works.

THE MALTINE COMPANY

Booth H-22

Thromboplastin, a new product from the Research Laboratories of The Maltine Company, is featured at the Maltine exhibit. This product is an improved and standardized thromboplastin for diagnostic purposes and its use makes possible prothrombin determinations of greater accuracy. Prothrombin determinations aid in detecting an increased tendency to hemorrhage or to thrombosis.

McKESSON & ROBBINS, INC.

Booth D-15

A display of accepted vitamin products and of historical data showing development of the House of McKesson since 1833 will be featured here. Some of the modern laboratory procedures will be demonstrated.

MEAD JOHNSON & COMPANY

Booth A-8

Don't miss the outstanding display of Famous Medical Caricatures at Mead Johnson & Company's Booth A-8. "Medical caricatures show us medicine, its evolution, its discoveries, and its failures from the standpoint of the patient, medicine as seen by the sick."

MERCK & CO., INC.

Booths C-18 and C-20

The Merck exhibit will feature important developments in medical progress, including such products as Quinine, Arsenicals, Vitamins, Sulfonamides, Penicillin, and Streptomycin. Pay a visit to the Merck display—Booths C-18 and C-20. The representatives in attendance will be at your service.

THE WM. S. MERRELL COMPANY

Booth I-26

This "pioneer pharmaceutical house," closely identified with progress in prescription medicines since 1828, presents its exhibit as a salute to the A. M. A. Centennial and to the frontier "Saddle Bag Doctor" of 100 years ago. Special attention is called to several of the many contributions to medical science which the Merrell Company has made since the birth of the American Medical Association.

THE NATIONAL DRUG COMPANY

Booth I-23

Products on display at the National Drug exhibit will be their time-tested, Council-accepted biologicals, together with the newest developments of their research laboratories in both the biological and pharmaceutical fields. Of special interest will be the series of multiple antigens for simultaneous immunization. Trained representatives will be available for discussion.

NOVOCOL CHEMICAL MFG. CO., INC.

Booth F-29 (E ½)

Your visit through the exhibits would hardly be complete if you did not stop at Booth F-29. Here will be displayed the new, safe, potent local anesthetics, MONOCAINE HCl and MONOCAINE FORMATE—the latter for spinal anesthesia and caudal analgesia. There will also be a complete exhibit of the popular cartridge known as the ANESTUBE. You are cordially invited.

ORTHO PHARMACEUTICAL CORPORATION

Booths I-31, I-32

The Ortho Pharmaceutical Corporation cordially invite physicians to visit its exhibit where their complete, well-known line of conception control products will be shown. Complete information and literature will be available. Special requests will be given prompt attention.

PARKE, DAVIS & COMPANY

Booths F-9, F-11, and F-13

The 1947 Parke, Davis & Company exhibit will highlight the technical aspects of BENADRYL. Demonstrations of the fundamental uses of radioactive isotopes in medical research and their applicability to the study of the pharmacodynamic action of BENADRYL will be depicted. Photographs in color will illustrate the use of BENADRYL in urticaria, hay fever, eczema, and smooth muscle spasm associated with allergies.

THE E. L. PATCH CO.

Booth C-5

To any physician concerned with the treatment of functional constipation, The E. L. Patch booth, C-5, will hold a special attraction. On display will be the Three Types of Kondremul—Plain; with Cascara; and with Phenolphthalein. You won't want to miss this interesting exhibit.

PERM-ASEPTIC CORPORATION

Booth H-2

An exhibit of particular interest will be that of PERM-ASEPTIC, the new antifungal and antibacterial chemical developed during the war and used by many laundries. Superintendents and heads of hospitals especially will want to learn more about this colorless, odorless, preservative which gives service and protection to linens, diapers, etc. You are cordially invited to stop by and become acquainted with PERM-ASEPTIC'S many other uses.

PREMO PHARMACEUTICAL LABORATORIES

Booth K-1

Introducing a refinement in the application of penicillin in oil and wax, the modernistic exhibit of Premo Pharmaceutical Laboratories graphically underlines Premo's contemporary contributions to the administration of penicillin. Medical service representatives are in attendance to demonstrate Premo's adaptations and methods. Literature is available on Premo's latest laboratory research and developments.

RARE CHEMICALS, INC.

Booth J-25

The male hormone—testosterone propionate for parenteral use—will be the main feature of Rare's exhibit. Other products to be included are the new skin detergents, Acidolate (nonlathering liquid) and Dermolate (lathering cake); Gitalin, digitalis glycoside; and Salysal, the salicylate which requires no alkali.

WM. H. RORER, INC.

Booth I-27

This year, the exhibit of William H. Rorer, Inc., offers a display of "Rorer" Council-accepted products. These include Mannitol Hexanitrate "Rorer," vasodilatory agent widely used in cardiovascular therapy, as well as other preparations of current therapeutic interest, notably Thiouracil "Rorer," Sulfadiazine "Rorer," and Diethylstilbestrol "Rorer." Full professional data on these products will be gladly supplied by the Rorer representative.

SANDOZ CHEMICAL WORKS, INC.

Booth F-26

For the non-narcotic relief of migraine, physicians will be interested in Gynergen (Ergotamine tartrate); also featured are: Digilanid, a combination of the pure crystalline Lanatosides A, B & C; Scillaren and Scillaren B, containing the cardiodiuretic principles of squill—these cardioactive glycosides are standardized gravimetrically; and Sandoptal, an effective hypnotic and sedative.

SCHERING CORPORATION

Booth I-16

In endocrinology, progress has been recorded since the time of Aristotle's empiric observations of the effects of castration. Within the past century many important scientific contributions in rapid succession have added to the history of the sex hormones. At the Schering booth is shown "The Genealogy of the Sex Hormones," the family tree, and history of the isolation and synthesis of the potent sex hormones.

SCHIEFFELIN & CO.

Booth H-13

Schieffelin Benzestrol, a non-stilbene synthetic estrogen, developed in the research laboratories of Schieffelin & Co., will be featured. A qualified staff will be in attendance to explain the advantages of this product, and to answer questions with regard to other Schieffelin specialties.

JULIUS SCHMID, INC.

Booth G-17

Visitors to the new exhibit of Julius Schmid, Inc., will see the RAMSES Prescription Packet No. 501 displayed for the first time at any convention of the American Medical Association. Recently made color photographs which established the barrier value of RAMSES Vaginal Jelly will also be shown, as will other reproductions in color of special interest to physicians.

G. D. SEARLE & CO.

Booths E-13, E-15

The Searle exhibit will display many Council-accepted products of Searle Research. Featured will be Searle Aminophyllin including Aminophyllin Supposicones, the Searle brand of Aminophyllin Suppositories which remain stable at temperatures up to 130 F., but which liquefy readily under conditions of use; Metamucil, a modern concept in the treatment of constipation; and Diodoquin, the effective amebacide.

SHARP & DOHME, INC.

Booths B-18, B-20, B-22

This year's display of Sharp & Dohme features a demonstration of the production steps involved in the manufacture of virus vaccines. The antibiotic, tyrothricin, and the sedative and hypnotic, 'Delvinal,' are featured also along with the sulfa drugs—'Sulfasuxidine' and Sulfamerazine. Capable informed representatives including members of Sharp & Dohme's research staff are present at all times.

CARROLL DUNHAM SMITH PHARMACAL COMPANY

Booth A-13 (S ½)

This exhibit will present the new drug, BISTRIMATE (Smith), which is orally effective and well tolerated in systemic bismuth therapy. Detailed information on chemical structure, bismuth excretion studies, and clinical histories, will be portrayed.

SMITH, KLINE & FRENCH LABORATORIES

Booths EP-7, EP-7A, EP-8

S. K. F.'s antique drug store, an authentic 1793 apothecary's shop—complete with botanicals and galenicals, patent medicines and nostrums—is exhibited by Smith, Kline & French Laboratories. On workbench and counter are numerous 18th century pharmacist's tools, including a tooth extractor and a bleeder. Despite its obsolete equipment, visitors will quickly note the family resemblance to the prescription department of a modern drug store.

E. R. SQUIBB & SONS

Booths F-10, F-12, F-14, F-16

Nutrition in the Sick—A series of panels depicting the daily nutritional requirements of a typical hospitalized patient, daily deficits in nutritional intake, daily protein and vitamin losses by excretion, certain pathological results of such deprivation, and suggestions for prompt restoration of nutritional balance will be dramatized in the Squibb exhibit.

FREDERICK STEARNS & COMPANY

Booths F-6, F-8

Frederick Stearns & Company Division is featuring their Parenamine (Amino Acids, Stearns) which is a mixture of amino acids derived from the acid hydrolysate of casein fortified with pure dl-tryptophane *to the extent of 1% of the total amino* acids, also Neo-Synephrine Hydrochloride products, Appella Apple Powder, and Gastric Mucin. The professional staff will be in attendance to discuss these products.

MARVIN R. THOMPSON, INC.

Booth EP-15

Marvin R. Thompson, Inc., in accordance with their established policy of rendering useful "Service to Medicine" will provide the latest news bulletins as they come off the direct associated press wire in the comfortable MRT lounge, located in the far eastern section of the Technical Exhibit. A. M. A. members and guests are cordially invited to drop by for a rest, a smoke, and the latest news.

U. S. VITAMIN CORPORATION

Booth L-6

Highlighting this exhibit will be enlarged color photographs of common signs of nutritional deficiency including Bitot's spots, follicular hyperkeratosis, beriberi heart, pitted edema, glossitis, cheilosis, pellagrous dermatitis, gingivitis, rickets, pyridoxine anemia and others. Complimentary copies of the illustrated brochures "Diagnosing Vitamin Deficiencies," "Vitamin Manual for Physicians," and other educational material will be distributed.

THE UPJOHN COMPANY

Booths J-17, J-19

The Upjohn Company exhibit outlines in [illegible] d unusual manner the [illegible] clotting. It deals with [illegible] as a sort of biologic [illegible] Gelfoam (a tissue absorbable sponge) as a hemostatic agent, and the clinical use of the natural anticoagulant, Heparin.

VARICK PHARMACAL CO., INC.

Booth F-24

[illegible] ıanufactur- [illegible] s an inter- [illegible] it at the [illegible] full-color [illegible] diac specimens and photomicrographs of cardiac pathology will be displayed, as well as interesting electrocardiograms. Arrangements are also being made to reproduce phonographically heart sounds of various valvular lesions.

WALKER VITAMIN PRODUCTS, INC.

Booth B-7

This firm is using a new modern exhibit which enables it to effectively present its line of Council-accepted Vitamin Tablets, Capsules, and Injectable Solutions. Experienced representatives in attendance will be qualified to discuss all phases of vitamin therapy.

WALLACE LABORATORIES, INC.

Booth H-12

New treatment for acne vulgaris, Intra*derm Sulfur Skin Penetrant Solution* will be presented by Wallace Laboratories, Inc. This new treatment for acne vulgaris incorporates the intraderm principle of follicle penetration which will be demonstrated at the Wallace exhibit.

WALLACE & TIERNAN PRODUCTS, INC.

Booth B-3

W & T is exhibiting AZOCHLORAMID, a stable and highly bactericidal chloramine for wet dressings, hot soaks and irrigations; MONOMESTROL, a synthetic estrogen, orally effective and comfortably tolerated by the patient; and DESENEX, a potent, yet non-irritating fungicide. You are cordially invited to visit our exhibit. We will welcome inquiries about our products.

WILLIAM R. WARNER & CO., INC.

Booth D-24

In view of medical interest in histamine and antihistaminics, the research laboratories of William R. Warner & Co., Inc., have been investigating their action and effects. A series of photographs and charts have been prepared which depict the physiologic effects of these preparations on the animal body. The presentation includes studies on the alimentary tract, circulatory and respiratory systems.

THE WARREN-TEED PRODUCTS COMPANY

Booth E-22

"Warren-Teed" in eight inch, red Lucite letters tops a five unit display in gleaming white, trimmed in red. The entire display is illuminated by indirect lighting and two of the units contain translite pictures of scenes in the Warren-Teed laboratories and manufacturing departments. Council-accepted products will be on display.

WHITE LABORATORIES, INC.

Booths G-11, G-13, G-15, L-10, L-12, L-14

White Laboratories, Inc., presents ethically promoted pharmaceutical specialties for your consideration and discussion. White's Cod Liver Oil Concentrate Products and other Council-accepted vitamin products are on display. This company pioneered in vitamin research, and the same progressive scientific spirit has been maintained in the manufacture of all White's products. Your visit to White's Exhibit will meet a cordial welcome.

WINTHROP CHEMICAL COMPANY, INC.

Booths A-17, A-32, B-31, B-32

Winthrop's main display consists of colored models by Dr. Justus F. Mueller showing causative agents of all principal tropical diseases. Of particular interest are models of various forms of malarial parasites. The complete malarial cycle is reproduced, including the recently discovered exoerythrocytic (tissue) phase of the cycle. A part of the exhibit devoted to anesthesia and continuous caudal analgesia is illustrated by full color transparencies of paintings by Leon Schlossberg. Complimentary prints of "Anesthesia 100 Years Ago" are offered to physicians.

Surgical Supplies

BAUER & BLACK
Booth K-13

This exhibit will feature the use of KERLIX cloth, an interesting new gauze which contains a permanent crinkle and has softness, fluffiness, and resiliency not possible with regular gauze. The company will show how its mild elasticity makes it particularly suitable for head, knee, elbow, stump and compression dressings.

DAVIS & GECK, INC.
Booth EP-1

Davis & Geck, Inc., manufacturers of sterile surgical sutures will, through the facilities of the D & G Surgical Film Library conduct a program of surgical motion pictures. The Library, founded in 1928, presented its first showing at the A. M. A. Convention in Atlantic City in 1929. It now includes over three hundred subjects including films on nearly every phase of surgical procedure.

DAVOL RUBBER COMPANY
Booth 129 (W ½)

Davol Rubber Company will display samples of many of the surgical and essential health items which presently are being supplied. They will display and demonstrate also the Constant Traction Dressing, the new type suture that has been favorably received by the profession.

ETHICON SUTURE LABORATORIES
Booths WP-12, WP-13, WP-14

Ethicon Suture Laboratories will show the motion picture "Anomalies of the Bile Ducts and Blood Vessels; Strictures of the Common Duct"—Warren H. Coles, M.D., Chicago, Professor of Surgery and Head of the Department, University of Illinois Medical College, and Associates—produced by the American College of Surgeons.

MEDICAL FABRICS, INC.
Booth D-3

Medical Fabrics, Inc., exhibiting at Booth [illegible] ation bandage [illegible] e Elastic Ad- [illegible] suggested for [illegible] application of Elastic Adhesive. You are cordially invited to visit this exhibit.

SURGITUBE PRODUCTS CORP.
Booth I-25 (W ½)

New kodachrome transparencies showing SURGITUBE in 12 various positions will highlight this exhibit. SURGITUBE, a new seamless gauze fabric in tubular form, makes a neat, comfortable, flexible bandage; and because of its ease of application and removal, it may be economically used on all extremities with a great saving of time.

Special Apparel

S. H. CAMP & COMPANY
Booth G-9

A s[illegible] nsparencies depict[illegible] before and after [illegible] entific supports [illegible] l available throug[illegible] mp Institute for Better Posture will be displayed. Experts in attendance will answer questions pertaining to the scientific application of anatomical supports and advise regarding the availability of them in Authorized Service departments of stores throughout the country.

CONFORMAL SHOE COMPANY
Booth D-11

The Conformal Shoe Co., a division of the International Shoe Company, St. Louis, is sponsoring a special exhibit. The display illustrates how the Conformal shoe achieves snug custom fit and balanced support for each individual foot with its special patented plastic insole.

J. EDWARDS & COMPANY
Booth WP-5

You won't want to miss the very interesting display of children's shoes by J. Edwards & Company. The exhibit will show shoes for children of all ages from babies to "teen agers" and will include pre-walking, first steps, dress, and school shoes. Edwards' shoes for children have been made in Philadelphia since 1900. A special group of shoes for weak ankles, pronations, etc., will also be on display.

SPENCER, INCORPORATED
Booth E-7

The Spencerflex for Men—a new functional support design [illegible] est; like all Spencer [illegible] vidually designed. [illegible] Spencer Breast Forms. [illegible] mastectomy to improv[illegible] ance and mental attit[illegible] used by physicians to aid sacroiliac disturbances, visceroptosis, hernia, and many other conditions are also featured.

THE SPIRELLA COMPANY, INC.
Booth H-30

Spirella Foundation Garments present an entirely new and different method of corsetry designing. The unique Spirella method includes the use of exclusive Modeling Garments which are adjusted to the patient to give just the degree of support desired. Then measurements are taken of the supported figure and the patient's Spirella is individually made to exact specifications.

THE VANTA COMPANY
Booth WP-16

VANTA garments for infants offer layette items without pins or buttons and for toddlers, Self-Help garments, all of which will be exhibited in Booth WP-16. Originator oth the Tie Vest, Sun Suit, K-band, Baby Bess hose and other important features, VANTA will show No-Fas-Ning shirts and the latest developments in proper clothing.

Toilet Preparations

ALMAY, INC.
Booth F-23

Almay will present at Booth F-23 their new "Super-Milled" Face Powder in a feast of exciting new shades. By the elimination of aniline colors, Almay has succeeded in lowering to an irreducible minimum the sensitizing index of this new and [illegible] Powder (available [illegible] Visit the Almay Booth for other interesting developments.

DUKE LABORATORIES, INC.
Booth D-13

Duke Laboratories, Inc., will have on display Elastoplast, cotton-woven, adhesive surfaced, stretchable bandage; Mediplast compresses (sterilized and individually wrapped); Nivea Creme; Nivea Skin Oil; and Basis Soap—The Prescribers' Cosmetics.

LUZIERS, INC.
Booth A-30

Luzier's Fine Cosmetics and Perfumes, as advertised in publications of the American Medical Association, will be on exhibit in Booth A-30. The Luzier formulas are selected to suit individual cosmetic requirements and preferences and may be modified to suit allergies. Luzier officials will be in attendance to explain in detail the nature of this service.

MARCELLE COSMETICS, INC.
Booth E-17

The Marcelle booth will feature hypoallergenic cosmetics, formulated scientifically for those with sensitive skin and for the allergic person. Mr. Philip L. Blazer, President, and members of the organization, welcome discussions with physicians on the cosmetic needs of the medical profession. Available to allergists, dermatologists, and all physicians interested in allergy, are formularies, brochures and cosmetics.

G. H. PACKWOOD MFG. CO.
Booth WP-10

Paxlanosav Heavy Duty Granulated Skin Cleanser for industrial use will be presented in booth WP-10. Here it will be shown how this Heavy Duty cleanser has been a successful factor in helping to protect worker's hands against infections nad irritations that impair efficiency. Its bounteous lather, exceptional cleansing speed, economical bulk, and other desirable qualities will be of particular interest.

THE PROCTER & GAMBLE COMPANY
Booth J-14

Proctor & Gamble offers the first four of a series of time-saving leaflet pads for doctors.—"Instructions for Routine Care of Acne"; "Instructions for Bathing a Patient in Bed"; "Instructions for Bathing Your Baby"; and "The Hygiene of Pregnancy." Additional pads designed to save doctors' time in answering patients' questions on routine home care and other service material will be displayed.

WESTWOOD PHARMACAL CORP.
Booth H-20

Lowila Liquid and Lowila Cake, soapless detergents, are exhibited here. If your Atlantic City hotel offers you ocean water in your room, you might want to try a surprisingly pleasurable bubble bath with LOWILA LIQUID. Both the cake and liquid lather profusely in salt water. While LOWILA preparations are suggested for the soap sensitive, we believe you will enjoy this unique application.

X-Ray & Radium

X-RAY & RADIUM
ANSCO
Booth L-8

The Ansco exhibit will feature color transparencies and prints of medical and general photographic subjects, also radiographs made with screen and non-screen types of X-ray film. The medical transparencies and prints will include gross specimens as well as photomicrographs. A precision-built semi-automatic 12—2¼x2¼ square format Reflex camera equipped with f3.5 coated lens will also be on display.

ORGANIZATION SECTION

Washington Letter

(From a Special Correspondent)

April 26, 1947.

President Lauds Pharmacists for Contribution to Public Health

In a letter to the American Pharmaceutical Association President Truman congratulated the pharmacists of the United States on their contribution to the health of the American people. His message was a prelude to the twenty-first National Pharmacy Week, April 20 to 26. He expressed confidence that the pharmacists would "continue to extend their efforts to improve public health" He pointed out that "many of our citizens go to the neighborhood pharmacy for help in time of sickness. The fact that pharmacists there employed are in a position to advise patrons where to go for diagnosis and treatment adds materially to the service available to the sick" This year National Pharmacy Week will be dedicated to public education on control of cancer in a cooperative program with the American Cancer Society.

Favorable Reports on Improved Artificial Hand

Favorable reports have been issued on a new artificial hand, with a mechanism perfected at the Naval Ordnance Laboratory at White Oak, Md, and a "cosmetic glove" almost indistinguishable from human flesh, developed at the Naval Dental School at Bethesda. The new hand was created after Lieut. Comdr. Russell G. DeLany, chief of plastics division, Naval Ordnance Laboratory, became a patient at Bethesda Naval Hospital. He asked to see the "glove" and found it "excellent," but when the old bulky artificial hand was shown to him he decided to send it to the laboratory for examination. Now there are ten of the experimental hands in use. The "glove" is attributed largely to work of Lieut. Comdr. Herbert J. Towle.

Army Nurse Chief to Retire

Col. Florence A. Blanchfield will retire May 21 as superintendent of the Army Nurse Corps after forty-one years of service in nursing. She was credited with helping to secure full military rank for nurses. Colonel Blanchfield had been with the Army Nurse Corps for twenty-nine years and in the Surgeon General's office since 1935. The American Red Cross has presented her with its national award for "exceptional service in behalf of humanity."

Public Health Service Training for Filipinos

Dr. Thomas Parran, Surgeon General of the U. S. Public Health Service, has awarded to 25 Philippine citizens public health fellowships which entitle them to a year's study of public health administration and methods in the United States. The fellowships are offered under the Philippine Rehabilitation Act of 1945.

Official Notes

TELEVISION BROADCASTS

The following programs have been arranged by the Bureau of Health Education for presentation over television station WBKB, Chicago, on the indicated dates:

May 22. Centennial of A. M. A. Endocrinology. Drs. Willard O Thompson and Austin Smith

June 5. Fitness in Girls and Women Drs Dean F. Smiley and Fred V. Hein.

June 19. Centennial of A. M. A.: Orthopedic Surgery. Dr Fremont A. Chandler.

Health education telecasts will be discontinued for the remainder of the summer season. Notice will be given in these columns on their resumption.

Medical Legislation

STATE LEGISLATION*

California

Bills Passed.—A. 796, which passed the senate April 18, to amend the **health and safety code**, proposes to authorize a person, by will, to direct that the whole or any part of his remains be given to a teaching institution, university, college or legally licensed hospital, or to the state director of public health. A. 797, which passed the senate April 18, proposes that every person of sound mind over the age of 18 years may by will **dispose of** the whole or any part **of his or her body** to a teaching institution, university, college or legally licensed hospital, either for use as such institution, university, college or hospital may see fit or for use as expressly designated in the will S. 808, which passed the senate April 10, to amend the health and safety code, proposes to require every licensed physician and surgeon or other person engaged in prenatal care of a pregnant woman, or attending such woman at the time of delivery, to obtain a **blood specimen** of such woman at the time of the first professional visit or within ten days thereafter and to submit such sample to an approved laboratory for a laboratory test for syphilis. S. 1070, which passed the senate April 16, to amend the business and professions code, proposes that conviction of a violation of the **narcotics or dangerous** drugs statutes of the state shall constitute unprofessional conduct. S 1071, which passed the senate April 16, to amend the business and professions code, proposes that the use or prescribing for or administering to himself of cocaine, opium, morphine, codeine, heroin, alpha eucaine, beta eucaine, chloral hydrate, paraldehyde or barbituric acid, **any of the narcotics, or alcoholic beverages** to an extent which is injurious to his practice by any person licensed under the provisions of the business and professions code shall constitute unprofessional conduct.

Delaware

Bill Enacted.—H 42, which was approved April 18, requires all persons desiring to obtain a **marriage license** to obtain a certificate from a duly licensed physician showing that the applicant has undergone a standard serologic test for syphilis and is not infected with such disease in a communicable stage According to the last report received by this Bureau, the law also contains a house amendment which defines the term "physician" as meaning any duly licensed medical, osteopathic or chiropractic practitioner.

Florida

Bills Introduced.—H 12 proposes the creation and establishment of a **college of medicine** and dentistry as a part of the University of Florida. S 151, to amend the law relating to the practice of massage, proposes to redefine the meaning of the practice so as to include the use of electrical apparatus

Illinois

Bill Introduced.—H. 373 proposes that no person who has been convicted of a **penitentiary offense** or who has been convicted in connection with the illegal sale of drugs or narcotics under the laws of any state or of the federal government shall be eligible for appointment or shall be employed as a physician in any state institution.

Iowa

Bills Enacted.—H. 314, which was approved April 17, is a hospital survey and construction act requiring a survey of existing hospital facilities throughout the state and the development of a program for the construction of additional facilities The law also requires the appointment of a **hospital advisory council** and designates the commissioner of public health as the agent to apply for and receive federal funds to be used for assistance in the state survey or construction program. H. 465, which was approved April 22, is a law for the licensing and regulating of hospitals. S. 381, which was approved April 17, provides for the licensing and inspecting of **nursing homes or boarding homes** for the aged

Kansas

Bills Enacted.—H 102, which was approved April 9, requires all persons applying for a **marriage license** to present a certificate signed by a physician legally qualified under the laws of the state of Kansas or of the state in which he is practicing that the applicant is not infected with syphilis in a stage making it communicable to a marital partner. H. 103, which was approved April 8, 1947, provides for the establishment of an **advisory laboratory commission** to formulate procedures and qualifications for the registering and approving of laboratories performing serologic examinations, to formulate procedures and methods of examination and approval of persons performing serologic tests in approved laboratories and to recommend to the state board of health the adoption of the procedures and qualifications so approved

Maryland

Bill Passed.—H. 69, which passed the senate March 28, proposes the creation of a state **board of physical therapy examiners** and defines physical therapy as "the treatment of human injuries, diseases or disabilities by means of the healing properties of massage, ultraviolet rays, mechanical devices, heat, cold, air, light, water and electricity, but not by means of roentgen rays radium surgery or drugs" Among other things the proposal also states that a physical therapist is one who treats only patients diagnosed and referred by licensed medical doctors

Bills Enacted—H J R 16, which has become chapter J R 11 of the Laws of 1947 provides for the appointment of a commission to study **medicolegal psychiatry** in the state S 358, which has become chapter 185 of the Laws of 1947 exempts from the medical practice act **Christian science practitioners** duly registered in the *Christian Science Journal* of the Christian Science Publishing Society, Boston, who treat human ills in accordance with the tenets of Christian science

Massachusetts

Bill Introduced—H 1921 proposes to require every school superintendent, principal, director, teacher, etc whose duties bring him into direct contact with school children to undergo an **x ray examination** of his chest to determine the presence of tuberculosis

Michigan

Bill Passed—S 201, which passed the senate April 18, proposes to authorize the state commissioner of health to regulate and promulgate rules and regulations controlling the **humane use of animals** for the diagnosis and treatment of human and animal diseases the advancement of veterinary, dental, medical and biologic sciences, and the testing and diagnosis improvement and standardization of laboratory specimens, biologic products pharmaceuticals and drugs The proposal would further require that no person, firm or corporation shall keep or use animals for experimental purposes unless registered to do so by the state commissioner of health

Rhode Island

Bill Introduced—H 830, to amend the administrative act of 1939, proposes, among other things, that the board of examiners in the **basic sciences** shall be selected as follows Two members shall be selected from the combined faculties of Brown University, Providence College and Rhode Island State College, who shall be full time professors or associate or assistant professors in the basic science subjects and the third member of the said board shall be a pathologist of training and experience sufficient to give him a broad knowledge of the subject

Texas

Bill Introduced—H. 786 proposes the creation of a **board of eugenics** and proposes further to authorize the superintendent of state institutions for the insane to perform sexual sterilization operations on inmates after having complied with the provisions of the proposal

Coming Medical Meetings

American Medical Association, Atlantic City, June 9 13. Dr. George F. Lull, 535 N Dearborn St., Chicago 10, Secretary

Aero Medical Association of the United States Atlantic City, Ritz Carlton Hotel, June 1 6 Dr. David S Brachman, 1016 Dime Bldg, Detroit 26, Secretary

American Association for Thoracic Surgery, St Louis, May 28 30 Dr. Richard H. Meade Jr, 55 E Washington St, Chicago 2, Secretary

American Association of Genito-Urinary Surgeons, Absecon, N J, June 4 6 Dr. Charles C Higgins, 2020 E 93d St, Cleveland 6, Secretary

American Association of Pathologists and Bacteriologists, Chicago, May 16 17 Dr Howard T Karsner, 2085 Adelbert Road, Cleveland 6, Secretary.

American Association of Plastic Surgeons, Nashville, Tenn May 5 6 and Memphis, Tenn, May 7 8 Dr Frederick A. Figi, 102 Second Ave S W, Rochester, Minn, Secretary

American Association of the History of Medicine, Cleveland, May 25 26 Dr. Howard Dittrick, 2020 E 93d St, Cleveland 6, Secretary

American Association on Mental Deficiency, St Paul, Minn, May 28 31. Dr. Neil A. Dayton, Box 51, Mansfield Depot, Conn, Secretary

American College of Allergists, Atlantic City, Hotel Senator, June 6 8. Dr Fred W. Wittich, 401 LaSalle Medical Bldg, Minneapolis 2, Secretary

American College of Chest Physicians Atlantic City, Ambassador Hotel, June 5 8 Mr Murray Kornfeld, 500 N Dearborn St, Chicago 10, Executive Secretary

American College of Radiology, Atlantic City, Haddon Hall, June 7 8 Mr Mac F. Cahal, 20 N Wacker Drive, Chicago 6, Executive Secretary

American Dermatological Association, Murray Bay, Quebec, Can, June 1 5 Dr Harry R Foerster, 208 E Wisconsin Ave, Milwaukee, Wis, Secretary

American Diabetes Association Atlantic City, Chalfonte Haddon Hall, June 7 8 Dr. Cecil Striker, 1019 Provident Bank Bldg, Cincinnati 2, Secretary

American Geriatrics Society, Atlantic City, *Hotel Brighton*, June 5 7. Dr Malford W. Thewlis, 25 Mechanic St, Wakefield, R I, Secretary

American Heart Association Atlantic City, Hotel President, June 6 7. Dr Howard B Sprague, 50 W 50th St, New York, Secretary

American Medical Women's Association, Atlantic City, June 7 8 Dr. Helen F Schrack, 216 N Fifth St, Camden, N. J, Secretary

American Neisserian Medical Society, Atlantic City, Marlborough Blenheim Hotel, June 8 Dr William L Fleming, 750 Harrison Ave, Boston, Secretary

American Neurological Association Atlantic City, Ambassador Hotel, June 16 18 Dr Walter O Klingman, *195 Ft* Washington Ave, New York 32, Secretary

American Ophthalmological Society, Hot Springs, Va, June 5 7 Dr. Walter S *Atkinson, 129 Clinton* St, Watertown, N Y, Secretary.

American Pediatric Society, Stockbridge, Mass, May 13 15 Dr Henry G Poncher, 1819 W. Polk St, Chicago 12, Secretary

American Physiological Society, Chicago May 18 22 *Dr* Maurice Visscher, University of Minnesota, Minneapolis, Secretary

American Proctologic Society, Atlantic City, June 7 8 Dr. Harry E Bacon, 2031 Locust St, Philadelphia 3, Secretary

American Psychiatric Association New York, Hotel Pennsylvania, May 19 23 Dr Leo H Bartemeier, General Motors Bldg, Detroit, Secretary.

American Radium Society, Atlantic City, June 8 Dr. Hugh F. Hare, 605 Commonwealth Ave, Boston 15, Secretary

American Rheumatism Association, Atlantic City, Ritz Carlton Hotel, June 7 Dr Richard H Freyberg, 321 E 42d St, New York 17, Secretary

American Society for Clinical Investigation, Atlantic City, Chalfonte Haddon Hall May 5 Dr Eugene A. Stead Jr, Grady Hospital, Atlanta 3, Georgia, Secretary

American Society for Experimental Pathology, Chicago, May 19 23 Dr Frieda S Robscheit Robbins, 260 Crittenden Blvd, Rochester, N Y, Secretary

American Society for Pharmacology and Experimental Therapeutics, Chicago, May 18 *22* Dr Harvey B Haag, Medical College of Virginia, Richmond 19, Va, Secretary.

American Society for the Study of Sterility Atlantic City, Hotel Strand, June 7 8 Dr John O Haman, 490 Post St, San Francisco 2, Secretary

American Society of Biological Chemists, Chicago, May 18 22 Dr Otto A Bessey, Public Health Research Institute, New York 9, Secretary.

American Society of Clinical Pathologists Atlantic City, June 4 8 Dr. Alfred S Giordano, 531 N Main St., South Bend, Ind, Secretary

American Society of Electroencephalography, Atlantic City, Marlborough *Blenheim Hotel, June 13 14 Dr Robert S Schwab, Massachusetts* General Hospital, Boston 14, Secretary

American Therapeutic Society, *Atlantic* City, Chalfonte Hotel, June 6 7. Dr Oscar B Hunter, 1835 I St, N W, Washington 6, D C, Secretary

Arizona State Medical Association, Tucson, May 7 10 Dr. Frank J. Milloy, 112 N Central Ave Phoenix, Secretary

Association for the Study of *Internal Secretions, Atlantic* City, June 6 7. Dr Henry H Turner, 1200 N Walker St, Oklahoma City 3, Secretary.

Association of American Physicians, Atlantic City, May 6 7 Dr Joseph T Wearn, Lakeside Hospital, Cleveland 6, Secretary

Federation of American Societies for Experimental Biology, Chicago May 18 22 Dr William H Chambers, 1300 York Ave, New York 21, Secretary.

Idaho State Medical Association, Sun Valley, June 16 19 Dr William B Handford, Caldwell, Secretary

Illinois State Medical Society, Chicago, Palmer House, May 12 14 Dr. Harold M Camp, 224 S Main St, Monmouth, Secretary.

Kansas Medical Society, *Topeka* May 12 15 *Dr John M* Porter, *512* New England Bldg, Topeka, Secretary.

Louisiana Mississippi Ophthalmological and Otolaryngological Society Biloxi, Miss, Buena Vista Hotel, May 5 Dr Edley H Jones, 1301 Washington St, Vicksburg, Miss, Secretary

Louisiana State Medical Society, *New Orleans* May 12 14 *Dr. P. T.* Talbot, 1430 Tulane Ave, New Orleans 13, Secretary

Maine Medical Association, York Harbor, Marshall House, June 22 24 Dr Frederick R Carter, 142 High St, Portland 3, Secretary

Massachusetts Medical Society, Boston, Hotel Statler, May 20 22 Mr Robert St B Boyd, 8 Fenway, Boston 15, Executive Secretary

Medical Library Association, Cleveland, Wade Park Manor, May 27 29 Miss Heath Babcock, New York State Medical Library, Albany 1, New York, Secretary

Mississippi State Medical Association, Biloxi, May 6 8 Dr T M Dye, Box 295, Clarksdale, Secretary.

Montana, Medical Association of, Missoula, *June 26 28* Dr H T Caraway, 115 N 28th St, Billings, Secretary

National Gastroenterological Association, Atlantic City, Hotel Chelsea June 4 6 Dr G. Randolph Manning, Room 319, 1819 Broadway, New York, Secretary

National Tuberculosis *Association*, San Francisco, June 16 19 Dr F D Hopkins, 1790 Broadway, New York 19, Executive Secretary

New Hampshire Medical Society, Portsmouth, Hotel Wentworth, June 19 20 Dr Carleton R Metcalf, 5 South State Street Concord, Secretary.

New York, Medical Society of the State of, *Buffalo*, May 5 9 Dr Walter P Anderton, 292 Madison Avenue, New York 19, Secretary

North Carolina Medical Society of the State of, Virginia Beach, Va, Cavalier Hotel May 12 14 Dr Roscoe D McMillan P O Box 232, Red Springs, Secretary

North Dakota State Medical Association, Fargo, May *25 27*. Dr. L. W. Larson, 221 Fifth St, Bismarck, Secretary

Ohio State Medical Association, Cleveland, May 6 8 Mr Charles S Nelson, 79 E State St, Columbus 15, Executive Secretary.

Oklahoma State Medical Association, Tulsa, Mayo Hotel May 14 16 Mr R H Graham 210 Plaza Court Bldg, Oklahoma City, Executive Secretary.

Rhode Island Medical Society, Providence May 14 15 Dr Morgan Cutts, 106 Francis St, *Providence* 3, Secretary

Society of American Bacteriologists, Philadelphia, May 13 16 Dr Leland W Parr, 1335 H St N W, Washington 5, D C, Secretary.

South Dakota State Medical Association, Rapid City, May 31 June 3 Dr Roland G Mayer, 22½ S Main St, Aberdeen, Secretary

Texas, State Medical Association of, Dallas Adolphus Hotel, May 5 8 Dr Holman Taylor, 1404 W El Paso St., Fort Worth 3, Secretary

United States Mexico Border Public Health Association, San Diego, California, and Tijuana, Mexico, May 6 8 Dr James A Grider Jr, 151 U S Court House, El Paso, Texas, Secretary.

West Virginia Medical Association, Charleston, May 12 14 Mr Charles Lively, 1031 Quarrier St., *Charleston* 24, Secretary

Wyoming State Medical Society, *Sheridan, June 23 25 Dr* George E Baker, 226 E 2d St, Casper, Secretary

GOVERNMENT SERVICES

ARMY

GENERAL KIRK'S PLAN FOR A MEDICAL SERVICE FOR THE ARMED FORCES

The following statement, in part, was presented before the Senate Armed Forces Committee, April 18, by Major Gen. Norman T. Kirk, the Surgeon General. It represents his personal plan and is not official:

Initially, the Armed Forces Medical Service would be formed from the medical services of the Army and Navy, including their personnel and the Medical Department facilities now operated by these services.

The Armed Forces Medical Service would be commanded by a Director General appointed from the senior medical officers of the Regular Medical Corps of the Army or Navy to serve on the staff of the Secretary of National Defense and to be responsible to him for advice on the health and medical care of all components of the armed forces.

The Director General would prepare policies, plans and directives governing the medical service and operate, command and administer all Medical Department troops and installations not attached to major forces.

Operations of the Medical Service in the Zone of the Interior and overseas theaters would be decentralized to Deputy Directors, who would supervise and command the medical services and installations in these regional areas except those attached to a major force. The regional areas or districts would correspond to those set up by the armed forces.

The Armed Forces Medical Service, under the Director General, would be charged with (*a*) operation of common hospitalization for the armed forces (all fixed hospitalization), including general, station and convalescent hospitals in the Zone of the Interior and overseas departments and in the Communication Zone in war; (*b*) the operation of a preventive medicine service, vital statistics, and common sick and wounded records; (*c*) the operation of a common research and development program, clinical and research laboratories, the Army Medical Library and the Army Institute of Pathology; (*d*) common procurement, storage and issue of medical supplies; (*e*) personnel procurement, officers and civilian employees; technical training and assignment of all commissioned, enlisted and civilian employees; (*f*) organization and technical training of all Reserve components and affiliated medical units; (*g*) preparation and defense of budgetary estimates for the requirements of its operations; the construction and repair of all required medical installations; (*h*) the coordination and direction of evacuation of sick and wounded by air and sea (medical regulator).

Each major force would have a Surgeon General, appointed from the Medical Corps of the Armed Forces Medical Service, and such additional attached medical troops and installations as the Secretary of National Defense determined necessary for the force commander to perform the medical mission assigned to him.

The Surgeon General of each of the three forces would have the staff required to carry out his mission, the attached medical personnel to each to consist of such specialized and nonspecialized personnel and such units as would be required by that force. He would be responsible for the specialized technical and tactical training of the attached medical personnel and for the research and development pertaining to his special needs; e. g.:

Surgeon General of the Army.—Tactical training of battalion and regimental detachments, medical battalions, medical groups, dispensaries, field and evacuation hospitals.

Surgeon General of the Navy.—Specialized and tactical training of attached medical personnel for duty aboard ships, including hospital ships, Naval Air Arm and research and development in connection therewith, dispensary service, evacuation of sick and wounded by ship.

Surgeon General of Air Force.—Specialized and tactical training of attached medical personnel such as flight surgeons and flight nurses, research and development as it applies to the health of flying personnel, air evacuation of the sick and wounded, and dispensary service.

The plan provides for complete unification of those phases of medical service which are common to all armed forces and at the same time provides for the Ground Forces, the Air Forces and the Navy types of organic medical service completely adequate for their special needs.

General Kirk stated that he agreed with the remarks of Senator Thomas of Utah (published in the *Congressional Record* March 14) in which the senator pointed out that the medical departments of the Army and Navy have identical primary missions, that there was in the past war an acute and serious scarcity of trained medical personnel, that parallel systems of hospitalization, evacuation, and the procurement, storage and issue of medical supplies were wasteful in terms of funds, personnel and efficiency, and that medical service during the war, no matter how good, could have been better had there been a single integrated medical service.

If integration of the two medical departments would have improved medical service in the war just past, it will be vital in any future war and likewise is vital during the peace.

There are not now nor will there ever be enough competent trained medical, dental and nursing personnel available to provide the sick, injured and wounded soldier, flier, sailor or marine with the type of medical care demanded by the people of this nation without the strictest economy in the use of that personnel. Even now the Medical Corps of both the Regular Army and the Regular Navy are far below their authorized strength, and efforts to recruit civilian doctors into these corps have not been successful. Legislation authorizing increased pay and better promotion may help solve this peacetime problem. In the event of a war of equal or greater magnitude than World War II there will not be sufficient skilled doctors in the United States to staff three separate medical services. This fact necessitates an organization capable of making the most effective and economical use of all the medical resources of the nation. Moreover, another war may involve the civilian population of the United States. Only a single unified medical service can plan for and successfully meet such an emergency.

General Kirk stated that unification of the medical services should begin now. If unification is vital to meet a national emergency, he said, it cannot be delayed until that emergency is at hand. Moreover, if no action is taken now to unify the army and navy medical services, the Air Forces will wish and may receive authorization for a complete medical service, thus spreading our weak medical resources still thinner, and this at a time when both the Army and the Navy are unable to recruit to their authorized strength.

If a plan for the unification of the medical services should be put into operation now, a certain period would be required before a complete integration could be effected smoothly. Many changes would be required in the present operating procedures of the two medical departments as well as enabling legislation. However, General Kirk believes that a completion date two to three years hence should be specified.

"I am sure," he said, "that American medicine including its leaders and the thousands of its members who served so well in the military forces during the past war, if asked, would demand a unified medical service for the armed forces."

Any plan for unification of the medical services, General Kirk said, will undoubtedly meet with opposition from some force commanders who will desire complete medical services under their command. Also there will be some opposition on the part of officers of the two medical services in which tradition and *esprit de corps* have naturally developed during many years. "However, after many years' association with medical officers of both the Army and the Navy I am convinced that in most instances their common training, their similar points of view and their singleness of purpose will eventually outweigh any prejudices they may have.

Medical News

(PHYSICIANS WILL CONFER A FAVOR BY SENDING FOR THIS DEPARTMENT ITEMS OF NEWS OF MORE OR LESS GENERAL INTEREST: SUCH AS RELATE TO SOCIETY ACTIVITIES, NEW HOSPITALS, EDUCATION AND PUBLIC HEALTH.)

ARIZONA

Annual State Medical Meeting.—The fifty-sixth annual meeting of the Arizona State Medical Association will be held at the Hotel Pioneer, Tucson, May 7-10 under the presidency of Dr. George O. Bassett, Prescott. The out of state speakers will be Dr. George T. Pack, New York, "Radical Surgical Treatment of Cancer of the Stomach," and Dr. Emil Novak, Baltimore, "Indications, Limitations and Hazards of Endocrine Therapy in Gynecology." Numerous members of the association will present papers, some of the subjects being recent advances in the treatment of heart disease, use of potassium chloride in treatment of dehydration and diarrhea in infants, management and mechanism of functional uterine bleeding and epidemic hepatitis. The president's dinner and dance will be May 8 at 7:30. The Woman's Auxiliary will meet during the sessions. The Arizona chapter of the American College of Chest Physicians will hold afternoon and evening sessions May 6.

CALIFORNIA

Society News.—The Los Angeles Society of Allergy, organized as a section of the Los Angeles County Medical Association, elected Dr. George Piness, Los Angeles, president; Dr. Willard S. Small, Pasadena, vice president, and Dr. Frank G. Crandall Jr., Los Angeles, secretary and treasurer.

Five Year Study of Poliomyelitis Virus.—A five year study, financed with $200,000 March of Dimes funds from the National Foundation for Infantile Paralysis, will be conducted at the California Institute of Technology, Pasadena, under the direction of Linus Pauling, Ph.D., and George W. Beadle, heads of the chemistry and biology divisions, respectively. The study will attempt to determine the complex structure and organization of the poliomyelitis virus by a study of the fundamental structure and organization of proteins and related compounds.

Course in Nuclear Physics.—The University of California Medical School, Berkeley-San Francisco, in association with University Extension, University of California, announces a course in the application of nuclear physics to the biologic and medical sciences, to be given at the medical center, San Francisco, from June 30 through July 18. It will consist of didactic lectures, laboratory demonstrations and seminars for round table discussions and will be open to workers in the fields of medical and biologic research. For information address Dr. Stacy R. Mettier, Head of Postgraduate Instruction, Medical Extension; University of California Medical Center, San Francisco 22.

CONNECTICUT

Graduate Course in Hospital Administration.—Yale University School of Medicine, New Haven, will establish next September a graduate course in hospital administration in its department of public health, made possible by a grant from the W. K. Kellogg Foundation. Dr. Clement C. Clay, New Haven, assistant professor of hospital administration, will act as director. Facilities of Grace-New Haven Community Hospital, university departments and schools, and hospitals and other agencies in the New England area will be utilized. Nine months of the total twenty-one month training period will be spent in residence at the university before the student becomes an administrative intern or resident in an approved hospital, after which he is a candidate for a master's degree. Three classes of students will be eligible for admission to the new course: doctors of medicine, graduate nurses who have a bachelor's degree and persons who have a bachelor's degree without special training in medicine or nursing. Some practical experience in hospitals or medical care agencies is a prerequisite. Dr. Clay received his degree of doctor of medicine and master of surgery at McGill University Faculty of Medicine, Montreal, Que., in 1932.

GEORGIA

Columbus Selected for Long Range BCG Study.—In cooperation with the state and local health authorities the U. S. Public Health Service has selected the city of Columbus, Ga., for a long range study of BCG vaccination for tuberculosis. It is planned to start this study, which will require several years, with school children, especially those highly subject to exposure to tuberculosis; only children, however, who show through tests that they have not previously been infected with tuberculosis will be vaccinated. The first vaccination program is expected to continue until about May 17; then the testing and vaccination teams will return to Columbus next fall to determine whether revaccination is necessary in some cases. The permission of parents will be obtained prior to vaccinations. According to the New York *Times* the vaccine for this experiment will come from the BCG laboratory at Cook County Hospital, Chicago, where it is produced jointly by the Public Health Service, the College of Medicine of the University of Illinois, Chicago, and the City of Chicago Municipal Tuberculosis Sanitarium.

ILLINOIS

The Tenth Cancer Diagnostic Clinic.—The tenth state aided cancer diagnostic clinic, opened April 10 at Herrin Hospital, Herrin, will hold clinic sessions every second and fourth Thursday of each month at 1 p. m., patients being admitted only through referral from their family physician.

Smallpox Vaccination Advisable.—Pointing to the current flare-up of virulent smallpox in New York City, Dr. Roland R. Cross, state director of public health, advised vaccination of every one who has not been vaccinated within three years. Although the disease is at low incidence in Illinois at this time, he said, it is quite prevalent in many other countries, and the present swiftness of travel means that persons can reach this country within a few hours after being exposed to the disease elsewhere.

Annual State Medical Meeting.—The Illinois State Medical Society will hold its annual meeting at the Palmer House, Chicago, May 12-14 under the presidency of Dr. Robert S. Berghoff, Chicago. The Oration in Surgery will be given Monday morning by Dr. Alfred Blalock, Johns Hopkins Hospital, Baltimore, on "Surgical Treatment of Congenital Cardiovascular Defects." On Wednesday afternoon the Oration in Medicine will be delivered by Dr. Herman Hilleboe, Assistant Surgeon General, Washington, D. C., on "The United States Public Health Service and the Private Practice of Medicine." Other speakers at the sessions will be:

Dr. Abe B. Baker, Minneapolis, Diagnosis and Treatment of Bulbar Poliomyelitis.
Dr. D. W. Gordon Murray, Toronto, Ont., Anticoagulants in the Treatment of Thrombophlebitis and Phlebothrombosis.
Dr. F. Bayard Carter, Durham, N. C., Mycotic Infections.
Dr. Roscoe L. Sensenich, South Bend, Ind., Are We Tending to Overemphasize Specialization?
Dr. Fred J. Hodges, Ann Arbor, Mich., X-Ray Demonstrable Lesions of the Colon.
Dr. Franklin H. Top, Detroit, subject to be announced.
Dr. Elexious T. Bell, Minneapolis, Pathologic Anatomy of Diabetes.
Dr. F. Bruce Fralick, Ann Arbor, Mich., subject to be announced.

For the first time each section of the society has the privilege of inviting an out of state physician in each specialty represented. At the annual dinner Tuesday evening the main address will be given by Father Alphonse M. Schwitalla, S. J., Ph.D., dean of the St. Louis University School of Medicine, St. Louis. A veterans' service dinner is planned for Monday evening. Numerous societies have planned meetings and luncheons, including the alumni associations of the University of Illinois College of Medicine and Loyola University School of Medicine, both of Chicago. The Woman's Auxiliary will meet May 12 and 13 at the Congress Hotel.

Chicago

Dinner to Honor Dr. Dogliotti.—The Chicago chapter of the International College of Surgeons will give a dinner and reception in honor of Professor A. Mario Dogliotti, head of the department of surgery of the University of Turin, Italy, May 5 at 6:30 in the Gold Coast Room of the Drake Hotel. Professor Dogliotti, who is president of the Italian chapter of the college, is visiting in the United States at the invitation of the Lahey Clinic and the Massachusetts General Hospital, Boston.

Jessie Horton Koessler Fellowship.—The Jessie Horton Koessler Fellowship of the Institute of Medicine of Chicago for the aid of research in biochemistry, physiology, bacteriology or pathology will be available September 1. The stipend is $500 a year, with the possibility of renewal for one or two years. Only such applications will be considered as are approved by the head of a department in the fields mentioned or by the director of a research institute or laboratory in Chicago and which stipulate that the recipient of the fellowship shall be given adequate facilities for carrying out the proposed research. Applications will be received up to July 1, and they should be sent in quadruplicate to Dr. Paul R. Cannon, Chairman of the Committee, 950 East 59th Street, Chicago 37. Since there are no formal blanks, applications should be made by letter.

LOUISIANA

Annual State Medical Meeting.—The annual meeting of the Louisiana State Medical Society will be held at the Roosevelt Hotel, New Orleans, May 12-14 under the presidency of Rhett G. McMahon, Baton Rouge. A clinicopathologic conference will be a part of the opening meeting. Two symposiums, one on antibiotics and one on hypertension, have been scheduled for Tuesday. Out of state speakers at the sessions will be:

Dr. Harry S. Gold, New York, Drugs Used in Treatment of Heart Diseases.
Dr. Maxwell Finland, Boston, Present Day Chemotherapy on Antibiotics.
Dr. George Salmon, Houston, Texas, Use of Antibiotics in Pediatrics.
Dr. Joseph G. Molner, Detroit, Epidemiology and Recent Developments in Poliomyelitis.
Dr. Robert D. Mussey, Rochester, Minn., Circumvallate Placenta: Symptoms and Management.

The president's reception and dinner dance will be given Tuesday evening at 8 o'clock. Dinners have been arranged for members of the Louisiana Pediatric Society and the American Board of Obstetrics and Gynecology.

MASSACHUSETTS

Annual State Medical Meeting. — The Massachusetts Medical Society will hold its one hundred and sixty-sixth annual meeting at the Hotel Statler, Boston, May 20-22 under the presidency of Dr. Dwight O'Hara, Boston. Three symposiums are scheduled for the general sessions, one on industrial medicine Tuesday morning, one on the distribution of medical care for the people of Massachusetts Tuesday afternoon and one on bronchiectasis Wednesday afternoon. Among general session speakers will be:

Dr. Frederick D. Weidman, Philadelphia, Ramifications of the Xanthomas.
Dr. Perrin H. Long, Baltimore, The Uses and Abuses of Chemotherapy.
Dr. Perry P. Volpitto, Augusta, Ga., Use of Anesthetic Drugs in Medical Practice.
Dr. Michael E. DeBakey, New Orleans, Thrombophlebitis and Phlebothrombosis.
Dr. Hans Selye, Montreal, Canada, Diseases of Adaptation in Their Application to Practical Psychosomatic Medicine.

Section meetings, to be addressed by some general session speakers, will be Wednesday and Thursday from noon to 2 p. m. Other subjects to be discussed at the meetings include "Diarrhea of the Newborn: Its Cause and Prevention," "Review of Some Recently Defined Virus Diseases," "Management of Diabetes and Its Complications" and "Thiouracil and Allied Drugs in Hyperthyroidism." The annual oration, will be delivered Tuesday morning by Dr. Leland S. McKittrick, Boston, on "Medical Care in Our Free Society." The Shattuck Lecture will be given Tuesday evening by Dr. William Dock, Brooklyn, on "Clinical Significance of Circulatory Peculiarities of Some of the Vital Organs." Dr. Harrison H. Shoulders, Nashville, Tenn., President of the American Medical Association, will give the dinner address Wednesday evening on "The Responsibilities of the Medical Profession."

NEW YORK

Annual State Medical Meeting.—The annual meeting of the Medical Society of the State of New York will be at the Memorial Auditorium, Buffalo, May 5-9 under the presidency of Dr. Louis H. Bauer, Hempstead. The first scientific program will be presented Wednesday at the general session. An extensive program of sectional meetings has been arranged at which the following out of state physicians will speak:

Heber H. Ryan Jr. and Curtiss B. Hickcox, Philadelphia, Complications with Pentothal Anesthesia.
Donald H. Stubbs, Alexandria, Va., Treatment of Intractable Pain.
Charles M. Barbour and Ralph M. Tovell, Hartford, Conn., Experiences with the Use of Intravenous Procaine.
Francis D. Moore, Boston, Treatment of Peptic Ulcer.
George Berkett, New Orleans, Effect of Drilling Through Neck of Femur in Perthes' Disease.
Bronson Crothers, Boston, Neurologic Procedures in Pediatric Practice.
Louis Schwartz, Bethesda, Md., Ringworm of the Scalp.
Samuel Brown, Cincinnati, Differential Diagnosis of Abdominal Tumors.
Andrew C. Ivy, Chicago, Peptic Ulcer.
Harry E. Bacon and Robert J. Rowe, Philadelphia, Primary Resection for Cancer of the Lower Bowel.
Sidney H. Licht, Cambridge, Mass., The Prescription of Occupational Therapy.

A Teaching Day has been arranged by the Council Committee on Public Health and Education for Tuesday. Obstetrics and gynecology, pediatrics, medicine and surgery will be the subjects discussed by members of the society. The annual banquet will be Wednesday at the Hotel Statler. The Woman's Auxiliary will meet May 4-7 at the Hotel Statler, and the Women's Medical Society of New York State will hold its annual meeting at the Hotel Statler May 4-5. Both technical and scientific exhibits will be on display.

New York City

License Revoked.—The Board of Regents voted Oct. 18, 1946 that the medical license issued to Dr. Frank Celano, Westbury, through indorsement of his Maryland medical license, be revoked, annulled and canceled and that his registration or registrations as a physician be ordered annulled and canceled of record.

Expand Industrial Hygiene Program. — To meet the growing demand for trained personnel the Columbia University School of Public Health is developing courses of study for physicians, nurses, engineers and chemists whose chief interest lies in the field of industrial hygiene or occupational medicine. For the academic year starting in September properly qualified students will be accepted as candidates for the degree of Master of Public Health or Master of Science in Industrial Hygiene. The curriculum will include lectures, seminars, demonstrations, laboratory exercises and field work appropriate to the interests of the students. Students working toward the Master of Public Health degree will be required to take, in addition to their industrial hygiene work, courses in other public health subjects such as biostatistics, epidemiology, administration, sanitary science and health education. Those enrolled for the Master of Science degree will be permitted to concentrate to a greater extent on industrial hygiene subjects. Information may be obtained from the Director, Columbia University School of Public Health, 600 West 168th Street, New York 32.

Institute for Cancer Research.—The cornerstone of the Sloan-Kettering Institute for Cancer Research, central unit of the $15,000,000 Memorial Cancer Center that will occupy the first block between New York and First avenues and 67th and 68th streets, was laid April 7. Alfred P. Sloan Jr., chairman of the board of directors; Charles F. Kettering, vice president and director of research of General Motors, and Dr. Lewis H. Weed, chairman, division of medical sciences, National Research Council, were among the speakers. Three hundred guests of honor attended exercises at the Memorial Hospital for the Treatment of Cancer and Allied Diseases. The institute, which will be ready for occupancy late this year, was provided for through the Alfred P. Sloan Foundation, which has given $2,000,000 for its construction and $2,000,000 to assist in operating it for ten years. The American Cancer Society, through the New York City Cancer Committee, has granted $250,000 for research and will expand its funds after the current drive. The fifteen story building will provide space to carry on a growing program of research which will include studies now in progress in Memorial Hospital laboratories as well as new ones. Units now in operation include laboratories for pathology, research and clinical investigation, pharmacology, biophysics, physics, antibiotics and hormone chemistry as well as departments of chemotherapy, protein chemistry and organic chemistry. The block where the center stands was given by John D. Rockefeller Jr. in 1936 together with $3,000,000 to erect the present hospital. The 68th Street façade of the institute will be marked by an unadorned panel extending to the top of the building and bearing the inscription "In This Institute a Few Labor Unceasingly That Many May Live."

OHIO

Ohio State Medical Alumni Dinner.—A dinner of graduates of the Ohio State College of Medicine, Columbus, attending the Centennial Celebration in Atlantic City will be held June 11 at the Claridge Hotel. They will be given a first hand description of Ohio's new nine million dollar medical center and will be shown a film, the "University in Transition." Those desiring reservations are asked to mail checks for $6 to Dr. Alfred H. Whittaker, 1427 East Jefferson Avenue, Detroit.

PENNSYLVANIA

Four Professors Appointed.—Four members of the faculty of the University of Pennsylvania School of Medicine, Philadelphia, have been appointed to fill professorships in the school. They are Drs. T. Grier Miller, Truman G. Schnabel, Charles C. Wolferth and Francis C. Wood, all of Philadelphia. The three first-named men now hold full professorships in clinical medicine, while Dr. Wood's appointment marks an advancement from an assistant professorship in medicine. When the new appointments become effective at the beginning of the university's fiscal year, July 1, Dr. Wood will also become chairman of the department of medicine, succeeding Dr. O. H. Perry Pepper. After forty years of service Dr. Pepper asked to be relieved of his administrative duties but will continue as professor of medicine and will teach and practice in the university hospital until he reaches the age of retirement.

TEXAS

Medical Aid in the Texas City Disaster.—The John Sealy and other affiliated hospitals of the University of Texas Medical Branch, Galveston, handled 408 casualties resulting from the Texas City disaster of April 16. Two emergency first aid and clearing station teams were at the scene of the explosion within forty minutes. These teams were formed of orthopedic surgeons, residents and senior medical students. They assisted in the efficient work of Texas City physicians and the industrial first aid groups in the prompt care and clearance of the injured to the various hospitals. Casualties began to arrive at the receiving station in the outpatient clinic within an hour. Three hundred and sixty-two casualties were classified, given preliminary treatment and hospitalized within the first five hours. Volunteer medical and nursing personnel and teams sent by the army and navy enabled ten operating groups to function during the following night and day. Some 40 additional casualties were admitted. By April 20 twelve deaths had occurred, two from gas gangrene, 120 patients had been discharged, 90 convalescents had been transferred to the army hospital at Fort Crockett, and the remainder were on routine hospital care. Few burns were encountered. Multiple puncture wounds, serious contusions and compound fractures, together with head, ear and eye injuries were frequent. Impressive were the results of close team work between skilled specialists. The large pool of medical and nursing students aided greatly in furnishing special technical help at all times. The anatomy staff and freshmen medical students assisted in the classification and identification of the dead. The blood bank and emergency supplies of whole blood furnished by Dr. Joel M. Hill of the Dallas Blood Bank of the Baylor University Hospital, Dallas, were major factors in the successful handling of the seriously injured. The American Red Cross responded promptly with large amounts of emergency supplies and with clerical personnel. A detailed report of the medical management of the casualties in the disaster will be prepared for publication in *Texas Reports on Biology and Medicine.*

WEST VIRGINIA

Diabetic Survey.—The Committee on Diabetes of the West Virginia State Medical Association at the initial meeting in Charleston April 3 decided to make an immediate study of the feasibility of establishing diabetic clinics in various sections of the state. A subcommittee was appointed to devise a method for a census of persons with diabetes on both a county and a state basis. It is proposed to obtain the bulk of the information from doctors, but information would also be obtained from diabetic patients by means of coupons printed in county and state papers. Another subcommittee was appointed to obtain from hospitals over the state information concerning the number of diabetic patients admitted for treatment during 1946. The committee is composed of Drs. William M. Sheppe, Wheeling, chairman; L. Rush Lambert, Fairmont; William A. Thornehill Jr., Charleston; Richard C. Neale, Bluefield, and Frederick Q. Whittlesey, Morgantown.

Health Conference.—The Annual Health Conference, which is a joint meeting of the West Virginia Public Health Association and the Health Officers Conference, will be held at the Stonewall Jackson Hotel, Clarksburg, May 16-17. The conference will open at 9 a. m. Friday, May 16. The first address will be by Ross Techemeyer, executive secretary, Public Employees' Retirement Fund, Indianapolis, on "Retirement Systems in the State of Indiana." He will be followed by Ralph Barnes, Atlanta, Ga., on "Rodent Control." The morning session will end with an address by Dr. Bruno Gebhard, director, Cleveland Health Museum, whose subject is "Seeing is Believing and Relieving." The remainder of the program follows:

Film "Clean Water."
Dr. Richard K. Anderson, New York, "Recent Studies in Nutrition as Applied to Public Health."
Dr. Oswald F. Hedley, Richmond, Va., "Newer Drugs in the Control of Tuberculosis."
Gertrude M. Church, Washington, D. C., "The Influence of the Public Health Nurse in the Community."
Dr. William F. McAnally, Pittsburgh, "Medicine and Hygiene in Industry."
Dr. Andrew P. Sackett, Charleston, "Method and Administration of Rapid Treatment."
Dr. Isabel Morgan, Charleston, "The Need for Prenatal and Well Baby Clinics in West Virginia."

Section group meetings will be held as follows: health officers, Dr. Leon A. Dickerson, Madison, W. Va., presiding; public health nurses, Miss Hattie Samples presiding; sanitary engineers and sanitarians, C. O. Snyder presiding and clerks, Paul Shanks presiding. The annual banquet will be held at the Stonewall Jackson Hotel Saturday evening.

GENERAL

Meeting of Bacteriologists.—The Society of American Bacteriologists will meet May 13-16 at the Bellevue-Stratford Hotel, Philadelphia. Six sessions will be devoted to medical bacteriology, pathogenesis on Tuesday afternoon, viruses on Wednesday morning, tuberculosis Wednesday afternoon, laboratory diagnosis and viruses Thursday afternoon, and immunology Friday afternoon.

International Congress of Nurses.—The 1947 congress of the International Council of Nurses will meet in Convention Hall, Atlantic City, N. J., May 11-16. Nurses from more than thirty countries are expected to attend to discuss such problems as the shortage of nurses and methods of meeting it, nurses' employment conditions and the place of the nurse in socialized medicine. Edith M. Beattie, executive secretary, Graduate Nurses' Association of the District of Columbia, Washington, D. C., is secretary of local arrangements.

New Society of Maxillofacial Surgeons.—At a meeting Feb. 13 in Chicago the newly organized American Society of Maxillo-Facial Surgeons elected Dr. Carl W. Waldron, Minneapolis, president, Dr. John W. Kemper, Ann Arbor, Mich., vice president, and Dr. Casper M. Epsteen, Chicago, secretary-treasurer. Membership in the society may be secured by invitation only for doctors of both medicine and dental surgery. The society will hold its first annual meeting in conjunction with the annual session of the American Medical Association in Atlantic City.

Study of Nursing Education.—The National Nursing Council, representing fourteen professional organizations, is undertaking an intensive study of the registered nurse's real job and the changes in education that she requires for it. The study is being financed by a grant from the Carnegie Corporation of New York under Esther Brown, director, department of studies in the professions, Russell Sage Foundation. The study will focus on how a basic professional nursing school should be organized, administered, controlled and financially supported to prepare its graduates adequately to meet community needs.

Aids in European Relief.—Dr. Abraham U. Neuwirth, Floral Park, N. Y., former medical adviser to the Iranian government, left April 17 for Europe, where he will assume the position of regional medical officer in the Joint Distribution Committee's public health program in behalf of the Jews of Europe. The committee has established a series of medical and health programs in Europe including the maintenance of more than 155 hospitals, clinics, dispensaries and maternity centers on the continent. Dr. Neuwirth, a graduate of Bellevue Medical College, New York, serving with the U. S. Army Medical Corps during the war, was attached to the Iranian government, where he supervised the vaccination of the army and civilians against typhus in 1942.

Annual Meeting of American Psychiatric Association.—This association will hold its annual meeting May 19-23 at the Pennsylvania Hotel, New York. Among the 120 papers to be presented are reports on advances in child psychiatry, brain surgery, convulsive disorders, shock therapy, alcoholism and forensic psychiatry. Among the speakers will be:

Dr. G. Brock Chisholm, Ottawa, Canada, The Future of Psychiatry.
Dr. Paul R. Hawley, Washington, Role of Motivation in Recovery from Medical, Surgical and Psychiatric Illnesses.
Pierre S. du Pont 3d, Wilmington, Del., The Psychiatric Foundation and Its Role in Public Education.
Dr. Robert H. Felix, Washington, D. C., The U. S. Public Health Service Program for the Development of Training, Research and Community Service in Mental Health.
Dr. William C. Menninger, Topeka, Kan., The Role of Psychiatry in the World Today.

Other speakers include Dr. Karl M. Bowman, head of the Langley Porter Clinic, San Francisco; Dr. Alan Gregg, director of the Division of Medical Science, Rockefeller Foundation, New York, and Major Gen. Howard McC. Snyder, Washington, D. C.

Marriages

Raymond Merchant, Crown Point, Ind., to Miss Shirley Irene Hambidge of Lafayette February 1.

William Vincent Rucker, Bedford, Va., to Mrs. Emilie McClain Warnock of Philadelphia in November 1946.

Marlin H. Poindexter Jr., Chillicothe, Ohio, to Miss Margaret Coughlin in Detroit Oct. 19, 1946.

Dale S. Raines to Miss Sarah Siebenmorgan, both of Terre Haute, Ind., January 11.

Deaths

Thomas Hall Shastid ⊕ Duluth, Minn., born in Pittsfield, Ill., July 19, 1866; University of Vermont College of Medicine, Burlington, 1888; specialist certified by the American Board of Ophthalmology; fellow of the American Academy of Ophthalmology and Otolaryngology, American Academy of Medicine, American Medico-Legal and Toxicologic Society, American College of Surgeons and the American College of Physicians; associate member of the American Museum of Natural History; member of the American Association for the Advancement of Science, World Calendar Association, National Society for Prevention of Blindness, History of Science Society and many others, including honorary memberships; in 1922 member of the International Congress of Ophthalmology in Washington; served as professor of history of medicine and later honorary professor at the American Medical College in St. Louis; visiting ophthalmologist at St. Luke's Hospital; consulting ophthalmologist, St. Mary's and Miller Memorial Hospital in Duluth and St. Mary's Hospital in Superior, Wis.; author of "Country Doctor," collaborator with Dr. Howard A. Kelly on Cyclopedia of American Medical Biography and American Medical Biographies, with Dr. James Moores Ball on Modern Ophthalmology, third, fourth, fifth and sixth editions, and with Dr. Conrad Berens, The Eye and Its Diseases; formerly editorial secretary of the *Ophthalmic Record;* at one time associate editor of the *Michigan Law Review;* collaborator, *American Journal of Ophthalmology;* member of the editorial staff of *Eugenics;* awarded honorary Doctor of Science degree by the University of Wisconsin; died February 15, aged 80, of uremia.

Bertram Harrington Buxton ⊕ Providence, R. I.; born in Worcester, Mass., in 1883; Harvard Medical School, Boston, 1908; professor of clinical obstetrics at the Tufts College Medical School; specialist certified by the American Board of Obstetrics and Gynecology, Inc.; member and past president of the New England Obstetrical and Gynecological Society; fellow of the American College of Surgeons; member of the American Association of Obstetricians, Gynecologists and Abdominal Surgeons; served as a first lieutenant in the Rhode Island National Guard, on the Mexican Border and with the American Expeditionary Forces overseas during World War I; received the Purple Heart and the Silver Star with Palm for gallantry in action; lieutenant colonel, medical reserve corps, not on active duty; for many years chief of staff, Providence Lying-In Hospital; at various times on the staffs of the Rhode Island, Charles V. Chapin and Butler hospitals; died February 9, aged 63, of coronary thrombosis.

Luis B. de la Vega, San Juan, Puerto Rico; College of Physicians and Surgeons, Baltimore, 1914; member of the American Medical Association; served as secretary of the Insular Board of Health and as president of the Puerto Rico Medical Association; formerly director of the Women's Hospital of Arecibo and the Maternity and Children's Hospital; a major in the medical corps of the Puerto Rico National Guard; on May 3, 1941 became lieutenant colonel in the Army of the United States, serving as assistant director of the U. S. Selective Service Board for Puerto Rico during World War II; died at Fort Brooke Hospital February 9, aged 58, of cerebral hemorrhage.

Harlan Page Abbott ⊕ Providence, R. I.; Harvard Medical School, Boston, 1889; an Affiliate Fellow of the American Medical Association; specialist certified by the American Board of Otolaryngology; fellow of the American College of Surgeons; past president of the Rhode Island Ophthalmological and Otological Society and vice president of the New England Otological and Laryngological Society; veteran of the Spanish-American War; for many years affiliated with the Memorial Hospital in Pawtucket and the Rhode Island Hospital, where he died February 2, aged 86, of carcinoma of the prostate.

Henry Victor Adix Sr., Gresham, Ore.; University of Oregon Medical School, Portland, 1907; member of the American Medical Association; died February 8, aged 73, of coronary thrombosis.

Otto Walter Aichele, Philadelphia; Jefferson Medical College of Philadelphia, 1911; died February 7, aged 59, of pulmonary carcinoma.

Howard Wilson Barker, New York; National University Medical Department, Washington, D. C., 1901; member of the American Medical Association and the Medical Society of the District of Columbia; served during World War I; formerly surgeon in the U. S. Public Health Service reserve; colonel, medical reserve corps, not on active duty; died in the Roosevelt Hospital February 19, aged 72, of acute appendicitis.

Chancey Lee Brittell ⊕ Chariton, Iowa; State University of Iowa College of Medicine, Iowa City, 1907; served as county physician and county coroner; on the staff of St. Joseph's Hospital, Ottumwa; died February 15, aged 64, of coronary sclerosis.

Elizabeth Viola B. Burns, Fort Wayne, Ind.; College of Physicians and Surgeons of Chicago, School of Medicine of the University of Illinois, 1902; member of the American Medical Association; died February 23, aged 78, of arteriosclerosis.

Joseph Calvary, Chicago; Ludwig-Maximilians-Universität Medizinische Fakultät, Munich, Bavaria, Germany, 1905; member of the American Medical Association; died in February, aged 66.

Charles Samuel Campbell ⊕ Coffeyville, Kan.; Rush Medical College, Chicago, 1902; fellow of the American College of Surgeons; surgeon, Southeast Kansas Hospital; died February 8, aged 68, of coronary occlusion.

Joseph Dessauer, Newark, N. J.; Julius-Maximilians-Universität Medizinische Fakultät, Würzburg, Bavaria, Germany, 1914; member of the American Medical Association; died recently, aged 59.

Charles Justice Ellis, Pittsburgh; Western Pennsylvania Medical College, Pittsburgh, 1901; member of the American Medical Association; for many years county jail physician; died February 16, aged 69, of coronary thrombosis.

William D. Freeman, Mount Ida, Ark.; University of Arkansas School of Medicine, Little Rock, 1899; served on the Selective Service Board during World War I; served as county health officer; member of the American Medical Association; died in the Methodist Hospital, Hot Springs, February 3, aged 83, of pneumonia.

Daniel S. Goble, Indianapolis; Kentucky School of Medicine, Louisville, 1892; died in the Methodist Hospital February 6, aged 77, of bronchogenic carcinoma.

Eugene Oscar Koeneman ⊕ Eldora, Iowa; College of Physicians and Surgeons of Chicago, School of Medicine of the University of Illinois, 1899; affiliated with the Eldora Memorial Hospital; died in Amboy, Calif., January 8, aged 77, when an automobile in which he was driving was struck by a train.

Henry Bennett Lavery ⊕ Lieutenant Colonel, U. S. Army, retired, Dubuque, Iowa; St. Louis University School of Medicine, 1926; U. S. Army Medical School and Medical Field Service School in 1928; School of Aviation Medicine in 1932; member of the Louisiana State Medical Society; entered the medical corps of the U. S. Army as a first lieutenant in August 1927; promoted through the various ranks to that of lieutenant colonel; retired Oct. 31, 1945 for disability in line of duty; died Dec. 3, 1946, aged 46.

Robert Lawrence Mason, Roanoke, Va.; Medical College of Virginia, Richmond, 1915; member of the American Medical Association; served on the staff of the Shenandoah Hospital; died January 15, aged 60, of chronic nephritis with arteriosclerosis.

James Thomas Nichols ⊕ Muskogee, Okla.; Denver and Gross College of Medicine, 1903; served during World War I; formerly city physician; on the staffs of the Oklahoma Baptist Hospital and the Muskogee General Hospital, where he died January 26, aged 68, of cerebral hemorrhage.

Ora Frank Parish ⊕ Grinnell, Iowa; Rush Medical College, Chicago, 1903; an Affiliate Fellow of the American Medical Association; fellow of the American College of Surgeons; served during World War I; on the staff of the Community Hospital, where he died February 16, aged 73, of carcinoma of the spleen.

William Henry Rogers ⊕ Brooklyn; Long Island College Hospital, Brooklyn, 1905; specialist certified by the American Board of Otolaryngology; fellow of the American College of Surgeons; on the staff of the Brooklyn Eye and Ear Hospital; died January 15, aged 72, of heart disease.

Arthur Marion Sparling, Sailor Springs, Ill.; Washington University School of Medicine, St. Louis, 1907; member of the American Medical Association; died in St. Anthony's Hospital, Effingham, February 7, aged 70, of cerebral hemorrhage.

Ray Henry Thomas ⊕ South Bend, Ind.; Indiana University School of Medicine, Indianapolis, 1914; at one time a past assistant surgeon in the U. S. Public Health Service reserve; died in Warsaw, Ind., recently, aged 58, of coronary thrombosis.

John Henry Thomsen ⊕ Omaha; John A. Creighton Medical College, Omaha, 1914; died in the Frederick Hospital January 21, aged 62, of cerebral hemorrhage due to hypertension.

Lucian N. Yost, Fairmont, W. Va.; Eclectic Medical Institute, Cincinnati, 1895; served as county health officer and county physician; died in the Fairmont Emergency Hospital February 4, aged 75, of cerebral hemorrhage.

Foreign Letters

BRAZIL

(From Our Regular Correspondent)

São Paulo, April 5, 1947.

The Effects of Curare

In 1944 Dr. Ettore Biocca was present when curare was being prepared by the Makú Indians (a primitive tribe of hunters); the ceremony took place in a *maloca* (Indian house) near a small affluent on the right margin of the Tiquié River adjacent to the Brazil-Colombia border. Samples of the various plants used by the Makú Indians were collected and brought by Biocca to São Paulo, where Hoehne of the Instituto de Botânica identified them. The Makú curare collected by Dr. Biocca in five different places (rivers Tiquié, Papori and Uaupés) had an average biologic activity per gram of about 7,000 minimum lethal doses for mice, inoculated intramuscularly. No curarizing effect could be demonstrated in the residue of the ethereal extract of the same curare (corresponding to 0.29 per cent of dry curare weight). The curarizing activity of chloroformic residue (0.45 per cent of dry curare weight) was about three times weaker than that of dry curare, while the curarizing activity of nonextractable bases, by ether or chloroform (11.41 per cent) was about four times stronger than that of dry curare.

Preliminary experiments were conducted with H. Stammreich of the Instituto de Fisica of St. Paul University subjecting curare solutions to radiation and controlling the curarizing activity of these solutions before and after irradiation. The curare solutions were practically inactivated only by the short ultraviolet region of the spectrum. For this reason a glass filter of Pyrex, which absorbs this region and transmits only waves above 3,200 angstroms, prevented the whole photochemical reaction. Waves between 2,500 and 3,000 angstroms roused a series of photochemical reactions which began apparently by small molecular alterations followed by a large decrease or total loss of curarizing power. Repeated intravenous injection of solution of Makú curare in rabbits did not cause either precipitins or specific antibodies to appear in the serum of these animals capable of complement fixation or of neutralizing the curarizing power of the solutions. In the same manner it was impossible to demonstrate in the rabbits subjected to these experiments any increase of resistance to curare poisoning. Makú curare seems therefore to lack any immunizing activity.

Blindness Caused by Intracranial Cysticercosis

Cysticercosis of the brain, like most intracranial lesions, may cause focal or general symptoms; nevertheless it often goes unrecognized. Only when focal symptoms are clearcut and the general ones point strongly to visual disturbance is its presence really suspected. In massive infection of a few weeks or months duration the complement fixation test for cysticercosis gives a strongly positive reaction. In a series of 312 necropsies done by Dr. João Montenegro in the Faculdade de Medicina de São Paulo between 1923 and 1927 cysticerci of the brain and meninges were found in 2.54 per cent of the cases. Dr. Montenegro also presented the clinical observations in 4 cases of endocranial cysticercosis with lesions of the optic chambers. The diagnosis was made by x-rays, by the complement fixation test for cysticercosis in the spinal fluid, by the cell count and by the albumin content. The Wassermann reaction for syphilis was negative in all. One patient was operated on and eight cysticerci were removed; one was examined post mortem. Two brothers of 1 of the patients probably had the same disease because the symptoms were the same. That would make a total of 6 clinical cases. The treatment consists in brain decompression, when there is intracranial hypertension, in order to save sight and sometimes life, according to Dr. Montenegro's account. Well localized cysticerci may be removed. Conservative treatment consists mainly in the administration of sedatives. Vermicides as well as radiotherapy have not proved to be of any value; improvement in a few patients thus treated might have been spontaneous.

TURKEY

(From Our Regular Correspondent)

Ankara, Feb. 15, 1947.

The Health of the Worker in Turkey

So far the Ministry of Health and Social Assistance has been responsible for maintaining the health of the worker. The public health law of 1929 called for the enactment of a worker's health and insurance law. The labor law was enacted in 1936. A labor office was then established at the Ministry of Economics, and all matters pertaining to industry and workers came under the administration of the government. With the establishment of the Ministry of Labor in 1945 the labor office at the ministry of economics became part of the Ministry of Labor, which like all other ministries has its own budget, a council, an under secretary of state, general directors and district inspectors. Under present conditions labor departments can be established in only fifteen localities. The responsibility for the health of the worker is now in the hands of the labor minister, Prof. Dr. Sadi Irmak. The new minister made an inspection tour to ascertain under what condition the workers work and live. Statistics show that from 70 to 75 per cent of Turkey's population is engaged in agriculture. Handicrafts and trades followed are those of goldsmith and silversmith, cloth and carpet weaving, cocoon and silk production, soapmaking, tanning and horseshoeing. The republic has added mineral mining, iron smelting, the making of railway rails, spinning, cloth mills and sugar refineries, thus making a beginning at industrialization. Most of these industries are in the hands of the government, employing about 100,000 workers, the majority unskilled. The old established military factories are still in operation.

The workers' health and compensation law contains 148 paragraphs, of which twelve relate to matters of health and safety precautions, eighteen to strikes and lockouts, which are unlawful, and to disagreements between employer and employed. There are regulations to safeguard the right of the workers in regard to industrial diseases, maternity and old age insurance, unemployment, illness and death compensation.

Establishments employing more than fifty workers must have a physician on the staff, those employing more than a hundred must have an infirmary and those employing more than five hundred must have their own hospital.

Handicrafts and trades are mostly found in small townships, heavy industry away from towns. There are not more than 100,000 skilled workers in Turkey. They are working in coal, chrome, copper, iron, mineral, lead and sulfur mines, in steel works, sugar refineries, tanneries, glass factories and spinning and cotton mills. Carpet and rug weaving is mostly done on handlooms in the homes of villagers. Munition production and military repair work are carried out in military factories, which are under the administration of the Ministry of National Defense. Workmen in railway repairshops and shipyards and dockworkers come under the same administration.

Correspondence

USE OF TESTOSTERONE IN ELDERLY MEN

To the Editor:—The following facts are well known and recognized: (1) Orchiectomy, by diminishing the amount of androgen, inhibits the growth of carcinoma of the prostate; (2) the administration of estrogen, by counteracting the action of androgen, inhibits the growth of carcinoma of the prostate; (3) the diagnosis of early carcinoma of the prostate is difficult and unreliable and cannot depend on rectal palpation alone, and (4) competent pathologists have found lesions which they believe to be carcinoma of the prostate in as high as 46 per cent of all autopsies performed on men of advanced years.

The following assumption is fully justified in the present state of our knowledge: The administration of androgen would probably stimulate and hasten the growth of carcinoma of the prostate.

The following hypothesis is an obvious one, and its implications are so serious that they cannot be disregarded: The administration of testosterone may bring about the onset of cancer in precancerous lesions of the prostate or even cause the development of carcinoma of the prostate de novo.

In view of these considerations, the most emphatic warning should be voiced concerning the current recommended and extensively used procedure of administering large doses of testosterone over long periods of time to elderly men, for a wide range of complaints, without any objective evidence of androgen deficiency or any real certainty that carcinoma of the prostate is not present.

I am informed that similar warnings are being put forward as to the use of estrogen in women. The principle is the same, and the dangers are similar in the two sexes.

David M. Davis, M.D., Philadelphia.

EUPHEMISMS IN MEDICAL PRACTICE

To the Editor:—The article on "Euphemisms and Equivalents in Teaching Practice," page 183, January 18, gently and thoughtfully points to certain weaknesses in clinical teaching. The author has presented helpful suggestions, but one wonders if he may not be too optimistic in his suggested treatment. He has advocated the use of euphemisms in discussing a patient's illness, although he apparently has in mind not so much euphemisms as synonyms, so chosen as to be unintelligible to the patient. Were such a treatment to succeed it would presuppose two capacities in the attending physician: (1) a remarkable acquaintance with the language in order to have a wide selection of synonyms at his disposal and (2) a rare intuitive insight into the patient's education and understanding, for without that he would not be able to select a synonym unintelligible to the patient.

From the author's article I am inclined to believe that he himself could make such an approach work, but I think he is sanguine in his assumption that students could be readily taught to make it work. Would not his laudable purposes be more surely realized by the following changes: 1. The patient's history and the discussion of his diagnosis and prognosis should be presented in the absence of the patient. Such a procedure would involve but little additional time on the part of the teaching physician, and the respect that it would show for the patient's personality would have significant pedagogic value. Under such a system the student would be less likely to refer to older and chronically ill charity patients as "old crocks," a term not infrequently heard in charity hospitals and one which best serves to indict the student for the inadequacy of his educational experience. This inadequacy can be corrected only by men with broader humanitarian interests. Such interests in the attending physicians would have greater effect if the teaching routine were arranged in a manner better calculated to reveal them. 2. All comments and observations at the bedside should be confined purely to a description of the sensible findings. Even in that description the use of synonyms, as the author of the article recommended, would be helpful. The average patient is probably less disturbed to hear he has a tachycardia than to be informed he has a fast heart. Such a teaching method would give the patient the impression that the student was primarily interested in how he felt and in what evidences of illness he had. The student would be rewarded by a better cooperation from the patient when he wished to carry out his examination. The system just outlined is rarely practiced, partly, no doubt, because the type of patient it would help does not publish his views in the scientific journals.

Were a well trained reporter to question some of these patients concerning their views on teaching methods, student treatment and the like he would not only be able to create a story of exceptional human interest but thereby would at once help these patients and contribute to the education of future physicians.

Bradford N. Craver, M.D., Summit, N. J.

TREATMENT OF POSTHERPETIC PAIN

To the Editor:—In Queries and Minor Notes in The Journal, March 8, page 733, there was an answer to an inquiry on the treatment of postherpetic pain. To the five measures of medical therapy recommended in the answer "before radical therapy is advised," the following are worthy of being added: (1) intravenous injections of Endoarsan of Endo Products Inc., Richmond Hill 18, New York, (2) Gynergen, (3) autoserum injections, (4) smallpox vaccine and (5) high voltage x-ray irradiation of the corresponding segments. Further information about treatment of postherpetic pain can be found in the following articles, which contain extensive bibliographies:

Baird, P. C., Jr.: Herpes Zoster, *New England J. Med.* **228:** 568 (May 6) 1943.
Edgerton, A. E.: Herpes Zoster Ophthalmicus, *Arch. Ophth.* **34:** 40 (July), 114 (Aug.) 1945.

The answer concludes "If these measures fail, the patient should be referred to a neurologic surgeon, who may do a root resection on the side of the involved area." Though many textbooks take the same attitude, it must be stressed that, when medical measures fail, the treatment of herpes zoster with paravertebral procaine injection should be tried before operations such as posterior root resection or chordotomy are considered. The following articles give information about the technic of these injections:

Freude, E.: Zur Behandlung des Herpes zoster, *München. med. Wchnschr.* **78:** 1617, 1931.
Rosenak, S.: Procaine Injection Treatment of Herpes Zoster, *Lancet* **2:** 1056 (Nov. 5) 1938.
Street, A.: Use of Sympathetic Nerve Block in Herpes Zoster, Bell's Palsy, *Mississippi Doctor* **20:** 480 (April) 1943.
Findlay, Thomas, and Patzer, Reynold: The Treatment of Herpes Zoster by Paravertebral Procaine Block, The Journal, Aug. 25, 1945, p. 1217.

In the latest publication on the subject of the treatment of herpes zoster (Reeves, R. J., and Waters, L. B.: Herpes Zoster, *Texas State J. Med.* **42:**490 [Dec.] 1946) the authors conclude that "roentgen therapy is an effective method of treatment in herpes zoster. . . . The combination of procaine injection and irradiation sounds feasible." Paravertebral injections with procaine give such good results that it is hardly necessary to resort to alcohol injections as recommended by F. Mandl (*Wien. klin. Wchnschr.* **48:**490, 1935) and others.

Robert Wartenberg, M.D., San Francisco.

Medical Examinations and Licensure

COMING EXAMINATIONS AND MEETINGS

NATIONAL BOARD OF MEDICAL EXAMINERS
EXAMINING BOARDS IN SPECIALTIES

Examinations of the National Board of Medical Examiners and the Examining Boards in Specialties were published in The Journal, April 26, page 1302.

BOARDS OF MEDICAL EXAMINERS

Alabama: Montgomery, June 24-26. Sec., Dr. D. G. Gill, 519 Dexter Ave., Montgomery 4.

Arkansas: * *Medical. Examination.* June 5-6. Sec., Medical Board of the Arkansas Medical Society, Dr. L. J. Kosminsky, Texarkana. *Eclectic.* Little Rock, June 5. Sec., Dr. C. H. Young, 1415 Main St., Little Rock.

California: *Written.* San Francisco, July 7-10. *Oral.* San Francisco, May 10-11. *Oral Clinical Examination for Foreign Medical Graduates.* San Francisco, June 21. Sec., Dr. Frederick N. Scatena, 1020 N. St., Sacramento 14.

Connecticut: *Examination.* Hartford, July 8-9. Sec., Dr. Creighton Barker, 258 Church St., New Haven. *Homeopathic.* Derby, July 8. Sec., Dr. Joseph H. Evans, 1488 Chapel St., New Haven.

Delaware: *Examination.* Dover, July 8-10. *Endorsement.* Dover, July 15. Sec., Medical Council of Delaware, Dr. J. S. McDaniel, 229 S. State St., Dover.

District of Columbia: * *Reciprocity.* Washington, June 9. Sec., Commission on Licensure, Dr. George C. Ruhland, 6012 E. Municipal Bldg., Washington 1.

Florida: * *Examination.* Jacksonville, June 24-25. Sec., Dr. Harold D. Van Schaick, 2736 S. W. Seventh Ave., Miami 36.

Georgia: Atlanta, Oct. 14-16. Sec., Mr. R. C. Coleman, 111 State Capitol, Atlanta 3.

Hawaii: *Examination.* Honolulu, July 8-11. Sec., Dr. S. E. Doolittle, 881 S. Hotel St., Honolulu 53.

Idaho: Boise, July 14-16. Sec., Bureau of Occupational Licenses, Dr. S. M. Poindexter, Eastman Bldg., Boise.

Indiana: *Examination.* Indianapolis, June. Exec. Sec., Board of Medical Registration and Examination, Miss Ruth V. Kirk, 627 K. of P. Bldg., Indianapolis.

Kansas: *Endorsement.* Kansas City, June 26. Sec., Board of Medical Registration and Examination, Dr. J. F. Hassig, 905 N. Seventh St., Kansas City 10.

Kentucky: *Examination.* Louisville, Sept. 22-24. Sec., State Board of Health, Dr. P. E. Blackerby, 620 S. Third St., Louisville 2.

Maine: Augusta, July 1-2. Sec., Board of Registration in Medicine, Dr. Adam P. Leighton, 192 State St., Portland.

Maryland: *Medical Examination.* Baltimore, June 17-20. Sec., Dr. E. H. Kloman, 1215 Cathedral St., Baltimore. *Homeopathic.* Baltimore, June 10-11. Sec., Dr. J. A. Evans, 612 W. 40th St., Baltimore.

Massachusetts: *Examination.* Boston, July 8-11. Sec., Board of Registration in Medicine, Dr. H. Q. Gallupe, 413 E State House, Boston.

Florida: May 31. Final date for filing application is May 16. Sec., Dr. M. W. Emmel, University of Florida, Gainesville.

Iowa: Des Moines, July 8. Sec., Dr. Ben H. Peterson, Coe College, Cedar Rapids.

Michigan: Ann Arbor and Detroit, May 9-10. Sec., Miss Eloise Lebeau, 101 N. Walnut St., Lansing.

Nebraska: Omaha, May 6-7. Dir., Bureau of Examining Boards, State Department of Health, Mr. O. F. Humble, 1009 State Capitol Bldg., Lincoln 9.

New Mexico: *Examination.* Santa Fe, May 4. Sec., Miss Marion M. Rhea, 114 E. Marcy St., Santa Fe.

Oregon: June 7. Final date for filing application is May 21. Sec., Mr. C. D. Byrne, University of Oregon, Eugene.

Rhode Island: *Examination.* Providence, May 14. Chief, Division of Professional Regulation, Mr. Thomas B. Casey, 366 State Office Bldg., Providence.

South Dakota: Vermillion, June 6-7. Sec., Dr. G. M. Evans, 310 E. 15th St., Yankton.

Tennessee: *Examination.* Nashville and Memphis, June 13-14. Sec., Dr. O. W. Hyman, 874 Union Ave., Memphis.

Council on Medical Education and Hospitals

HOSPITAL STAFF APPOINTMENTS

At the direction of the House of Delegates of the American Medical Association some years ago the Council on Medical Education and Hospitals formulated standards for the establishment of American boards for the certification of specialists and for the conduct of hospital residencies providing training in the various special fields of medicine. The aim was to improve the quality of training at this level of medical education. The physician responsible for directing such hospital training should himself have had training and experience approximately equivalent to that required of certification applicants, whether or not he is actually certified. But it was never intended that staff appointments in hospitals generally, or even in hospitals approved for residencies, should be limited to board certified physicians, as is now the policy in some hospitals. Such policies, if practiced extensively, are detrimental to the health of the people and therefore to American medicine. Hospital staff appointments should depend on the qualifications of physicians to render proper care to hospitalized patients, as judged by the professional staff of the hospital, and not on certification or special society memberships.

In this opinion the Council has the full concurrence of the Advisory Board for Medical Specialties, which represents all the American boards in the specialties. At the February 1947 meetings of the Advisory Board it was unanimously voted to adopt as the sentiment and policy of the Advisory Board the recent resolution passed by the American Board of Surgery, which reads:

> The American Board of Surgery is not concerned with measures that might gain special privileges or recognition for its certificants in the practice of surgery. It is neither the intent nor has it been the purpose of the Board to define requirements for membership on the staffs of hospitals. The prime object of the Board is to pass judgment on the education and training of broadly competent and responsible surgeons—not who shall or shall not perform surgical operations. The Board specifically disclaims interest in or recognition of differential emoluments that may be based on certification.

Since February, several separate American boards in the various specialties have taken similar action. The Council on Medical Education and Hospitals of the American Medical Association is completely in accord with this principle.

Bureau of Legal Medicine and Legislation

MEDICOLEGAL ABSTRACTS

Food, Drug and Cosmetic Act: Right of Government To Seize Misbranded Device.—The claimant purchased a Spectro-Chrome for the use of himself and his mother. In proceedings against the manufacturer, the government had obtained a judgment that the machine was fraudulent and, because this machine was shipped in interstate commerce, the government now claims the right to take it from the claimant even though he bought and paid for it and is using it in his home. The case was heard in the United States district court, D., Oregon.

It was stipulated that the device was shipped in interstate commerce, labeled with false and misleading statements as to its therapeutic capabilities. Regardless of this, however, the owner testified that he was satisfied with the machine and wanted to keep it, and that he and his mother had both obtained help by using it. He testified further that he did not intend to make commercial use of the machine, did not intend to permit it to be used outside his home or by others than his immediate family, which consisted of his parents and two brothers, both over 21 years of age and both having received a grammar and high school education similar to that of the defendant. The government relied on the words of the statute, that an article introduced into interstate commerce, with fraudulent representations as to its therapeutic value, may be seized and condemned "while in interstate commerce, or at any time thereafter. . . ." The government contended that the words "or at any time thereafter" permitted it to pursue and seize the article in a private home. The court quoted from the book of Constitutional Limitations, ed. 7, page 425, as follows:

> Near in importance to exemption from any arbitrary control of the person is that maxim of the common law which secures to the citizen immunity in his home against the prying eyes of the government, and protection in person, property, and papers against even the process of the law, except in a few specified cases. . . .

This case, said the court, is not one of such exceptions. It is nothing more than a well intentioned effort by high-minded and zealous officials to protect a man from what they deem to be folly, to the extent of following him into his home and family and there divesting him of property. This, insisted the court, cannot be done. The government admitted that the Spectro-Chrome is not inherently dangerous, but it said in its brief:

> It is claimed to be indirecly dangerous because the ailment of the user is aggravated by reason of the failure to consult competent medical authority.

This statement is not supported by any legal authority. The question, said the court, is not whether false and misleading statements were made to the claimant. The question is what does the claimant want to do about it? He says "Nothing. I am satisfied. I am being helped." But the government answers "We won't allow you to be satisfied. We won't allow you to help yourself. We know that you *may* be led into doing yourself harm, through relying too heavily on this machine, and thus not obtaining proper (by our standards) medical treatment." Without intending to give offense, the court concluded, I think no such proposition of paternal right in the field of public health has been advanced in modern times. At least I have been unable to find it in encyclopedias, treatises or law books. The judgment was therefore in favor of the claimant, and the government was denied the right to seize and condemn the machine.—*United States v. One Article of Device Labeled Spectro-Chrome, 66 F. Supp. 754 (Ore., 1946).*

Malpractice: Physician's Liability for Burns Received During Operation.—The plaintiff sued for damages caused by the alleged malpractice of the defendant physician. From a directed verdict in favor of the defendant, the plaintiff appealed to the Supreme Judicial Court of Massachusetts.

The plaintiff engaged the defendant, an obstetrician, to treat her before, during and after childbirth. About 11 p. m. on December 20 the plaintiff, who was in mild labor and three weeks overdue, entered a lying-in hospital in Boston, where the defendant had arranged for her room. The baby, her first and a large one, was born about 2: 10 a. m. on December 22. It was a difficult labor of thirty-five hours, and delivery was by the use of forceps after the defendant had performed an operation known as an episiotomy. About twelve minutes after anesthesia had started, in order to sterilize the field of operation, the defendant applied Scott's solution (mercurochrome, distilled water, 95 per cent alcohol and a chemical known as acetone [a solvent which has a tendency to dry up]) to the legs, to the perineum and to an area extending half way from the pubic bone to the umbilicus. During the delivery and operation the plaintiff "was lying on a rubber sheet at the time of delivery; the rubber sheet was put just under her buttocks." The following afternoon the plaintiff told the defendant that her back was sore and burned but the defendant said that was natural and would leave in a few days. There was a similar conversation the following day. On December 24 she told the defendant her back was worse and burning. The defendant then made an examination, which disclosed on each buttock a second degree burn covering in each case an area of approximately 2 by 3 inches. He said "My God, what a mess; my God, what happened here. . . . It is a darn shame to have this happen." He also said that "she had a very hard delivery, and it was a burning shame to get that on top of it, and it was because of negligence when they were upstairs." He thought that apparently it was from the solution being allowed to stay in the part of the "mat" which was recessed from the pressure; and that "the closest he could figure was that the solution was on the rubber mat and exposed her skin for too long a period." At the trial the defendant testified: "She got these burns while in the delivery room. . . . He thought she got the burns at the time of the delivery." In answer to interrogatories the defendant stated that "the plaintiff did receive burns on both her buttocks while she was under his care and treatment" and that there were "no negligent acts or omissions on the part of the plaintiff or by others than the defendant which caused the injuries suffered by the plaintiff."

The plaintiff was not required, said the court, to show the exact cause of her injuries or to exclude all possibility that they resulted without fault on the part of the defendant. It was enough that she showed that the harm which befell her was more likely due to negligence of the defendant than to some other cause for which he was not liable. The jury could have found, continued the court, in accordance with the defendant's admissions, that the plaintiff's injuries were due to negligence; that there was no negligence on the part of the plaintiff or of any one other than the defendant; that, by the process of elimination, this negligence was that of the defendant; and that, in particular, this negligence of the defendant related to the exposure of the plaintiff in the delivery room, while under his direction and care, to a solution on the delivery table which he himself had administered. It is no answer, said the court, to say that the admissions were merely statements of regret, sympathy and benevolence evoked by human suffering. This is, of course, true of the statements that it was a "shame" and "unfortunate." But it is in no way true of the references to "negligence" and to the definite declaration that the burns were attributable to the solution being on the "mat" and to the plaintiff's skin being exposed to the solution "for too long a period."

On the basis of all the evidence the court was of the opinion that the trial court erred in directing a verdict for the defendant. Accordingly the plaintiff's exceptions were sustained.—*Woronka v. Sewall, 69 N. E. (2d) 581 (Mass., 1946).*

Current Medical Literature

AMERICAN

The Association library lends periodicals to members of the Association and to individual subscribers in continental United States and Canada for a period of three days. Three journals may be borrowed at a time. Periodicals are available from 1937 to date. Requests for issues of earlier date cannot be filled. Requests should be accompanied with stamps to cover postage (6 cents if one and 18 cents if three periodicals are requested). Periodicals published by the American Medical Association are not available for lending but can be supplied on purchase order. Reprints as a rule are the property of authors and can be obtained for permanent possession only from them.

Titles marked with an asterisk (*) are abstracted below.

*Attempt to Prevent Histamine Induced Ulcers in Guinea Pigs with Benadryl (Beta Dimethylaminoethylbenzhydryl Ether Hydrochloride). J. T. Crane, S. Lindsay and M. E. Dailey.—p. 56.
Some Effects of High Lipid Diets on Intestinal Elimination: IV. Saturated Fatty Acids. Helen L. Wikoff, B. H. Marks, Jean F. Caul and W. F. Hoffman.—p. 58.
*Formation of Concretions of Aluminum Salts of Fatty Acids After Use of Aluminum Hydroxide. G. P. Child, W. K. Hall and S. H. Auerbach.—p. 63.
Management of Constipation with Refined Psyllium Combined with Dextrose. L. H. Block.—p. 64.
Cause and Pathogenetic Mechanism of Hypertrophic Cirrhosis of Liver of Hanot Type. A. O. Wilensky.—p. 74.

Benadryl and Histamine Induced Ulcers.—Crane and his associates describe experiments on 16 guinea pigs, which had the aim to determine whether benadryl would prevent the formation of gastric and duodenal ulceration induced by prolonged administration of histamine. Treatment with benadryl did not prevent histamine induced ulcers in guinea pigs.

Concretions of Aluminum Salts of Fatty Acids.—Child and his associates report the history of a man aged 36 who had had chronic duodenal ulcer for fifteen years. Following a severe hemorrhage in March 1945 the patient made an uneventful recovery on a bland diet with atropine and aluminum hydroxide medication. Three months after this hemorrhage and while still taking the antacid and maximum doses of tincture of belladonna he suffered another acute episode of severe pain culminating in hemorrhage. His stools were found to contain small formed white masses. Their passage was accompanied with intermittent periods of constipation and diarrhea, cramps and pain suggesting intestinal irritation. Chemical analysis of these concretions showed them to be composed of fatty acid salts of aluminum, with a small amount of neutral fat and traces of cholesterol and protein. The patient recalled a similar sequence of events with about the same interval between hemorrhages in 1941. At that time the white concretions were not analyzed.

American Journal of Medicine, New York

2:131-228 (Feb.) 1947

Potassium Deficiency in Case of Lymphosarcoma with Sprue Syndrome. H. E. Harrison, Helen C. Harrison, R. R. Tompsett and D. P. Barr. —p. 131.
*Clinical Comparison of Effectiveness of 6-n-Propylthiouracil and 2-Thiouracil as Antithyrotoxic Agents. T. H. McGavack, A. J. Gerl, Mildred Vogel and S. Schutzer.—p. 144.

Relationship of Streptococcal Infections to Rheumatic Fever. H. F. Swift.—p. 168.
Heredity and Rheumatic Disease. May G. Wilson.—p. 190.

Propylthiouracil and Thiouracil as Antithyrotoxic Agents.—McGavack and his associates, in reporting the results of administering propylthiouracil to 100 patients, observe that too little of the drug was given to some of these patients, so that they were subjected to operation or returned to the use of thiouracil. In the 75 patients whose symptoms of toxic goiter were brought fully under control by the drug the symptoms and qualitative therapeutic responses were similar in eve[illegible] thiouracil. The initial doses of [illegible] varied between 75 and 250 mg. and maintenance doses from 25 to 75 mg. One severe febrile reaction was encountered in a patient who had previously developed a similar response to thiouracil. Ten of the 75 patients have had no recurrence of thyrotoxic symptoms four months after discontinuing 6-n-propylthiouracil. The drug is safe and effective for the management of all forms of hyperthyroidism.

Hyperthyroidism After Discontinuing Use of Thiouracil.—The basis of this report by Bartels is experience with 21 patients having primary hyperthyroidism, observed for as long as two and a half years from the standpoint of remission or relapse after withdrawal of thiouracil. Eight patients remained in remission and 13 had a relapse. The duration of thiouracil administration after restoration of the basal metabolic rate to normal was not a factor in the duration of remission, since prolonged remissions occurred after short therapy and prompt relapse was observed after long treatment. Clinical experience indicates that patients with mild primary hyperthyroidism may occasionally have a prolonged remission either spontaneously or following brief iodine therapy. Therefore thiouracil might be classified with iodine in its power to cause a remission in mild hyperthyroidism. If the 8 patients now in remission are observed long enough, all can be expected to have a relapse. Patients having large thyroid glands or large recurrent remnants, in whom the basal metabolic rate is in the higher range, can be expected to have a relapse not later than six months after withdrawal of the thiouracil.

Endocrine Influences on Blood Pressure of Normal and Hypertensive Rats. E. W. Page and E. Ogden.—p. 150.

Surgical Treatment of Phlebothrombosis.—Bancroft is impressed with the fact that many of the thrombotic processes originate in the veins of the broad ligament and that to treat a gynecologic or obstetric case successfully a bilateral approach is the best procedure. When the complication occurs as the result of some general surgical process, the treatment of the involved side is probably sufficient. There is a certain risk in the bilateral approach because in sucking out the thrombus from a vein one is likely to suck out more blood than one realizes, and a bilateral approach might tend toward exsanguinating the patient. Where phlebothrombosis is present and there is danger of pulmonary emboli, the operative approach and ligation of the vein is safer than relying on the use of anticoagulants or lumbar sympathetic block. While excellent results have been reported from the use of anticoagulants without operative intervention, convalescence is safer and is shortened by either proximal ligation or thrombectomy. Emboli have occurred shortly after the cessation of heparin therapy.

Diagnosis of Hydatidiform Mole.—The method of diagnosing hydatidiform mole presented by Acosta-Sison is based on the fulness of part or the whole of the lower uterine segment in conjunction with undue uterine enlargement as related to the number of months of amenorrhea, uterine bleeding, absence of a fetus as revealed by palpation auscultation and of fetal movements, and absence of amniotic fluid.

Carcinoma of Cervix During First Two Decades of Life.—In a chronologic table beginning with 1880, Pollack and Taylor list 30 true carcinomas of the cervix in females less than 20 years of age. They themselves observed one in a woman aged 18. The histologic type in 22 patients was adenocarcinoma. In the majority the clinical course was progressively downward. Four patients survived five years. The apparent tendency of cancer to manifest itself to an increasing degree during the earlier decades is a fact calling for more emphasis.

Nonportal Distribution of Trabeculae in Dietary Cirrhosis of Rats and Carbon Tetrachloride Cirrhosis of Rats and Guinea Pigs. L. L. Ashburn, K. M. Endicott, F. S. Daft and R. D. Lillie.—p. 159.

Histopathology of Monocytic Leukemia.—By a detailed study of the histopathologic changes in 8 cases of monocytic leukemia, Herbut and Miller have shown that reticuloendothelial cells are unquestionably the precursors of monocytes. Proliferation and transitions to the freely circulating cell appear to depend on the age of the patient and the degree of stimulation. A fulminating course in a young person will produce extensive reticulum hyperplasia because the maturation of the cells cannot keep pace with proliferation. In an older person a similarly acute course will produce less hyperplasia because the tissues are less adaptable to proliferation. In the latter, as well as in protracted cases, there is a more subtle and complete transformation of the reticuloendothelial cells into monocytes, and the transitions are more difficult to demonstrate. Like all reticuloendothelial cells, the Kupffer cells of the liver were seen to participate in the formation of monocytes in some cases. All transitions from initial swelling to complete extrusion into the sinusoidal lumens were encountered. A heterogeneous accumulation of leukocytic elements, producing a picture resembling Hodgkin's disease, was found in acute cases. The brain was examined in 3 cases. In each of these there were leukemic infiltrates and hemorrhages. The latter were of sufficient degree to be a contributory or immediate cause of death in 2 cases.

*Clinical Observations on Diagnosis and Treatment of Headache with Histamine. O. J. Dixon.—p. 891.

Penicillin Lozenge Therapy.—Observations reported by Taylor and his associates indicate that patients given penicillin lozenges after tonsillectomy appeared to have less membrane formation in the tonsillar fossae. They also complained less of pain than patients not so treated. Similar findings were made in patients following dental extractions. *Penicillin lozenge* therapy seemed to be of little value in deep-seated tonsillitis or pharyngitis but appeared to have definite value in early cases of pharyngitis. Bacteriologic findings support the clinical observations. The total, and more particularly the Streptococcus viridans, counts of mouth and throat flora were lowered by penicillin lozenge therapy. The persistence of penicillin in mouth washings was of short duration after the disappearance of the lozenges.

Histamine Headache.—Dixon reports observations on a series of patients with various types of headache who were given histamine as a diagnostic or a therapeutic measure. The routine course of treatment usually began with 0.35 cc. of histamine diphosphate, given subcutaneously, with the daily dosage increased by 0.05 cc. until a maximum of 1 cc. was reached. The patient was sometimes aware of a slight headache, temporal throbbing and flushing, which lasted for a few minutes. When relief from the complaint was obtained, it was no effort to have the patient continue on a routine schedule. The injections should continue for about twenty-one days. Complete relief was obtained in 55 per cent of the cases, intermittent relief in 35 per cent, slight relief in 5 per cent and no relief in 5 per cent. Patients with typical histamine headache will continue to be rare, and borderline cases will respond in a highly satisfactory manner. Any diagnosis which can be made and proved only by some form of therapy always involves many errors.

Tests of Liver Function in Schistosomiasis Japonica, with Particular Reference to Antimony Treatment and with Report of 2 Autopsies. S. W. Lippincott, F. K. Paddock, M. C. Rhees, W. B. Hesselbrock and L. D. Ellerbrook.—p. 62.
*Immersion Hypothermia. E. Wayburn.—p. 77.
Syphilis: Review of Recent Literature (concluded). F. W. Reynolds and J. E. Moore.—p. 92.
Review of Neuropsychiatry for 1946. S. Cobb.—p. 113.

Cerebral Manifestations in Schistosomiasis Japonica.—Tillman says that among 181 patients admitted to his hospital during the peak of the Philippine campaign 6 were observed with cerebral manifestations. An additional patient observed at another hospital is included in this report. The first patient was a soldier who was admitted with a diagnosis of encephalitis from two to three months after exposure. There were quadriplegia, confusion, disorientation, pupillary changes, paresis of the abducens nerve and incontinence. Recovery was slow and incomplete one and a half months later. Leukocytosis and eosinophilia were evident. Ova of hookworm and Schistosoma japonicum were demonstrated. The effects of fuadin and antimony and potassium tartrate were beneficial. Residua involving the pyramidal and extrapyramidal tract and the cortex were present three months after the onset of disturbances of the central nervous system. Cases identical with those reported may arise in the United States either if a person comes from endemic areas by rapid air transportation or if the disease has been asymptomatic, undiagnosed or not entirely cured by treatment.

Immersion Hypothermia.—Wayburn describes observations on 6 patients who had been immersed in the North Sea on their return from long combat flying missions. Immersion hypothermia is a progressive clinical syndrome. The clinical picture is the resultant of the coldness of the water, the length of the exposure, the emotional factors affecting the patient before and during exposure and the specific response of the person to cold. The chief effects are those on the cardiovascular system. Among the transient conditions observed were auricular fibrillation and flutter, ventricular extrasystoles, slight prolongation of the PR interval and falling arterial blood pressure, with narrowing of the pulse pressure. Involvement of the nervous system was indicated by partial to complete loss of consciousness and irrational behavior. Hemoconcentration and notable hyperglycemia were found in 1 case. Treatment consists in rapid restoration of normal body temperature by external heat, minimal activity, administration of warm fluids by mouth and, in severe conditions, use of blood plasma. No drugs were used in this series. Use of epinephrine is contraindicated.

Effects of Radioactive Phosphorus (P^{32}) on Normal Tissues.—Platt reports 43 cases in which tissue changes produced by radiophosphorus were studied microscopically including cases of various forms of leukemia, Hodgkin's disease, multiple myeloma, lymphosarcoma and melanoma. In almost every therapeutic application of radiation, normal tissues are affected as well as the intentionally irradiated focus of disease. The beta emanations of radioactive phosphorus produce characteristic changes in many body tissues, which vary in intensity but are similar to those produced by other types of radiation. Prominent specific features are varying degrees of cellular death, abnormal mitoses producing giant irregular nuclei, fibrosis, hyalinization of collagen and a vascular alteration characterized by thickening and hyalinization of small blood vessels. There is selective localization of larger quantities of radioactive phosphorus and greater injury in the tissues most often involved by the neoplastic cells of malignant lymphomatoses and myelomatoses, i. e. marrow, liver, spleen and lymph nodes. Changes were also demonstrated in the lungs, kidneys, gastrointestinal tract, ovaries and testes. The author thinks that serious consideration must be given to the changes in the testes and the ovaries of patients who are in the reproductive period of life because observation of these organs confirms the possibility that spermatogenesis and oogenesis may decrease or disappear, with development of sterility, in young persons given radiophosphorus.

Estrogenic Substance in Advanced Mammary Carcinoma.—The favorable results obtained by some English investigators with estrogenic substance in women with advanced carcinoma induced Herrmann and his associates to try this procedure in 17 selected patients, who were treated exclusively with a synthetic estrogen (ethinyl estradiol) administered orally. The dose of ethinyl estradiol varied from 0.15 to 0.7 mg. daily. There was a favorable response in 7 of the patients, 5 with superficial lesions of the soft parts and 2 with pulmonary metastases. The authors stress that their experiences with the estrogenic treatment does not differ greatly from that reported by British authors in about 100 cases. An important point of agreement is that the favorable results are obtained predominantly in women above the age of 60. Estrogens seem to have a decidedly deleterious effect on women in the younger age group. This appeared to be most striking in a 40 year old patient who was menstruating regularly. When first seen her general condition was good despite the mass in the right breast and right axilla. Soon after the institution of the estrogenic therapy her condition deteriorated. Within threee months she was bedridden, and she died one month later.

Granulomas Caused by Surgical Sutures.—Orr reports 5 instances of granulomatous lesions which developed after the use of surgical silk and cotton in clean wounds. He stresses that late infection caused by nonabsorbable sutures usually develops slowly. Pain is not severe, and the patient may complain only of discomfort. A firm indurated mass forms beneath the scar of operation, which is usually slightly tender. There may be a slight rise in temperature and leukocyte count. Incision reveals a relatively small abscess surrounded by a firm wall of fibrous tissue 1 cm. or more in thickness. Granulomas caused by surgical silk and cotton must be uncommon, since they occurred but four times in several hundred clean operations in the University of Kansas Hospitals.

Acute Attacks of Malaria.—Bang and his associates present a comparison between atabrine and quinine in the treatment of acute attacks of malaria in white soldiers infected during the campaigns in Australian New Guinea. Atabrine was superior to quinine in the treatment of acute vivax malaria. No significant differences in response to therapy were noted in 104 cases of falciparum malaria treated with quinine as compared with 99 cases treated with atabrine. Both fever and parasites disappeared rapidly under treatment. Heavy infections responded as rapidly as light infections.

Infectious Hepatitis and Blood Transfusion.—A hepatitis survey was carried out on the first day of June 1945 in all army general hospitals in the United States. Of 1,762 patients with hepatitis under treatment 500 gave a history of receiving transfusions of blood or blood products prior to the onset of hepatitis. There had been 15 deaths from hepatitis in the thirty days immediately preceding the date of survey, including 9 among the transfused patients. In the group who had received transfusions prior to the onset of hepatitis the intervals between wounding (or onset of initial illness) and the development of hepatitis formed a striking pattern. This interval was between eight and sixteen weeks in 63 per cent. The peak interval was from ten to twelve weeks. The pattern in the transfused group did show a close resemblance to the incubation periods of jaundice resulting from vaccination with icterogenic lots of yellow fever vaccine in 1942. Sartwell concludes that a large proportion of the cases of hepatitis in transfused individuals probably resulted from transmission of an icterogenic agent in the transfused blood or plasma.

Effect of Quinine and Atabrine on Gastric Secretion.—Babkin and Karp studied the effect of quinine and atabrine (quinacrine) on gastric secretion in dogs evoked by faradization of the vagus nerves or by subcutaneous administration of histamine dihydrochloride. Intravenous administration or moderate doses of quinine bisulfate or atabrine diminished the gastric secretion produced by rhythmic vagal stimulation. Small or moderate doses of quinine or atabrine did not affect gastric secretion evoked by the subcutaneous administration of histamine. The amount of pepsin discharged from the peptic cells (pepsin output) under the influence of vagal stimulation was diminished after intravenous administration of quinine or atabrine. The effect of quinine on gastric secretion during oral therapy in a normal dog with an esophagotomy and a gastric fistula was rather weak. Atabrine will act on gastric secretion mildly and will diminish to a certain extent the nervous or cephalic phase of secretion, which is so much exaggerated in ulcer patients. The doses of atabrine which can be used in ulcer patients will have to be determined. Special cases of peptic ulcer will have to be selected in which a moderate inhibition of vagal gastric secretion would be beneficial. Harm may be done by employing atabrine in cases with a tendency to hemorrhage, owing to the vasodilatory action of this drug.

Diasone Therapy in Pulmonary Tuberculosis.—Kettelkamp and Friedman point out that the sulfonamides have been disappointing in the chemotherapy of tuberculosis but that related compounds, called sulfones, have been found more effective. One of these is diasone. Seventeen patients were selected for diasone therapy. They were mainly those in which ordinary therapy had failed. Five of the 17 cases showed some improvement. None of these changes were remarkable or spectacular. In 3 of the cases other procedures may have played a part. In 1 case, although improvement has occurred in one area, in another area a cavity has increased in size. In the last case, after initial improvement the clinical course has remained stationary.

Urethane of B-Methyl Choline and Gastric Motility.—According to Machella and his associates great changes occur in the secretory and motor functions of the stomach following section of the vagus nerve. The retention may lead to gastric distress, anorexia, nausea, vomiting and malnutrition.

Acc·Mo· 59

The authors show that motility may be restored by the administration of a parasympathicomimetic drug. The subcutaneous administration of urethane or B-methyl choline to a postvagotomy patient who had gastric retention led to restoration of gastric peristalsis and motility and relieved him of his epigastric distress, anorexia and nausea. Subsequently its oral and sublingual administration had a similar effect. A placebo was not equally effective. In another vagotomized patient the parenteral administration of the drug induced sufficient tonus and peristalsis, as well as pyloric relaxation, to permit duodenal intubation, a procedure which was accomplished prior to vagotomy but had been impossible during the postvagotomy period.

Gastroileostomy, a Rare Surgical Error.—Brown and his co-workers point out that a rather typical syndrome develops following supposed gastrojejunostomy in patients in whom a gastroileostomy has been done by mistake. The authors review the previous literature of 22 cases and present 3 new cases. The predominant symptoms are loss of weight, pain, vomiting, which may be fecal in type, and diarrhea. The stools may contain undigested food material. There may be great loss of weight due to poor assimilation. Pain may shift to the periumbilical and even to the lower abdominal area and may be quite severe. Hemorrhage occurred in 3 and ileac ulcer was present in 6 of the 22 cases previously reported. Serial barium meal films are most helpful in the diagnosis. In 2 of the cases reported a patent pylorus responded promptly and extremely well to simple disconnecting of the "gastroenterostomy."

Vitamin D in Scleroderma.—Norman believes that vitamin D therapy, rather than parathyroidectomy, is the treatment of preference in scleroderma and the related disorders that are accompanied by hyperfunction of the parathyroid glands. He suggests that chronic overfunction of the parathyroids constitutes a common denominator in scleroderma, dermatomyositis, chronic arthritis, Raynaud's disease and arteriosclerosis. Such hyperfunction is presumably induced to maintain physiologic plasma, calcium and phosphorus levels, which in these conditions are defective owing to inadequate intake of vitamin D and calcium or to the chronic lack of irradiation of the skin, the organ for the elaboration of the vitamin. He reports 3 cases of sclerosis all with skin manifestations and apparently some muscle and tendon involvement. There was sclerosis of the arterioles and edema of the collagen fibers in the first 2 cases. In the third case there was atrophic arthritis in addition to cutaneous and subcutaneous manifestations. In all 3 the condition of the hands and feet resembled that in Raynaud's disease. In all 3 improvement to the point of complete rehabilitation occurred, with restoration of normal skin and presumably normal condition of the arterioles. Where complete ankylosis had not ensued, joint involvement was reduced; active and passive movements increased and pain subsided.

Aerosol of Aminophylline in Asthma.—Prigal and his associates treated 40 adults who had bronchial asthma with an aerosol of aminophylline produced by a combined steam generator and aerosolizer. Thirty-two of the patients experienced various degrees of relief, ranging from slight temporary to great and prolonged. Five patients with severe asthma responded to aminophylline by inhalation after failing to respond to aminophylline intravenously. Some cases unresponsive to the aerosol did respond to the intravenous injection. Some cases responded to neither method. Vital capacity studies of 9 asthmatic patients, before and after the administration of aminophylline aerosol, showed an average increase of 20.6 per cent. The steam generated by the aerosolizer may in some instances afford some relief (5 of 9 patients responded favorably), but this is slight when compared with the relief obtained with aminophylline.

Allergic Parotitis.—Waldbott and Shea point out that cases of recurrent swelling of the parotid gland have been reported which indicate that it may occur on an allergic basis. In 3 patients with asthma parotid swellings occurred shortly before the onset of asthmatic seizures. In 1 of these patients the swellings had been present for many years before the development of asthma. Foods were identified with the production of these attacks, and their elimination produced relief. Allergy should be considered as a factor in the production of certain cases of recurrent parotitis.

Changes in Brain of Monkeys Following Electric Shock.—Ferraro and his co-workers demonstrate that electric currents similar in type, intensity, duration of current flow and frequency with that used in human electric shock therapy may cause morphologic changes in the central nervous system of monkeys. The nerve cell alterations are mostly related to circulatory disturbances and increased permeability of the blood vessel walls. When a current of greater intensity and of longer duration is applied, occasional minute petechial hemorrhages result. This seems to support the contention that the severity of the lesions is proportional to the intensity of the electric current, the duration of the current flow and, to a lesser extent, to the number of electric shocks. The histopathologic changes are more pronounced in the areas of tissue traversed by the main

Library

path of the current. Reversible chemical or structural changes and possibly some permanent slight structural damage may be at the base of the temporary alterations in the mental processes occurring in patients in the course of electric shock therapy.

Spina Bifida and Cerebrospinal Fluid.—According to Hassin and Harris the cystic tumor-like protrusion in spina bifida is a distended subarachnoid space caused by excessive accumulation of spinal fluid. The excess is due to defective absorption, the avenues of its escape along the perineurial spaces of the roots, spinal ganglions and the postganglionic peripheral nerves being destroyed. Deprived at the affected levels of the cord of the skeletal and dural support, the constantly accumulating fluid leads to the expansion and consequent protrusion of the subarachnoid membrane and the formation of a sac. Excessive accumulation of spinal fluid in the subarachnoid space may ultimately reflect on the spinal cord where its tissue fluids become stagnant, forming cavities, cysts or so-called meningomyelocystocele. This condition is not a specific type of spina bifida but a complicated meningomyelocele. Hydrocephalus is not an integral part of spina bifida but a distant complication, mostly by so-called Arnold-Chiara malformation, itself probably secondary to traction on the medulla oblongata or cerebellum or both.

Teratoid Tumors of Nervous System in Childhood.—The 15 teratomas and teratoid tumors reviewed by Ingraham and Bailey were found among 231 neoplasms of the central nervous system operated on at the Children's Hospital in Boston. Eight of the tumors were intracranial and 7 were intraspinal. All contained one or more cysts. The tumors contained tissue elements in their solid portions varying from only keratinizing epithelium to mixtures derived from all germ layers. One tumor, made up of undifferentiated nerve and striated muscle cells, was highly malignant, freely invading the cerebellum and seeding the meninges. There was nothing to suggest the diagnosis preoperatively, but it could be established at operation by demonstration of hair, by finding keratinized or ciliated cells in the cyst fluids or by frozen section. The use of adrenal cortex extract proved to be a valuable adjunct in an operation at which a teratoma of the third ventricle was removed. Two of the patients are living five years or more after operation without evidence of recurrence, 5 for less than five years without evidence of recurrence, 2 have evidence of recurrence and 6 are dead. In 2 patients partial removal of intraspinal teratomas was followed by excellent return of function without recurrence of symptoms over a long period of years.

Pica: Its Relationship to Lead Poisoning.—Stetson points out that pediatricians encounter children who eat a variety of bizarre substances, such as hair, dirt, plaster, ashes and animal excrement. The term "pica" has been used to denote this phenomenon. Evidence has been presented that a dietary deficiency of iron, resulting in a microcytic hypochromic anemia, may cause gastric anacidity in children, and that an appreciable number of these children will develop pica. Stetson reports 2 cases. Serious and even fatal lead poisoning may occur in these children following the ingestion of lead-containing paint from furniture and woodwork. He suggests that early and adequate treatment of such anemia may, by eliminating pica, result in the prevention of similar cases.

Compensation in One Trauma Cancer.—In reported opinions of appellate courts it has been ruled that medical opinion favoring the relationship between trauma and cancer may be supported by one or more facts which, taken together with the expert's testimony that a causal relationship is possible, constitute substantial evidence of that relationship. Such facts are that: 1. The external tissues were apparently "normal" and "healthy" before the trauma. 2. The trauma occurred at the site of the subsequently discovered cancer and was immediately attended with evidence of injury. 3. Such symptoms continued until a cancer was discovered. 4. The cancer appeared within a time after the injury consistent with the known life history of such a cancer. 5. The cancer was of a type that might result from such an injury. 6. There was no other cause for the development of the cancer at that particular place. The courts have not held that it is necessary to prove all these facts. Seelig rests his conviction on personal clinical experiences, of which he cites several. The literature contains a sufficient number of contradictory statements to prompt one to doubt the dictum that no relationship exists between the infliction of a single trauma and the subsequent development of cancer at the site of injury.

Penicillin Inhalation Therapy.—Segal and Ryder report results obtained with penicillin aerosol in the treatment of 95 patients with bacterial pneumonia, suppurative bronchitis, bronchiectasis, lung abscess, infective bronchial asthma, infective laryngotracheobronchial edema, chronic pulmonary emphysema and emphysematous blebs. Generally 25,000 units of penicillin was dissolved in isotonic solution of sodium chloride and given at three hour intervals for six to eight doses daily. A nebulizer was used which produced a fine mist. Many of the patients were helped considerably and some dramatically. Determinations of the penicillin content of the blood revealed peak levels at the end of thirty minutes which in some cases persisted for as long as two hours. Streptomycin aerosol was also employed in 2 cases of bronchiectasis due to Friedlander organisms, but streptomycin resistive strains appeared rapidly and could not be eradicated despite tremendous doses. This phenomenon was not observed in the penicillin aerosol treated cases. Penicillin may be safely combined with streptomycin aerosol. It is possible that streptomycin aerosol, perhaps combined with intramuscular therapy, may prove of value in selected cases.

Role of Lancefield Groups of Streptococci in Respiratory Infections.—Dingle and his co-workers of the Commission on Acute Respiratory Diseases undertook to determine the role of various groups of streptococci in ordinary respiratory infections A total of 3,026 patients with respiratory infections were studied In a large army camp only 6 per cent of patients admitted to the hospital from an organization of new recruits had respiratory infections due to streptococci. Bacteriologic and immunologic studies demonstrated that 90 per cent of the infections were due to group A, 4 per cent to group C and 3 per cent to group G. Clinical and epidemiologic evidence suggested that a few patients had infections due to groups B and F. The illnesses produced by the various groups of beta hemolytic streptococci were similar. Streptolysin O antibodies were demonstrated in serum specimens obtained from patients harboring organisms of groups A, C and G. Antifibrinolysin developed in patients with infections due to group A and group C streptococci The titer of antifibrinolysin in the serum specimens taken during the acute and convalescent phases from patients with infections due to groups C and G was identical when measured with fibrinolysin prepared from organisms of groups A, C and G.

Intraductal Injections of Ether in Choledocholithiasis.—Michel reports the histories of 2 women with multiple calculi in the common duct. In each case it was believed that adequate choledochotomy had been performed, but subsequent cholangiography revealed a stone lodged at the ampulla which had been missed at operation. In both instances the stones were causing only incomplete obstruction of the duct and might have been overlooked if cholangiography had not been performed Ether irrigations were successful in dislodging the calculi. Calculi causing incomplete obstruction may be entirely asymptomatic and the stools may be normal in color. However, recurrent complete obstruction of the choledochus is inevitable in such cases. Therefore cholangiography should always be performed after choledochotomy, regardless of the normal appearance of the stool, the absence of symptoms and the diminution of the degree of jaundice.

Food Utensil Bacteriology.—The survey presented by Hutchinson shows that in communal feeding centers the cleaning of eating utensils is unsatisfactory. The finding of dysentery bacilli on the cutlery in one out of only twenty-five kitchens is rather disquieting and may suggest the origin of sporadic cases of "diarrhea." The finding of pathogenic streptococci fourteen times and of pathogenic staphylococci thirty-six times may help to explain the high incidence of septic mouth lesions so common in the last few years. The prevalent method of washing and drying infected crockery and cutlery appears to do little in the way of destroying their pathogens. Great interest was shown by the proprietors of the premises visited, and they were eager to know what measures could be adopted to remedy defects.

Supraspinatus Syndrome.—Armstrong says that lesions of the supraspinatus tendon and subacromial bursa are the commonest cause of pain in the shoulder. This paper is based on 89 cases collected in three years. The mechanism by which the syndrome is produced is simple. In the middle range of abduction of the humerus the supraspinatus tendon, with its covering bursa, impinges against the overlying acromion. When a lesion of tendon or bursa exists, this pressure causes pain, and reflex muscle spasm accompanies any movement that tends to bring the lesion into contact with the acromion.

The cardinal signs of supraspinatus syndrome are (1) a painful arc (between 60 and 120 degrees) on abduction of the humerus, (2) reversal of the normal scapulohumeral rhythm and (3) tenderness on deep pressure over the supraspinatus tendon. Pain may lead to disuse, adhesions and limitation of movement. Two thirds of the patients recovered spontaneously. The remaining third were cured by acromionectomy.

Myanesin, a New Synthetic Curarizing Agent.—Myanesin is a synthetic substance having the formula alpha: beta-dihydroxy-gamma (2-methylphenoxy) propane. On the basis of the use of this new curarizing agent in 112 cases Mallinson stresses that it has a wider margin of safety than curare. Doses of 5 to 20 cc. (about 7 to 28 mg. per kilogram) do not produce undesirable effects. Abdominal relaxation is obtainable even in the conscious patient, and without any distress. The drug does not cause intercostal paralysis in doses producing full relaxation of the abdominal muscles. In most cases it is much more effective with barbiturate anesthesia than is curare and apparently enhances the action of the barbiturates. So easily is abdominal relaxation obtained under pentothal-nitrous oxide-oxygen when myanesin is used that the use of the more toxic agent cyclopropane is not necessary. It is effective under the lightest possible anesthesia. A true assessment of this or any other curarizing agent must await the results of tens of thousands of cases. Myanesin must still be considered an experimental drug.

Spinal Anesthesia for Renal Failure in Weil's Disease.—Williams reports the history of a man aged 61 who had had Weil's disease for eight days. He was drowsy, deeply jaundiced and dehydrated, with blood pressure 100/70 and blood urea 321 mg. per hundred cubic centimeters. Since recovery from such a state is rare, particularly at the age of 61, it was decided to adopt active measures to increase his urinary output and remedy his hypotension before irreparable renal damage had taken place. When his blood pressure had been raised to 130/90, high spinal anesthesia was induced up to the level of the seventh dorsal vertebra. The results were dramatic, and diuresis began, with a good urea content of the urine. After a day's lag the blood urea level fell at a remarkable speed. Recovery was complete.

Calciferol in Tuberculous Conditions.—Macrae says that the 20 cases of lupus vulgaris in which calciferol was given a trial were some of the worst in the country. The patients were divided into three groups, 7 patients being given intramuscular injections of an oily solution and receiving 600,000 units twice weekly, 7 an oily solution in capsules and 6 an emulsion, both latter groups having 150,000 units a day by mouth. During the first two or three weeks practically every one looked decidedly worse. Improvement began after three weeks in most cases, but in some of the worst not until after five or six weeks. Lupus vulgaris is best treated institutionally. The sedimentation rate should be measured at least once a month and treatment stopped if an unusual rise is found. Calciferol is of greatest value in the treatment of lupus vulgaris, but local treatment still has a place. Calciferol has given promising results in some forms of surgical tuberculosis. Toxicity is present in 50 per cent of the cases. Other disadvantages include the occasional dissemination of tuberculosis and flaring up of a quiescent site elsewhere. Constant supervision is necessary.

Responsibilities of Practitioner in Civil Aviation in South Africa. R. W. S. Cheetham.—p. 49.
*Central Nervous System Manifestations of Glandular Fever. T. Schneider and D. A. Michelson.—p. 57.

Manifestations of Central Nervous System in Glandular Fever.—Schneider and Michelson report the case of a youth aged 18 who, when admitted to the hospital, presented symptoms of severe meningitis and encephalitis. It was only as a result of the blood count that the possibility of glandular fever was thought of. The titer of the Paul-Bunnell test varied from day to day, dropping from the enormously high ratio of 1:28,000 to negative and then again becoming positive. The patient made a rapid recovery. Diagnosis of glandular fever should be kept in mind in all cases presenting symptoms of encephalitis or acute benign lymphocytic choriomeningitis. Cases presenting these symptoms should be kept under observation for a prolonged period after discharge for the detection of possible late sequels.

Blood Circulation in Bone. A. Lamas, D. Amado and J. C. da Costa.—p. 362.

Angioneurotic Edema of Stomach.—Chevallier and Moutier assert that there is no other organ which becomes edematous as often and as easily as does the stomach. They present the histories of 11 patients. The first 5 patients had pure angioneurotic edema (Quincke's disease). The edematous masses were voluminous and the visceral edema may or may not coincide with tegumentary edema. One of the patients of this group developed angioneurotic edema of the face after the ingestion of strawberries and gastroscopy revealed diffuse edema. Another patient of this group developed urticaria in response to fish, chocolate and strawberries, and gastroscopy disclosed edema. The second group, comprising 2 patients, had toxic edema; 1 of them had chronic benzene intoxication and in the other the intoxication was the result of working with glue used in the making of shoes. In these toxic cases the edema was somewhat less voluminous. In the third group of 4 patients the edema was associated with various forms of anemia or with cachectic gastritis. In all except the patients with anemia the allergic character of the edemas was indicated by various cutaneous manifestations.

*Pneumonectomies and Lobectomies in Treatment of Pulmonary Tuberculosis. R. M. Garraud.—p. 18.

Pneumonectomy and Lobectomy in Pulmonary Tuberculosis.—Garraud considers pulmonary resection as having a definite place in the treatment of pulmonary tuberculosis. Pneumonectomy and lobectomy should be applied only to a limited number of patients in whom considerable destruction of the pulmonary parenchyma may be localized in one lobe or in one lung, when other methods of treatment have proved ineffective or may be contraindicated (cavity associated with bronchial stenosis, tight adhesions, tuberculoma). The remaining healthy pulmonary tissue must be sufficient to insure respiratory function after the surgical intervention. The mortality rate is still high, with an average of 15 to 20 per cent, but a better selection of cases and improvement in anesthesia and in technic may reduce it to 5.5 per cent. Only late results will tell whether pulmonary resection is preferable to thoracoplasty.

Hemorrhagic State in Patients with Pulmonary Tuberculosis. L. Swalue and C. Renard.—p. 442.

Nonhypoglycemic Comas Produced by Insulin.—Hoet and Vuylsteke report the histories of 4 patients in whom coma was produced by insulin, but the pathogenesis of this type of coma differs from that of true hypoglycemic coma. It may continue for hours and days and does not respond to dextrose injection. This nonhypoglycemic coma is similar to that which develops after a series of comas produced by insulin shock therapy. That type of coma likewise cannot be counteracted by the administration of dextrose. A poor nutritional state and particularly B_2 hypovitaminosis seem to be prominent among the factors causing this hypersensitivity of the nervous system.

Pathogenesis, Etiology and Clinical Aspects of Disturbances in Orthostatic Regulation of Circulation. A. F. Essellier.—p. 70.

Fatalities Caused by Electrocardiographic Exertion Test.—Rossier and Spühler report the histories and the necropsies of 3 patients in whom exertion tests resulted in death. The electrocardiograms taken during rest had failed to reveal changes indicative of organic cardiac lesions, but all 3 patients had coronary disease. The authors warn against the routine indiscriminate use of the exercise tolerance test. The severity of exercise has to be individually adjusted, and caution is required in patients with coronary lesions.

Observations on Lumbar Disk Hernia. K. Lenggenhager.—p. 1314.

Desoxycorticosterone Acetate in Adrenal Insufficiency.—Kappert discusses the different forms in which desoxycorticosterone acetate can be administered, with particular attention to the implantation therapy. Signs of excessive sodium chloride and fluid retention are the most important secondary effects of treatment with desoxycorticosterone acetate. Slight edema of the face and the extremities, together with headaches, may be observed at the onset of the endocrine therapy but usually regress after the metabolism has been stabilized. If they increase progressively, the sodium chloride intake may have to be reduced.

*Bronchial Asthma and Mold Fungus Allergy. E. M. Fraenkel.—p. 115.
Flat Foot and Tibialis Anterior. M. R. Francillon.—p. 116.

Urethane Treatment of Leukemia.—Maringer reports favorably on the use of urethane (ethyl carbamate) in the treatment of a woman aged 69 who had chronic myeloid leukemia. The average daily dosage of urethane amounted to from 4 to 6 Gm. Over a period of ten weeks a total of 248 Gm. was given. A favorable effect was noticeable in the subjective symptoms, the hepatosplenomegaly and the white blood picture.

Bronchial Asthma and Mold Fungus Allergy.—Fraenkel reported that among 552 patients with bronchial asthma whom he studied in England there were 84 who gave positive skin tests with extracts of Aspergillus, Penicillium or Mucor fungi. Subsequently he found that mold fungi play a greater role as an allergic cause of bronchial asthma in England than on the European continent. This is due to the moist British climate and to the construction of the houses, and it is comparable with similar differences in various parts of the United States. The most frequent allergenic organisms were Sporotrichum types, Cladosporium, Penicillium, Aspergillus, Mucor and Monilia.

*Significance of Interstitial Lymphocytosis in Rheumatic Fever and Other Processes of Inflammation: Global Interpretation of Main Rheumatic Lesions. I. Costero.—p. 471.

Rheumatic Fever.—Rheumatic fever behaves in a different manner in young people and in adults. It has two well defined periods: the first period, which is prevalent in children and adolescents, with severe changes in the small vessels, a subacute course and death as the consequence of encephalic changes (rheumatic encephalopathy described by Gortari, Pellon and Costero); the second period, which belongs to adults and has lesions affecting mainly the endocardium, large vessels and the serous joint membranes. It has a chronic progressive course and tends to give recurrences. This period often starts after the first period and often leads to heart failure. Corresponding to these symptomatic types, rheumatic disease presents two different types of anatomic lesions: Aschoff nodules and lymphocytic infiltrations circumscribed to the organs involved, which are seen during the second period of the disease and are of unknown significance. Aschoff's nodules represent a hyperergic reaction. Lymphocytic infiltration is due to the local action of lymphocytogenic substances which originate in the atrophy and reabsorption of reticuloendothelial cells during a process of spurious inflammation. It shows permanent metabolic changes in the affected tissues. These metabolic changes are manifested not only by local lymphopoiesis but also by proliferative phenomena with histocyte differentiation.

*Periarteritis Nodosa. F. Herrera Ramos, H. Malossetti, G. J. Fernandez and J. Medoc.—p. 123.

Purpuric Syndrome with Acute Anemia in Gastric Epithelioma with Bone Metastasis. *A. Proto and O. F. Grosso.*—p. 164.

Acute Infectious Thrombophlebitis of Cavernous Sinus Following Anthrax of Ala Nasi Cured by Penicillin. A. M. Loubejac and P. Zito.—p. 184.

Periarteritis Nodosa.—Herrera Ramos and his collaborators report what appears to be the first case of periarteritis nodosa in Uruguay. The diagnosis was made on the clinical symptoms and biopsy. The symptoms consisted of rapid emaciation, articular pain, neuritis of the four limbs, nephritis without hypertension, polymorphous and hemorrhagic skin eruptions, edema, fever, attacks of asthma, nodular x-ray shadows of the lungs, which later regressed to normal, anemia and eosinophilia.

*Rare Congenital Heart Disease. L. de la Villa Rodriguez.—p. 608.

Diphtheria and Poliomyelitis. A. Curbelo, A. Clerch y Rius, E. Marrero Vela and C. Vega Aguilar.—p. 621.

Rare Congenital Heart Disease.—An infant presenting superficial respiration, gray cyanosis, bradycardia, dyspnea and low temperature died three days after birth. Necropsy showed only one ventricle, one ventricular orifice and only one artery leading from the ventricle. The ventricle was in communication with the right auricle through the auriculoventricular orifice (the only one in this case). The left auricle was represented by a rudiment showing atrophy. De la Villa Rodríguez believes that this rare abnormality is due to atrophy secondary to a complete embryonal development of the heart.

*Diaphragmatic Hernia: Clinical Study. A. Luna Olivares.—p. 57.

Diaphragmatic Hernia.—The most frequent types of diaphragmatic hernia are the esophagogastric, hiatal and traumatic. Hiatal hernia is asymptomatic in its early stages and in the late phase presents symptoms similar to those of gastric ulcer or gastric cancer. Gastric hemorrhage is frequent. The diagnosis is made by x-ray study of the stomach. Medical treatment gives good results when the hernia is still reducible. Otherwise treatment consists in resection of the herniated sac, replacement of the herniated viscera and suture of the borders of the hiatal opening. The symptoms of traumatic hernia are similar to those of hiatal hernia, but they appear early and are more acute. The diagnosis is likewise made on x-ray study. Traumatic hernias require surgical therapy. Recurrences are rare if the proper technic is followed.

*Early Diagnosis of Tonsillar Cancer. I. González-Martínez.—p. 89.

Early Diagnosis of Tonsillar Cancer.—The diagnosis of cancer of the tonsil is difficult, especially in intracryptic and palliative recess cancers. Early symptoms are unilateral local pain (of variable acuteness) of a tonsil either hypertrophic or with ulcerations, cervical adenopathy of the same side and difficult swallowing. Spitting of blood, deafness and earache are symptoms of advanced tonsillar cancer. Biopsy should be made only when one is prepared to start radium or x-ray therapy immediately after it is performed. It should be taken with the needle or the electrothermic loop. The amount of material taken should be small but still sufficient to include both neoplastic and normal adjacent tissues. Radiotherapy is the treatment of choice. It is immediately indicated if the clinical symptoms are strongly suggestive of tonsillar cancer even if the report of the biopsy is negative, in which event biopsy should be repeated in the course of the treatment. Surgical intervention is contraindicated.

Joint Disorders in Typhoid. O. A. Stracker.—p. 734.

Combination of Surprise Anesthesia and Local Anesthesia in Goiter Operations. A. Winkelbauer.—p. 737.

Biologic Procedure for Inducing Labor.—Preeclamptic and eclamptic women from whom food and fluid were withheld for therapeutic reasons often reacted to this fasting with the onset of labor pains. Hoff tried to induce labor by means of fasting in other women. He evaluates the efficacy of a forty-eight hour fast on the basis of 111 cases in which this method was tried for the induction of labor. In cases in which the fasting cure was instituted before the computed end of pregnancy the percentage of failure was high; when begun in the final week, success and failure were approximately even. In cases in which pregnancy had gone beyond term, the prospect of success was good. Multiparous women did not respond better to the fasting cure than did primiparas. It seemed that an effective fasting cure in primiparas also reduced the duration of delivery.

*Two Cases of Paroxysmal Hypertension Cured by Removal of Pheochromocytoma. F. Mandl.—p. 11.

Two Cases of Paroxysmal Hypertension Cured by Removal of Pheochromocytoma.—Mandl presents the histories of 2 men aged 33 and 41 respectively in whom removal of pheochromocytomas of the adrenals counteracted attacks of hypertension. In the first patient diagnosis was made on the basis of x-ray tomography after an operation on one side had been unsuccessful. X-ray tomography gave a positive result also in the second case. In this case permanent hyperglycemia and hyperglycosuria also were cured. As regards the clinical picture, both of the reported cases were typical for medullary tumors of the adrenals. The picture is almost identical with that of intravenous intoxication with epinephrine. There is pallor of the face, the patient feels cold and there are headaches, palpitation, tachycardia, anginal pain of the heart, nausea and increased blood pressure. The author discusses deviations from this clinical picture and describes the treatment for prevention of pronounced fall in the blood pressure, which must be instituted during the operation. The hypertensive changes on internal organs rapidly regress after the removal of the tumor. The 2 cases reported here bring the total of all cases of this type in which operations were performed to 50.

Evaluation of Electrocardiographic Records by Practitioner. O. von Zimmermann-Meinzingen.—p. 25.
*Use of Duodenal Tube in Diagnosis and Therapy of Intrahepatic Bile Passages and Other Hepatic Disorders. H. Czickeli.—p. 29.

Duodenal Tube in Infections of Bile Passages and Liver.—Czickeli stresses the great value of the use of the duodenal tube in the diagnosis as well as in the treatment of infections of the intrahepatic bile passages. Examination of the duodenal juice is frequently decisive for the diagnosis of cholangitis. Once this condition has been diagnosed, the author employs at first daily and later twice daily duodenal lavage with from 100 to 250 cc. of a 20 per cent solution of magnesium sulfate. Of 21 patients with infection of the intrahepatic bile ducts 18 were cured or at least greatly improved by the duodenal lavage, and time required for treatment was greatly reduced.

Right Bundle Branch Block (Wilson) Following Measles. E. Lyon.—p. 400.
Tropical and Phagedenic Ulcer and Desert Sore: A Review. F. Sagher.—p. 405.

Mixed Thyroidism.—Zondek directs attention to the fact that there are patients who display a mixture of practically all possible symptoms of hyperthyroidism and hypothyroidism. No satisfactory explanation for the pathogenesis of such conditions exists. He assumes that the thyroid function is abnormal probably as the result of an abnormal lobe. Treatment should depend on the predominant symptom in the clinical picture, the basal metabolic rate. In cases in which it is below normal—the change over to subnormal values sometimes takes place over a period of some years—thyroidin should be generally given in doses not larger than 0.4 to 0.5 Gm. a week, even in the presence of hyperthyrotic signs such as tachycardia, and discontinued after normalization of the basic metabolic rate at least temporarily. If the basic metabolic rate is within normal limits or above normal, the usual treatment for hyperthyroidism should be applied.

Recovery of 2 Young Children with Pneumococcic Meningitis. A. V. Westrienen.—p. 308.
Vitamin D_2 in Treatment of Lupus Vulgaris. M. K. Polano.—p. 315.

Gold Therapy in Chronic Arthritis of Children.—Halbertsma presents the histories of 6 children between 4 and 14 years of age who had chronic arthritis. He prefers the term chronic arthritis to Still's disease and to chronic primary infectious polyarthritis. Treatment consisted chiefly in intramuscular injections of a 2 per cent solution of solganal B in doses of 0.1 to 0.4 cc. given twice weekly. This corresponds to from 1 to 4 mg. of gold. After a series of ten injections one or more other series followed, each separated by a drug free interval. No accident due to intoxication was observed. All 6 children were cured. They came under treatment not long after the onset of the disease. Some had the septic type of disorder; others had few general symptoms, but in all cases the joint lesions were not serious.

Negative Roentgenoscopy in Tuberculous Necrosis of Vertebral Body.—Hellstadius reports a case which demonstrates that a caseous tuberculosis may spread widely through the medullary spaces without conspicuous injury to the osseous tissue ensuing and consequently also without any apparent changes of the vertebral body as shown by x-rays. In addition, the case proves that adjacent intervertebral disks are not necessarily involved despite wide communication between the diseased tissue and the disk. This case emphasizes the difficulties of x-ray diagnosis of tuberculous spondylitis.

Emphysematous Cystitis. R. Jönsson.—p. 1975.

Variations in Incidence of Acute Hepatitis.—In Denmark acute hepatitis occurs with seasonal variations. In 1931-1935 and 1941-1945 the variations were pronounced. Analysis of the epidemic curve according to Helge Petersen, Bjørneboe says, indicates that transmission of the infection from person to person probably does not play an important part in the form of the curve. The origin of the epidemic waves may depend on decreased resistance in the population or variations in the virulence of the infective agent. The infective agent must be assumed to be widely spread, possibly ubiquitous. Attention is called to similarities between hepatitis and poliomyelitis, both infectious diseases due to a virus, with possibility of fecal infection in both, the way of infection relatively seldom demonstrable and the maximum epidemic curve in the fall of the year, in poliomyelitis in September, in hepatitis a month or two later.

Bacteriologic Examination in Pneumococcic Pneumonia of Adults Treated with Sulfonamide.—Selberg says that of 356 cases of pneumococcic pneumonia in adults treated with sulfonamide, 289 were lobar pneumonia, and 67 bronchopneumonia. In the lobar form types 1, 2, 4, 5, 6, 7 and 8 were most frequent; in the bronchopneumonias the types established were evenly apportioned. There were 24 deaths. Excluding the 6 deaths within the first day of sulfonamide treatment, there were 18 deaths in 350 cases, or 5.1 per cent. Blood culture in 226 cases of lobar pneumonia showed bacteremia in 15.9 per cent, with a mortality rate of 17.6 per cent; in the nonbacteremic cases the mortality rate was 2.1 per cent. Bacteremia and deaths in cases with bacteremia occurred most often in patients over 65.

Complications occurred in 18.6 per cent of all the cases and in half of the cases with bacteremia. The author concludes that sulfonamides in many instances are ineffective in bilateral pneumonia and in bacteremia, especially in old persons. The sulfonamide treatment should in certain cases be supplemented with serum or penicillin.

Medical Therapy and Prophylaxis of Alcoholism. S. Izikowitz.—p. 2038.

Agglutination in Chronic Polyarthritis with Hemolytic Streptococci as Antigen.—Kalbak found positive agglutination in 154 (79 per cent) of 183 cases of chronic polyarthritis. In 400 control subjects including normal persons and patients with other medical diseases there were few positive reactions; the reaction, however, was positive in 10 of 100 cases of rheumatic fever. No positive reactions occurred in the 18 serums with high antistreptolysin titer. The antistreptolysin reaction, the author says, expresses the toxin-producing ability of the streptococci, the agglutination reaction the extent of the streptococci in the organism. If the agglutination reaction is specific in chronic polyarthritis it may mean that the disease is a form of chronic sepsis with hemolytic streptococci. The value of the reaction in diagnosis is not clear. A negative reaction does not definitely exclude the disease; a positive reaction supports the diagnosis.

Bacteriologic and Serologic Examinations of Pharyngeal Flora in Tuberculosis.—Packalén concludes that the more abundant occurrence of streptolysin-forming B streptococci and yellow staphylococci in the pharynx in tuberculous patients is hardly to be considered a relatively unimportant manifestation parallel with or resulting from the tuberculous infection in the organism. These bacteria are rather to be regarded as having an important effect on the tuberculous process.

Influence of Tonsillectomy on Healthy Kidneys and on Nephritis.—The postoperative changes in the urine found in 8 out of 80 patients with healthy kidneys were unimportant, Björk says, except in 1 instance, when a mild but persistent nephritis set in. Tonsillectomy for therapeutic reasons was done on 18 patients with acute or subacute diffuse nephritis and on 2 with chronic nephritis. In 3 patients with acute nephritis and high sedimentation reaction a definitely favorable effect on the course of the disease has resulted. Postoperative reaction in the form of pronounced increase in erythrocyturia occurred in half the cases without unfavorable influence on the course as a whole; the occurrence or absence of the reaction affords no indication of the effect of the operation. The 18 patients resumed work; 15 were subjectively well. Physical examination showed recovery in 12, latent disease in 6. Tonsillectomy in acute nephritis is to be considered in extremely threatening cases regardless of the length of time since the onset, but in general it should be resorted to only when the nephritis does not show signs of improvement after some weeks of internal treatment and should then be carried out within three months after the onset. Tonsillectomy in grave chronic conditions is not advised. Internal treatment of the nephritis must be carefully continued after tonsillectomy.

Cystic Lung in Children. B. Werner.—p. 2605.

Bradycardia.—Jervell states that the heart action was 50 or less per minute in 191 patients (139 men, 52 women) out of about 9,000 examined cardiographically from 1940 to 1945. Bradycardia due to disturbances in conduction appeared in only 18 patients (12 with disturbance in sinoauricular conduction, 6 with complete atrioventricular block). In the remaining 173 there was sinus bradycardia, usually due to increased tonicity of the vagus. The bradycardia in 105 patients with peptic ulcer and in 11 with other digestive disorders is regarded as a sign of vegetative constitution. Bradycardia with syncope may in predisposed persons depend on reflex action (sinus caroticus syndrome, vagovagal syncope). Three patients had hepatitis and 2 hypothyroidism; in 3 there was postinfectious bradycardia. The bradycardia often seen in older persons is partly of vagal origin, partly due to sclerotic changes in the heart with lowered irritability of the sinus node. Signs of degenerative heart disease were observed in 37 patients, 35 of them over 50 years of age.

So-Called Adenomas or Mixed Tumors of Salivary Glands in Bronchi.—Berdal reports 7 cases of these tumors observed at the Rikshospital during the last two years; in 5 the tumor was in a main bronchus, in 1 in a secondary bronchus, in 1 in the trachea. They are believed to have persisted for from two to twenty years; the symptoms set in between the ages of 20 and 30. In 2 instances the tumor recurred seven and two and a half years respectively after diathermocoagulation. As a rule these tumors are benign but progressive; now and then malignant development may occur. There is hemoptysis, usually repeated, in nearly all cases. An asthmatoid wheeze is often heard. The symptoms otherwise depend on the site and size of the tumor and possible pulmonary complications. Bronchoscopy is essential to allow inspection of the local conditions and to allow biopsy and planigraphy to determine intramural and extrabronchial spread. Radical surgery, roentgen-radium treatment and bronchoscopic treatment may be considered. The localization and extent of the tumor, complicating pulmonary changes and histologic type mainly determine the procedure. Six of the reported cases were treated with diathermocoagulation. Because of the risk of recurrence after conservative treatment, frequent bronchoscopy and eventually planigraphic examination is called for.

Book Notices

Aging Successfully. By George Lawton. Cloth. Price, $2.75. Pp. 266. Columbia University Press, 2960 Broadway, New York 27, 1946.

Dr. Lawton is a consulting psychologist who has long been interested in the problem of older people and who deserves credit for developing a course on "Aging Successfully" in the Adult Extension Series of the Division of Social Philosophy, Cooper Union, New York. In writing this book he has drawn on his contacts with older people of various ages and in various walks of life. He discusses in plain, easily understood language the adjustments that one needs to make in preparation for the latter half of life. An idea of the problems dealt with can be had from a few sample topics: in youth prepare for age; jobs after 50; love at maturity; can youth and age be friends? a philosophy for maturity; a private talk with your older self; a bill of rights for old age.

The theme on which the book is based is put in one sentence in chapter XI: "A philosophy for maturity must be built on the older person's maximum utilization of every ability and inner resource which will make him a more effective human being." Dr. Lawton steers a sensible middle course between the overoptimistic view that life begins with middle age and the more cynical attitude expressed by the witticism current a few years ago that after 50 everything one likes to do is illegal, immoral or fattening. He emphasizes the lesson learned in the war that the older workers can hold their own with the younger, and that the policy of forcing men to retire while in their prime is senseless and unjustifiable.

Many medical men who read the book will object strongly to a footnote following the exquisite poem "Salutation of the Dawn:" "After the death of Dr. William Osler this poem . . . was found among the papers in his desk. Dr. Osler was a great physician who was convinced that men over 60 were useless and that the remedy was chloroform." It is regrettable that a slander perpetrated more than forty years ago by yellow journalism at its worst has been thus revived. Dr. Lawton might have done his readers a greater service had he reminded them that the poem serves as the prologue to Osler's masterpiece "A Way of Life." This little volume, written when he was 64, is one of the best prescriptions for aging successfully ever written.

Dr. Lawton's book can be recommended to all people over 50 who want to make the most of their later years, and to all people under 50 who are interested in preparing for old age or who have the responsibility of caring for elderly dependents. Its easy, conversational style makes it easy to read; its understanding attitude makes it palatable; its sound advice makes it helpful.

Conférences d'actualité sur les ultravirus. Par Mm. Lemierre, Boivin, Levaditi, Mollaret, Lépine et Gastinel. Paper. Pp. 120, with illustrations. Paris & Montpellier: Librairie Maloine, 27 rue de l'Ecole-de-Médecine, Paris 6^{e}, 1944.

This is a collection of eight lectures presented in 1943 at a series of conferences arranged by the chairman of the department of bacteriology at the Faculty of Medicine in Paris. According to the introduction the conferences served to acquaint the physician and biologist with the recent interesting developments in the field of medical bacteriology. The subjects presented are infectious mononucleosis by A. Lemierre, the chemical constitution of viruses by A. Boivin, the electron microscope in microbiology by C. Levaditi, the maladie de Nicolas-Favre (lymphogranuloma venereum) by C. Levaditi, the human-equine-avian encephalomyelitis by P. Mollaret, ultravirus and cancer by P. Lépine, the immunity in the infections caused by ultravirus by P. Lépine and the biologic study of vaccinal allergy by P. Gastinel. These lectures have the character of a review. For quick orientation some possess definite value. The section on the encephalitides is the only one which carries bibliographic references in the text. It would doubtless require considerable revision to bring it up to date. Little critical evaluation of the factual knowledge is found in the lecture on immunity in virus infections. The importance of the theories on cellular immunity is supported by citing an experiment with a few guinea pigs (p. 101). The essential facts and the overemphasis of the histologic findings in the experimental lesions induced by the lymphogranuloma virus have been presented repeatedly by Levaditi in textbooks and other articles. Doubtless the most interesting lecture of the series in that of Gastinel on vaccinal allergy. However, the statement that the injection of a killed virus merely induces allergy, while a live attenuated agent stimulates both allergy and immunity, awaits further confirmation. Any one who reads French fluently will enjoy the lucid presentation offered in some of the lectures.

It's an Allergy. By Frank G. Crandall Jr., M.D., Director Allergy Clinic, University of California, Los Angeles Medical Department, Los Angeles Cloth. Price, $3.50. Pp. 318. Murray & Gee, Inc., Hollywood 28, California, 1946.

This is a comprehensive book on allergy written for the patient. It begins with a historical consideration which is brief and a discussion of the mechanism of allergy. There is a chapter on frequency of the disease followed by one on diagnosis, which includes extensive lists of common allergens among foods, pollens and miscellaneous substances, including cosmetics. The general treatment of allergy with drugs is discussed. Then follow special chapters on cosmetic allergy, hay fever and allergic rhinitis, asthma, skin allergies, digestive allergies, migraines, allergies of the nervous system, eye, ear, nose and throat, physical allergies and miscellaneous allergies. The final chapter is a well summarized piece of advice to allergic patients. There is an extensive bibliography, mostly of medical sources, which seems a trifle out of place in a book for lay persons, and a good index. This should be a useful book for patients who desire to know more about their disease. The author's discussion of treatment should not lead to self medication.

Palæontology Invertebrate. By Henry Woods, M.A., F.R.S. Eighth edition. Cloth. Price, $3; 12s. 6d. Pp. 477, with 221 illustrations. Macmillan Company, 60 Fifth Ave., New York 11; Cambridge University Press, 200 Euston Rd., London, N. W. 1, 1946.

This well known account of the fossil invertebrates differs from the preceding edition only in minor changes and additions to the bibliography. Following an introductory chapter that explains the manner of formation of fossils, the varying degrees of preservation of animals as fossils, the chemical nature of the fossil remains and the scientific and economic importance of fossils, a chapter is devoted to each invertebrate group that has furnished fossils, namely the protozoans, sponges, coelenterates, echinoderms, annelids, brachiopods, bryozoans, mollusks and arthropods. In each chapter the time honored custom is followed of giving a conventional account of the anatomy of living members, with special emphasis on skeletal structures, succeeded by a survey of the fossil members. The account of living forms thus takes considerable space; it is questionable whether this is really necessary in a paleontologic work. The fossil members receive first a general description, followed by a list of important genera with their characters and distribution in geologic time. The illustrations, not too numerous, concern both living and fossil forms. Considering the size of the book there is adequate treatment of the most important invertebrate fossil groups, namely the rugose and tabulate corals, the echinoid, crinoid, cystid and blastoid echinoderms, the brachiopods, the bivalve, univalve and ammonoid mollusks and the trilobites. Altogether the book can be well recommended as giving a clear concise account in a handy form of the fossil invertebrates.

Human Genetics. By Reginald Ruggles Gates, B.Sc., Ph.D., D.Sc. In two volumes. Cloth. Price, $15. Pp. 742; 743-1518, with 326 illustrations. Macmillan Company, 60 Fifth Ave., New York 11, 1946.

This is the first comprehensive treatment in English of the literature of human heredity. It is more compendious than the multivolumed German works in this field, and at the same time it provides more encyclopedic coverage. The extent of the material which the author has undertaken to review may be inferred from the fact that although approximately 5,000 references are cited the author claims to have included little beyond the key references for each topic. These have been for the most part judiciously chosen; and they are admirably up to date. About three fourths of the text is devoted to pathologic conditions. It is obvious that the volume will prove an almost indispensable working tool for any one directly concerned with genetic aspects of medical problems, and it will doubtless find readers among all who are interested in the total biology of disease. The author offers little critical evaluation of the material surveyed, and it must be confessed that his occasional attempts at interpretation or analysis often fail to be helpful. The introductory chapters, dealing with the general principles of human heredity, are rather unsatisfactory; they cannot compare, for example, with the treatment of similar subject matter in Roberts' Introduction to Medical Genetics. Sections touching on methodology are sometimes misleading and all together are quite inadequate to serve as a guide in the conduct of research or the interpretation of data. A commendable feature is the frequent inclusion of collateral material drawn from experimental animal genetics; the results of various of the developmental studies in particular are often suggestive of a more than superficial relevance to problems of human pathology. This work will find its chief use as a reference manual and bibliographic guide. Its value for these purposes is greatly enhanced by an excellent index of ninety pages

Les ictères: Moyens d'exploration, simptômes, physio-pathologie, thérapeutique. Par I. Pavel, maitre de conférences à la Faculté de médecine de Bucarest. Second edition. Paper. Pp. 189, with 66 illustrations. Bucarest Rumanía, 1944.

The first chapter is given to the theoretical formation of bilirubin and its secretion, which leads to a discussion of a chemical and radiologic examination with special reference to the duodenum. The usual discussion of functional icterus and its treatment together with a differential diagnosis from virus hepatitis is inadequately presented. Illustrations on pages 107 to 113 attempt explanation of the mechanism of jaundice based on histologic evidence. A consideration of the catarrhal jaundice comprises the remainder of the book, which suggests the trend and the worldwide interest in virus hepatitis. The etiology of the disease is discussed loosely as a mystery of the duodenum, the pancreas, the liver or possibly a systemic disease. Credit must be given to the careful recording of the clinical symptoms of infectious (catarrhal or virus) hepatitis leading to the full blown picture of jaundice. The relation of the liver, the duodenum, the gallbladder and the pancreas is debated inconclusively, with failure to suspect the nature of the etiologic factor. The long clinical experience of the toxic effects of protein in liver disease is discussed, but a significant exception for the tolerance and value of milk is mentioned (p. 175). The possible value of glucose and insulin is recorded, and special treatment of duodenal irritability with kaolin is reviewed. The value of this book is largely replaced by the series of articles which have appeared in the Scandinavian, British and American publications in the past three years. It is doubtful that the current drive on diseases of the liver will be aided by this volume, which was produced under the limitations of the times.

Lehrbuch der physiologischen Chemie in 29 Vorlesungen. Von Emil Abderhalden, Professor an der Universitat Zurich. Twenty-third-Twenty-fifth edition. Cloth. Price, 26 Swiss francs. Pp. 417, with 51 illustrations Benno Schwabe, Klosterberg 27, Basel 10, 1946.

Emulating his famous teacher at Basel (G. von Bunge) the author presents the subject of biochemistry in a series of twenty-nine excellently organized lectures That this plan has been successful is evident from the frequent editions which have appeared. After an introductory approach the chemistry, digestion and metabolism of the fats are considered, followed by a discussion of their related phospholipids, sterols and steroid hormones and vitamins in eight lectures. The carbohydrates and proteins are similarly treated in eleven lectures, while the vitamins, hormones, enzyme systems and mineral, nitrogenous, gaseous and energy metabolism are taken up in the remaining ten lectures. The sequence and manner of presentation follow closely the structure of the numerous organic compounds discussed. In this the author's long association with E. Fischer is evident. Probably no other textbook covers the subject from this point of view so authoritatively and with equal logic and clarity. While the author no longer cites the literature in the text, he has added a brief section giving the names of the investigators who have made the fundamental discoveries discussed in the different lectures together with the topics of their research and the date. This method has permitted a direct presentation and saved considerable space but still gives an insight into the development of the subject without taking the space required by the customary historical approach. These changes were brought about largely by the fact that in the present edition the author was restricted to one small volume. He is to be commended on how well he has been able to present the subject in the small space allotted.

The Diabetic A B C: A Practical Book for Patients and Nurses. By R. D. Lawrence, M.A., M.D., F.R.C.P., Physician in Charge Diabetic Department, King's College Hospital, London. Ninth edition. Boards. Price, 4s. Pp. 79. H. K. Lewis & Co., Ltd., 136 Gower St., London, W C. 1 1946.

The primary purpose of this little manual, according to the author, is to confine itself to practical details, to show the diabetic patient how to live easily and comfortably, as well as healthily. Difficulties of understanding diabetes, doses of insulin, the three strengths prepared, methods of injection and signs of insulin overdose are gently ironed out so as to make them simpler for the patient to understand. Instructions and planning of diets are adequately and simply discussed under Diet-Line-Ration-Scheme, a method made popular in England but not in America. The numerous recipes for diabetic patients are also carefully planned and prepared. Since persons with diabetes are liable to the same illness as other people the section on what to do when ill will help to clarify many problems of care—diet and insulin—for diabetic patients during illness. The author is still in doubt concerning the merits of the third type of insulin, globin zinc insulin, when he states that "it is a delay action insulin, supposed to be intermediate in action between protamine zinc insulin and soluble insulin, . . . but its exact place in treatment is not yet fully established." Surely an insulin which has been in practical use over two years has established its merit. After all, globin insulin is merely an insulin with added globin and zinc, having a prolonged action of twelve to eighteen hours, whereas protamine zinc insulin lasts over twenty-four hours and plain insulin only four to six hours, facts established by clinical evidence. Generally speaking this book is an excellent accomplishment and may be recommended for the diabetic patient.

A Manual of Tomography. By M. Weinbren, B.Sc, M.R.C.S., L.R.C.P. Fabrikoid. Price, 45s. Pp 270, with 397 illustrations H. K. Lewis & Co., Ltd., 136 Gower St., London, W. C. 1, 1946.

This is described as a summary of the author's seven years' experience with linear tomography. After a rather brief introduction the writer deals with tomography in the chest, spine, skull, larynx and miscellaneous anatomic regions. There is then a fairly long chapter on technic, a list of references and an index. As is customary with studies of a special nature, the author overextends himself in an attempt to demonstrate the usefulness of the method For example, figures 3, 6 and 7 are reproductions of films alleged to show merely a "suggestion" of pulmonary cavity, while the respective succeeding illustrations are tomograms "revealing" clear demonstration of cavity. We believe that an experienced interpreter would not have needed body section films in these particular cases in order to diagnose cavity.

Figure 84 is an illustration of ankylosed sacroiliac joints and 84-a is a tomogram of the same case; we do not believe that it adds any particular information. The author's illustrations of tomograms of the thorax in the oblique position are quite instructive from the anatomic point of view but are of doubtful value from the clinical diagnostic aspect. He reproduces tomograms of the urinary tract and gallbladder, an extension of the method of very dubious value.

The pages on tomography of the temporomandibular joint and of the larynx are quite poor; this is surprising, since it is in these two areas that the method has the most usefulness.

With characteristic British candor the author states in the preface that he had no intention of publishing a book on tomography! He had prepared six hundred slides for a lecture on the subject to be given at Capetown, but "time did not permit more than half that number to be shown." The book is printed on good paper, and the quality of most of the illustrations is sound; the references are not complete, several of them lacking titles. There is a good index. We believe it is fair to label the work a labor of love but not a source of valuable information, even to tomographiles.

Queries and Minor Notes

The answers here published have been prepared by competent authorities. They do not, however, represent the opinions of any official bodies unless specifically stated in the reply. Anonymous communications and queries on postal cards will not be noticed. Every letter must contain the writer's name and address, but these will be omitted on request.

THE SMOKE NUISANCE

To the Editor:—I am a committee member of the Croton Rotary Club and I have been delegated to meet with the Croton Civic Association with regard to the smoke nuisance created by the Harmon railroad yards of the New York Central in our community. I would greatly appreciate a few comments from you with regard to what injuries are possible to the community from the smoke liberated by the railroad yards and the numerous coal-steam engines. I would be grateful for any comments which might help in our future meetings. Samuel Kahn, M.D., Brooklyn.

Answer.—The coal-burning steam locomotive constitutes one of the most serious single health menaces in the urban air pollution picture. This is particularly true for heavily industrialized cities located in regions prone to natural large scale fogs or to nocturnal fogs from a hill and valley topography such as one sees at Cincinnati and Pittsburgh. Coal-burning steam locomotives contribute (1) carbon particles, which would be harmless if pure but which have condensed on them varying loads of tars, some of which have been found definitely cancerigenic in animals; (2) fly-ash, which is probably more damaging than carbon soot to the human respiratory tract, especially in setting up chronic irritative states; (3) noxious gases, especially the oxides of sulfur, which form corrosive acids when dissolved in water, and (4) exhaust steam, which itself is not harmful but which is liberated into cold winter air in far greater amounts than the air can hold as invisible water vapor and hence must remain as a steam cloud. During stable winter weather phases of low air motion there is often formed a stratified ceiling 500 to 800 feet above the ground. Into this pocketed air mass the locomotives exhaust their steam and polluting materials. Natural fog tendencies are thus greatly accentuated, and the suspension and rapid accumulation of all flue products in this surface fog mass leads quickly to "smogs" and a dangerous atmosphere for the people to breathe. A recent U. S. Public Health Service survey (The Journal, Feb. 1, 1947, p. 334) indicated that about a fourth of the total pollution in the Chicago area is contributed by the coal-burning steam locomotives, but their output of exhaust steam to hold the polluting materials suspended easily gives them a first place as a public health menace. Their percentage contribution would be much higher if only the industrialized parts of the city were considered.

Death rates from pneumonia, tuberculosis and respiratory tract cancer provide a clear index of the damage air pollution inflicts on a city's population. All three of these diseases show a much higher death and incidence rate in badly polluted areas. This increase takes place mainly in the men who are out in the polluted atmosphere a greater portion of each day. The relation between sootfall and respiratory disease death rates is highly significant on a statistical basis and should lead public health and housing authorities to a keener appreciation of the importance of air pollution in the high respiratory disease death rates of slum populations. Interest in air pollution and the steam locomotive's contribution is becoming keen and countrywide. Diesel engines provide the best answer to this phase of the problem, for with them the emission of water and solid particles is reduced to a minimum.

TUBERCULOUS IRITIS

To the Editor:—A woman under my care is being treated for congenital syphilis with oxophenarsine hydrochloride and a bismuth compound. During the course of treatment an iritis of the left eye developed. She was seen in consultation by several ophthalmologists who, after a thorough investigation and examination, insist that it is nonspecific in origin. I am now investigating her for a possible tuberculous focus. Is it possible to have an iritis develop as a result of the antisyphilis treatment mentioned?

M.D., New Mexico.

Answer.—No. It is not possible to have endogenous tuberculous iritis develop without the presence of a tuberculous infection somewhere else in the body.

Furthermore, it is not possible to induce any form of iritis by the use of any drug, unless it is applied directly to the eye.

ANTERIOR PITUITARY AND OVARIAN EXTRACTS NOT ABORTIFACIENTS

To the Editor:—A woman was seen in October 1945 who gave a history of amenorrhea for six to twelve months prior to this date. A diagnosis of pregnancy was not established. However, she was told that there was a possibility of pregnancy. It is now known that she was pregnant one month at this time. In December 1945 she was given Anterior Pituitary and Ovarian Extract (Sherman Laboratories, Detroit) containing 18½ grains of anterior pituitary fresh tissue and 40 grains ovarian fresh tissue. The Anterior Pituitary and Ovarian Extract was administered after a flat plate of the abdomen had failed to disclose that a fetus was present. The patient was given six ampoules on alternate days for what was thought to be a functional amenorrhea. Bleeding did not ensue. The medication was not given with the intention of producing an abortion. The patient was instructed fully that it had not been determined whether or not she was pregnant. The patient is now bringing suit, stating that the drug was given as an abortifacient. Is it possible that anterior pituitary and ovarian extracts will make a pregnant woman menstruate?

M.D., West Virginia.

Answer.—There is no known drug or hormone which will produce abortions in normal cases, else the abortionists would have little to do. Even potent standardized pituitary preparations such as posterior pituitary injection cannot produce an abortion when the ovum is normal and normally implanted in the uterus. The anterior pituitary obtained from fresh tissue is most likely not as potent as posterior pituitary injection and hence it too cannot produce an abortion in a normal pregnancy. Likewise the ovarian substance which was administered to this patient could not have any effect in inducing an abortion.

ANTIBACTERIAL EFFECT OF SULFONAMIDES

To the Editor:—There seems to be disagreement as to the effect of sulfa drugs on various organisms. Lowsley and Kerwin state that sulfanilamide is not effective for Bacillus proteus, while sulfathiazole is effective against Streptococcus fecalis. Everett states that sulfonamide drugs are effective against all types of organisms commonly found in the urinary tract with the exception of alpha Streptococcus fecalis. Dodson states that sulfanilamide is more effective against streptococcus and B. proteus, while sulfathiazole is more effective against staphylococci. Dr. Harry Gold in Conferences on Therapy in the *New York State Journal of Medicine* for May 1, 1944 says that practically all common varieties of organisms found in urinary tract infection responded to sulfonamides except B. proteus, nonhemolytic streptococcus and tubercle bacilli. Please clarify this, with particular attention to B. proteus and Streptococcus fecalis.

C. K. Pearlman, M.D., Huntington, W. Va.

Answer.—It is obvious that experience in various clinics reflects differences of opinion concerning the antibacterial effect of the sulfonamides against the several species of bacteria causing infections of the urinary tract. It is generally regarded that Escherichia coli is sensitive to all the commonly used sulfonamides, but some strains of E. coli have been proved in vitro to be highly resistant to these drugs. In general, strains of B. proteus are highly resistant to sulfanilamide, sulfathiazole and sulfadiazine, and urinary tract infections due to this species do not respond favorably to treatment. This also applies to infections due to Streptococcus fecalis. Not uncommonly, strains of staphylococcus are highly resistant to the sulfonamides, as well as some strains of Streptococcus viridans.

HYDROCHLORIC ACID THERAPY

To the Editor:—Recently a paper entitled "Hydrochloric Acid and Mineral Therapy," by the late Walter B. Guy of St. Augustine, Fla., has come to my attention in which many extravagant claims are made. Can you inform me if it is safe to employ this treatment intravenously or intramuscularly and if it has any therapeutic value? M.D., Florida.

Answer.—Hydrochloric acid therapy has been tried intermittently for the past twenty years in a wide variety of conditions, mostly in infectious diseases. Twelve years ago a critical discussion of this work was published (The Journal, Feb. 17, 1934, p. 534), and nothing has transpired since then to alter the views expressed in the conclusion of that article: (*a*) Any alleged therapeutic effect is, in all likelihood, produced by alteration in blood colloids, such as hemolysis; (*b*) it has not been demonstrated beyond reasonable doubt that an appreciable leukocytosis is produced by such injections; (*c*) the reputed causative relationship of the alleged leukocytosis to clinical improvement is derived entirely from so-called post hoc reasoning and remains unproved; (*d*) adequately controlled evidence of clinical benefit from such treatment is completely lacking.

In the concentrations usually employed (1:3,000) hydrochloric acid has not been reported to cause harmful effects if not more than 10 cc. of such a solution is injected at one time. Of course, rigid asepsis must be observed, since the acid reaction produced locally favors bacterial growth.

CAROTID SINUS REFLEXES

To the Editor:—Last year, while I was descending the stairs after a call, a holdup man caught me from the side and pressed his arm around my neck. I became unconscious instantly. When I awoke I found myself on the landing of the floor below minus my money but perfectly sound in mind and body as if awakening from a deep sleep. Except for a few seconds of wonderment, my mind was perfectly clear. There was no pain, no tenderness nor marks of constriction round my neck. I know of similar cases without fatality or bodily injuries. Evidently the compression of the carotid vessels produced a partial anoxia of the brain—partial, because the circulation through the vertebral arteries was not obliterated. How long can pressure on the carotids with consequent partial anoxia of the brain and unconsciousness be maintained without danger? Could such a procedure be used for anesthesia? Such anesthesia would be rapid, simple and without any after-effect. A machine (like the Tycos) could be constructed with two longitudinal pads or compressing balloons to be applied to the sides of the neck back of the trachea. M.D., New York.

ANSWER.—Unconsciousness produced in the manner described in the query is almost always the result of reflexes from the carotid sinus and not of obliteration of the carotid arteries with resulting cerebral anemia. Mechanical stimulation of the carotid sinus sets up reflexes which after passing through various cerebral centers affect the pulse and blood pressure. The bradycardia and hypotension thus produced may cause temporary loss of consciousness. In addition, fainting may occur from the so-called cerebral reflex (Weiss, Soma; Capps, R. B.; Ferris, E. B., Jr., and Munro, Donald: Syncope and Convulsions Due to a Hyperactive Carotid Sinus Reflex, *Arch. Int. Med.* **58**:407 [Sept.] 1936).

Stimulation of the carotid sinus is not a satisfactory method of producing anesthesia because it is too transitory and because prolonged stimulation may be distinctly dangerous. It should be mentioned that this reflex is frequently taken advantage of in jiujitsu and other methods of so-called self defense.

AUTOLESIONISM

To the Editor:—A young woman for the past ten years has had an ulcerated area on the upper part of the left arm which has been recalcitrant to various forms of treatment and extremely painful to the slightest touch. Only aquaphor or boric acid ointment is tolerated as medication. She has been seen by dermatologists and neurologists in skin clinics, in hospitals and at dermatologic meetings. A diagnosis of dermatitis factitia has been made more than once with the added statement that this diagnosis was offered in place of 'etiology unknown.' The patient has never asked compensation and denies injuring herself. Further she reiterates "How can I scratch my arm if the slightest touch makes me scream?" The following neuropsychiatric questions arise: Are autolesionists, as a rule, hyposensitive to pain so that they can stand severe mutilations without pain or with pleasure? How many autolesionists are hypersensitive to pain? Would hypersensitiveness to pain rule out autolesionism? M.D., Rhode Island.

ANSWER.—Some people, because of a variety of psychologic reasons, mostly representing aggressive impulses repressed and turned against themselves, inflict lesions on their skin. Some autolesionists are hysterical personalities, some are psychotic. In the latter group the skin lesion inflicted may have special bizarre symbolic significance. A majority of autolesionists are hyposensitive to self-inflicted painful stimuli and some few may even derive pleasurable feelings from such acts. However, hypersensitiveness to pain does not rule out the possibility of autolesionism.

GANGRENE OF BOWEL AND MESENTERIC BLOOD SUPPLY

To the Editor:—What is the shortest length of mesentery that can be detached from a loop of ileum and produce gangrene of the bowel wall? What visible changes will appear in the bowel wall to indicate loss of blood supply sufficient to cause gangrene and how soon after detachment will these changes appear? M.D., New York.

ANSWER.—In this problem experimental work on animals cannot be applied to man because of the difference in the anatomy of the mesenteric blood vessels. Even in man the variations are so great that resection of a similar extent of mesentery in 2 cases will not produce the same results. One of the main features to be taken into consideration is the site at which the mesentery is detached. If it is removed immediately at the wall, roughly 7.5 mm. can be safely detached without ensuing necrosis. Anything over this figure could produce impairment of nutrition of sufficient severity to cause localized gangrene. If the wound in the mesentery is some distance from the wall, collateral circulation is sufficient to maintain nutrition. A transverse tear of 3 inches occurring 1½ inches from the ileum has produced gangrene of 6 inches of bowel.

Whether impairment of the circulation will be enough to produce gangrene is a difficult problem. The extremes are easily dealt with. It is the intermediate cases that cause the trouble. Even wide experience and excellent judgment may on occasions prove faulty. After detachment of mesentery at the wall, color changes occur almost immediately. As the defect is produced farther away from the wall the changes take longer to occur, depending on the efficiency of the collateral circulation, so that fifteen minutes or longer may pass before signs of moderate ischemia occur. The visible changes are cyanosis, loss of normal sheen, lack of peristalsis and loss of pulsation of vessels. Color changes eventually become more evident, and the typical picture of necrosis is produced. If the patient is given pure oxygen by mask and if warm packs are applied, one may find that there is some return of circulation and a smaller extent of the bowel is compromised. The fluorescein and procaine tests have proved efficacious in some hands in determining the eventual viability of the bowel.

IRRADIATION OF ADENOIDS

To the Editor:—Please discuss the use of radon for the treatment of hypertrophied adenoid tissue. What are the indications, contraindications, method of application, dosage, and the earliest age at which this has been used? Is there any danger of irradiating other tissues than the adenoid, for example, the pituitary gland or other deeper tissue? M.D., New York.

ANSWER.—Irradiation of nasopharyngeal lymphoid tissue is now common practice. This form of therapy apparently has its greatest usefulness for the treatment of small collections of lymphoid hyperplasia in and about the pharyngeal orifice of the eustachian tube which swell and produce edema within the tube and by this process produce secondary changes within the middle ear and hearing loss. In some instances this nasopharyngeal condition may account for congestive changes in the nose. Symptoms produced by the effect of hypertrophied adenoid tissue in small children have responded favorably to small amounts of irradiation. It has been used in children as young as 2 years of age.

Some of the first observations on the effect of irradiation of nasopharyngeal lymphoid tissue were made with applicators containing radon. This is not generally available, and it was found that radium filtered to provide the more caustic beta rays would give the same result. The beta rays are more caustic than the gamma rays but do not penetrate as deeply. With the use of the former, however, it was found that the clinical result was the same on lymphoid tissue in contact with the applicator as compared with the gamma rays (Boies, L. R.: Irradiation of Nasopharyngeal Lymphoid Tissue: An Evaluation, *Arch. Otolaryng.* **44**:129 [Aug.] 1946). The advantage of utilizing the beta rays lies in the fact that a small amount of radium is sufficient for a short period of irradiation.

Several companies now furnish applicators for this irradiation. The applicator is passed through the nostril until the radium is over the eustachian orifice of the side to be treated.

With this method of application and dosage there is no danger of irradiating tissue outside the nasopharynx, such as the pituitary gland. The effect of this irradiation on the lymphoid tissue is not a grossly destructive one. It has been referred to as a "biologic" effect by S. J. Crowe (*Ann. Otol., Rhin. & Laryng.* **53**:227 [June] 1944), who has described the effect of irradiation as follows:

"The action of the irradiation is to inhibit mitosis in germinal centers and thus stop the formation of new lymphocytes. Observation of hyperplastic lymphoid tissue under this treatment leads us to believe that lymphocytes, like the skin cells, have a brief life cycle, probably not more than two weeks. Under irradiation treatment no new lymphocytes are formed to replace those discarded and the mass gradually shrinks and disappears."

However, the effect on any considerable amount of lymphoid tissue is negligible, and surgical removal is indicated if there is any sizable mass of tissue.

RECURRING ERYSIPELAS-LIKE ERUPTIONS

To the Editor:—I am writing in regard to the discussion of the treatment of recurring erysipelas-like eruptions of the extremities (The Journal, March 1, 1947, p. 655). I have found that local treatment is ineffective. If the patient exhibits no intolerance to the drugs, 0.5 Gm. of sulfadiazine or sulfathiazole orally twice a day for a period of a minimum of six months will prevent recurrences. An occasional patient will require even more prolonged prophylactic treatment.

SURGICAL ASPECTS OF BRONCHOGENIC CARCINOMA

JOHN C. JONES, M.D.
Los Angeles

In the past thirteen years, since Graham[1] performed the first pneumonectomy for carcinoma of the lung, one can safely state that the development of a safe surgical technic for pneumonectomy has far surpassed the clinical advances for the earlier diagnosis of this lesion. Since carcinoma of the lung contributes 10 per cent of all adult male cancers coming to autopsy and is second only to carcinoma of the stomach, it behooves the clinician to bend every effort to diagnose the disease earlier if a successful surgical cure is to be secured. The low surgical mortality of pneumonectomy should be a vital stimulus to all of us to make an early diagnosis of a common disease that can be cured only by surgical extirpation.

The actual incidence of the disease is on the increase, according to reliable statistics. The greatest number of cases occur between the ages of 40 and 60 years, as is true in other carcinomas, and there seems to be a slightly greater number that occur in the right lung than in the left. There is a great preponderance of male incidence over the female, some reporting 4 to 1, while in our series the incidence was 6 males to 1 female.

SYMPTOMATOLOGY

The symptoms are essentially the same as those of inflammation and depend on the location and size of the tumor and the degree of obstruction and ulceration of the bronchus. The great majority (80 to 90 per cent) of the patients complain of cough as the earliest symptom. Frequently they volunteer that they have a dry "cigaret cough," which later usually becomes productive of mucoid sputum. As the lumen of the bronchus becomes obstructed, the retained secretions become infected and the cough yields purulent sputum. Chills and fever are an indication of the retention of infected secretions, and a diagnosis of pneumonia, pneumonitis or influenza is a frequent early erroneous diagnosis. These symptoms are usually relieved by the raising of sputum only to recur in a few days or weeks.

Pain is the second most common symptom; it varies from a discomfort, feeling of tightness, oppression or a characteristic pleuritic pain of varying degrees to the severe intractable pain due to the tumor invasion of the brachial plexus and the intercostal nerves. Severe pain is usually indicative of mediastinal, pleural or chest wall involvement and inoperability.

Hemoptysis occurs in more than half of the patients. There is nothing characteristic about it; slight or occasional streaking all the way to fatal hemorrhages may occur. Bleeding is frequently in direct ratio to the amount of infection and ulceration. Tumors arising far out in the bronchial tree become infected later than those occurring in the major and secondary bronchi and are less apt to cause hemoptysis. It is not unusual for patients to deny raising blood but on careful questioning admit occasional blood streaks in their mucoid sputum.

Weight loss is a rather constant complaint, and except in patients emaciated, with obvious metastases, is usually greater in the patients who have considerable infection complicating the tumor. Weight loss is then not in itself an important indication of operability.

Wheezing, at first intermittent, sometimes becoming constant for a while, then suddenly disappearing with a complete occlusion of the bronchus by the tumor, is a common complaint. Here again this is usually elicited by careful questioning of the patient.

Dyspnea occurs in about a fifth of the patients and may be due to atelectasis but more commonly accompanies the pleural effusions. The vast majority of effusions are an indication of carcinoma of the pleura, but occasionally they are due to the underlying inflammation of the lung.

Clubbing of the fingers and toes may be observed early in the disease before any symptoms referable to the intrathoracic disease are observed. It is frequently seen later in the course of the disease and is of no particular significance.

Hoarseness is occasionally noted as the first symptom and signifies inoperability, for the cancer has invaded the mediastinum to involve the recurrent laryngeal nerve.

It is not unusual for a patient who has no symptoms referable to the lungs and no physical findings on examination to have a routine roentgenogram which reveals a small pulmonary lesion which has already metastasized either to the skeletal system, the central nervous system or other organs. For this reason neurosurgeons have for a long time routinely x-rayed the chests of all patients suspected of having a brain neoplasm.

Late manifestations such as hoarseness, Horner's syndrome, phrenic nerve paralysis, intractable pain with involvement of the intercostal nerves and the

Read before the joint meeting of the Section on Laryngology, Otology and Rhinology and the Section on Radiology at the Ninety Fifth Annual Session of the American Medical Association, San Francisco, July 5, 1946

[1] Graham, E. A., and Singer, J. J.: Successful Removal of an Entire Lung for Carcinoma of the Bronchus, J. A. M. A. **101:** 1371 (Oct. 28) 1933

brachial plexus and the cervical, axillary and supraclavicular metastatic lymph nodes are of little significance in making the diagnosis and indicate only a state of inoperability.

PHYSICAL EXAMINATION

After a careful history is elicited, the physical examination will yield findings varying according to the location and extent of the lesion and its atelectasis, the extent of the infection and the presence of metastases. Expansion of the hemithorax is decreased, and there is a noticeable lag on respiration. Careful palpation for metastatic lymph nodes in the cervical, supraclavicular and axillary areas is most important. Auscultation over the trachea with the stethoscope may reveal a wheezing respiration. Dulness on percussion with suppressed breath sounds over the involved area is a common finding. The presence of rales will depend on the degree of obstruction and the extent of the secondary infection.

DIAGNOSIS

The relatively late diagnosis of carcinoma of the lung is due either to a patient seeking medical advice long after the onset of his symptoms or the physician's failure to recognize the importance of the patient's complaint and carrying out the necessary diagnostic measures. All too often carcinoma masquerades under the erroneous diagnosis of atypical or virus pneumonia, and frequently the correct diagnosis is long delayed by the temporary clinical improvement in the patient in response to repeated sulfonamide and penicillin therapy. Clinical improvement following chemotherapy without a complete roentgenologic clearing of a bronchopulmonary lesion in an adult is indicative of at least a tentative diagnosis of primary bronchogenic new growth until proved otherwise.

The sputum should be examined for tubercle bacilli. Recently there has been increasing emphasis on the search for tumor cells in the sputum, but this requires time consuming and tedious methods which may not be productive of cells in the presence of a growth. More recently Herbut and Clerf[2] have reported the value of stained bronchial smears in lesions beyond the vision of the bronchoscope.

Roentgenography is the greatest single diagnostic aid at our disposal, and it suggests the diagnosis in the vast majority of cases. The tumor itself may cast the entire shadow where the lesion (peripheral) arises farther out in the bronchial tree. A tumor arising in a primary or a secondary bronchus (central lesion) does not cast a distinct shadow of its own but one of atelectasis. Finally, a third type of roentgen manifestation may be evidence due to bronchiectasis, abscess or pleural effusion secondary to the primary tumor. There are no characteristic roentgen features of bronchogenic carcinoma, for it may simulate all types of lesions, such as bronchiectasis, tuberculosis, lung abscess, lymphoblastoma, benign tumor, pneumonia and pleural effusion. Careful fluoroscopy and lateral and oblique roentgenograms are frequent necessary diagnostic aids. Only in certain selected cases is bronchography indicated; namely, where the tumor is small and the bronchoscopy has not aided in the diagnosis, and a filling defect is searched for in the bronchus outlined by the iodized oil. The injudicious use of bronchograms not infrequently flares up an acute pneumonitis in the infected cases with retained secretions. Tomograms or planigrams have been of great aid to us when the lesion was well beyond the vision of the bronchoscope and biopsy was impossible. They reveal partial or total bronchial obstruction characteristically inside the outline of the tumor shadow and are indicated when the bronchoscopy yields no information.

Bronchoscopy is the next most important diagnostic aid and is the easiest and most accurate method of early diagnosis. A biopsy should be taken if possible to clinch the diagnosis. Bronchoscopy may yield important information, such as narrowing and fixation of the bronchi, even though the tumor arises beyond the visual field of the bronchoscope. Operability may be determined at the time of bronchoscopy, and the retained infected secretions may be aspirated to improve the patient's condition for the anticipated surgery should the latter seem feasible. In between 60 and 75 per cent of the cases bronchoscopy will yield diagnostic tissue for a biopsy or information leading to a presumptive diagnosis.

Needle biopsy of the lung has been advocated but is mentioned only for the purpose of condemning it. Hemorrhage, infection and extension of the tumor along the needle track are serious complications contraindicating its use.

In cases in which the history and diagnostic measures indicate a presumptive diagnosis of carcinoma of the lung, but positive tissue biopsy has been unobtainable, exploratory thoracotomy is definitely indicated. The safety of the surgery and its great advantages over the limitation of thoracoscopy far outweigh any of the advantages of the latter procedure as a diagnostic aid.

PATHOLOGY

It is now generally agreed that all cancer of the lung arises from bronchial mucosa and is of a high grade of malignancy. There are, generally speaking, three groups or classifications; squamous cell (epidermoid), adenocarcinoma and undifferentiated cell types. The squamous cell carcinoma occurs more frequently than do the others. It apparently has a slower course, and the incidence of metastases is lower. It is therefore the more favorable type for operability and offers the best prognosis from the standpoint of a surgical cure. Adenocarcinoma and undifferentiated carcinoma are much more rapid in their progress and have a higher incidence of metastasis and a much lower surgical operability and therefore a poorer prognosis. Since the cell type of carcinoma is frequently found to be different in the tissue taken from the lung as compared with the bronchoscopy biopsy, the question of operability and prognosis cannot be decided by the study of the bronchoscopy biopsy alone, and, if the tumor is resectable, every effort should be made to carry out a total pneumonectomy with resection of the mediastinal lymph nodes, even though adenocarcinoma or undifferentiated cell carcinoma is diagnosed on the biopsy.

TREATMENT

Roentgen therapy at best offers the patient only palliation in lesions that are radiosensitive and is reserved for cases that are inoperable. Total pneumonectomy with resection of the regional mediastinal, subcarinal and azygos lymph nodes is the only operation that offers a cure. The incidence of recurrence following lobectomy is convincing evidence that pneumonectomy should be done where it is feasible. Exploratory thoracotomy with a view of proceeding with a pneumonectomy in cases not proved by biopsy is an entirely safe procedure. In the group in which the lesions were inoperable, none of the patients died as the result of the exploration of the thorax alone.

[2] Herbut, P. A., and Clerf, L. H.: Bronchiogenic Carcinoma, J. A. M. A. **130**: 1006 (April 13) 1946.

PREPARATION AND ANESTHESIA

The usual preparation of the patient for pneumonectomy is essentially the same as is indicated in other major surgical procedures. Penicillin inhalations and sulfadiazine orally are administered to control infection if the patient is febrile or if he has considerable purulent secretions. Blood transfusions have occasionally been necessary preoperatively. Bronchoscopic aspiration of retained purulent secretions may be necessary to relieve the inflammatory process in the lung where the secretions are retained by blockage of the bronchus. Penicillin intramuscularly may be needed when the occlusion of the bronchus reduces the efficiency of the inhalation method. Preliminary pneumothorax is no longer considered worth while and is not employed.

Intratracheal anesthesia with a closed system is utilized routinely. Some prefer induction with pentothal sodium followed by nitrous oxide and ether-oxygen; others prefer cyclopropane throughout, and still others are advocates of either pentothal or cyclopropane induction, then going on to ether-oxygen for the duration of the operation. The important aspects of the anesthesia are a clear airway that gives access to frequent catheter aspirations of the purulent secretions throughout the operation to prevent a spill-over to the opposite good lung, and an anesthesia which gives a high exchange of oxygen to the patient throughout the operation. I prefer a pentothal sodium induction followed by ether-oxygen anesthesia after the intubation of the tracheal catheter.

After the operation, all the secretions in the tracheobronchial tree are aspirated by catheter while the patient is turned on his back, and then on his operated side with the healthy lung uppermost in order to empty out any secretions that may have gravitated to the upper lobe of the remaining lung. Aspiration of each of the remaining lobes with the curved Thompson catheter is continued through the endotracheal tube until the entire lung is dry to auscultation with the stethoscope.

OPERATION

The patient is placed on his good side with a 15 to 20 degree depression of the head of the table to promote drainage toward the intratracheal catheter. Through a posterolateral incision, usually the fifth or sixth rib is resected and the ribs are spread apart without further rib resection. The hilus is dissected out, the regional lymph glands are removed, either individually or with the lung, and all the vessels are individually ligated without the use of the tourniquet. Finally the main stem bronchus is cut across close to the carina after two guide sutures of alloy steel wire have been placed to secure the bronchial stump. With traction on the two guide sutures, seven or eight interrupted 35 gage alloy steel wire sutures on atraumatic needles are placed and tied over the end of the stump so as to approximate the membranous posterior bronchial wall to the anterior cartilaginous portion. No other sutures are taken except fine silk ligatures in the bronchial vessels. After the pleural cavity is thoroughly rinsed with saline solution, 2 Gm. of sulfapyridine powder or sulfanilamide crystals is sprayed over the raw surfaces of the mediastinum, and the mediastinal pleura is closed. If this is not feasible, a flap of pleura is dissected and turned over the stump and sutured in place covering the end of the stump. In all, 2 to 5 Gm. of sulfanilamide crystals and in addition 50,000 or 100,000 units of penicillin in 100 cc. of saline solution are left in the pleural cavity. The chest wall is closed in layers without drainage, and finally enough air is aspirated from the pleural cavity to establish a negative intrapleural pressure. Throughout operation and afterward the patient receives blood transfusions equivalent in volume to more than replace his blood loss.

RESULTS

In the past four years 196 cases of bronchogenic carcinoma have been seen and diagnosed. By virtue of metastases and other causes, 119 cases (61 per cent) were considered inoperable; 78 patients (39 per cent) were advised to have exploration and pneumonectomy if feasible; 66 patients (84.5 per cent of 78) accepted operation. Of these, 27 (41 per cent of 66) were inoperable and had only exploratory thoracotomy, none of whom had complications, and there were no hospital deaths in this group.

Thirty-nine patients (20 per cent of 196, 59 per cent of 66) had pneumonectomy. Among these, 2 (5 per cent of 39) died in the hospital. There were 37 of the 39 (95 per cent of 39) who survived the pneumonectomy and were discharged from the hospital in good condition. Eleven patients (29.5 per cent of 37) have since died of recurrence of the growth or metastases or other causes. Twenty-six of the 37 patients surviving pneumonectomy are alive, and several of these will probably die of recurrence of metastases.

SUMMARY

In 196 cases of carcinoma of the lung, only 39 per cent were clinically operable, and when exploration in 66 cases of this group was done only 39 (59 per cent of 66, 20 per cent of 196) were operable and had pneumonectomy. Of these patients 2 (5 per cent of 39) died in the hospital, and 11 (29.5 per cent of 37) died later. Twenty-six patients (70.5 per cent of 37) remain alive, and a number of these will probably die of recurrence or metastases.

Only the early diagnosis and early resection can elevate the appallingly low operability and curability rate. Certainly the low surgical mortality (5 per cent) in this series of pneumonectomies is as low as if not lower than that of surgery in carcinoma of other organs. An otherwise fatal disease, curable with a 5 per cent mortality rate, is a challenge to the profession to make the diagnosis earlier. The absence of deformity resulting from the surgery should decrease greatly the refusals for operation.

ADDENDUM

Since submitting this paper I have completed thirteen additional pneumonectomies for carcinoma without mortality. A total of fifty-two pneumonectomies with two hospital deaths yields an actual operative mortality of slightly less than 4 per cent.

1136 West Sixth Street.

ABSTRACT OF DISCUSSION

Dr. B. V. A. Low-Beer, San Francisco: Dr. Jones pointed out the ambiguity of the early clinical symptoms. The great problem in this field is the early diagnosis. Clinical symptoms which in daily practice may seem to have no definite significance have to be individually evaluated with the possibility of bronchogenic carcinoma in mind. The part which we have to play in this grave problem of bronchogenic carcinoma is to turn the medical profession's and the public's attention to the fact that a cough does not mean simply a "cold," but it might be a grave symptom indicating something more serious. Bronchial smears should be employed more frequently; we should encourage the use of this method. As to the value of the roentgen examination, usually when there are roentgenologic signs the percentage of operability decreases considerably. The earlier we catch these signs the better the outlook for diagnosis and surgical procedure. The expansion of chest surveys will prove of great value. The statistical analysis of the 196 cases is excellent. Even the most critical biostatistician can't find fault with Dr. Jones's evaluation. Approximately 13 per cent have proved operable and so far deaths have not occurred after pneumonectomy in his series. Though this is a fair result, we all strive for a higher salvage rate. Dr. Jones pointed out that radiation therapy is merely a palliative method. I am always at a loss when I am asked to treat palliatively. Am I expected to treat for pain or am I to try to change the kinetics of the tumor cells? This requires two entirely different energy quantities to be delivered to a lesion. In every case we should, after a pneumonectomy, give the patient the chance of judicious radiation therapy. That means to deliver a dose of 4,000 to 6,000 roentgens to the mediastinum. It can be done without untoward effect. It was said today that radiation cannot destroy metastases in lymph nodes. I do not agree entirely with such a statement. But even if this were correct, we might produce fibrosis, encapsulate the nodes and keep them dormant. Radiology and surgery are not competitive methods. It is not a question of deciding for one against the other, but much more for one with the other.

Dr. Paul C. Samson, Oakland, Calif.: Bronchoscopy plays an invaluable role in the early diagnosis of primary carcinoma of the lung. Endoscopy constitutes the only proper means by which a biopsy specimen can be obtained prior to surgery. A positive biopsy can be obtained in from two thirds to three fourths of patients with carcinoma on whom bronchoscopy was done. A negative bronchoscopy does not rule out the possibility or even the probability that a carcinoma is present. A subacute inflammatory process may clear following bronchoscopy, but it is highly suggestive when the roentgen findings remain the same or increase, even if the patient's symptoms (particularly productive cough, fever or pain) are ameliorated. Under such circumstances it is poor judgment to wait until a tumor may become visible bronchoscopically. Exploratory thoracotomy within a period of two to four weeks is far preferable. In patients suspected of having bronchogenic carcinoma but in whom no tumor can be seen several maneuvers may be employed to aid in the diagnosis. Indirect evidence of a neoplastic process may be gained by observing fixation, stenosis or deformity of the bronchial walls. When upper lobar lesions are encountered, a right angle bronchoscopic telescope may visualize the neoplasm "around the corner." In rare instances it may be justifiable to induce a pneumothorax in an effort to deflect the upper lobar bronchus so that a full lumen image may be seen. In lower lobe disorders prebronchoscopic study of roentgenograms may localize the lesions sufficiently so that a "blind" biopsy may be done safely with the cup or ball bearing forceps, or by endoscopic curettage. When bloody sputum is obtainable Holinger collects this material and sections it. Your chairman has made additional refinements in his cytologic study of bronchoscopically removed secretions. Endoscopy is a valuable aid in the determination of operability. It is to be stressed, however, that the presence of early mediastinal metastases or infiltration cannot always be proved bronchoscopically. Carinal widening and fixation usually means extensive metastasis to the subcarinal lymph nodes. Induration or distortion of the lower tracheal wall is highly presumptive evidence that the neoplasm is no longer resectable. The bronchoscope is very effective in improving pulmonary drainage when chronic infection exists distal to an obstructing neoplasm. Immediate postoperative aspiration bronchoscopy is performed if there is the slightest question that all possible secretions have not been removed through the endotracheal catheter. To be of consultant caliber, a bronchologist must possess a knowledge of intrathoracic physiology and pathology as well as technical ability. The occasional remover of foreign bodies whose background is essentially nonthoracic cannot satisfy these requirements. Bronchoscopy and esophagoscopy are part and parcel of thoracic diagnosis, and there can be no question that the competent thoracic surgeon should perform his own endoscopies. This is scarcely less true of the medical specialist in chest disease. Both should acquire technical skill under suitable, auspices during their period of training. By the same token those whose training is primarily otorhinologic must ground themselves thoroughly in the various aspects of thoracic disease if they wish to become bronchologists and consultants in their professional communities.

Dr. Leo Rigler, Minneapolis: A mortality of 5 per cent in pneumonectomy is something for all of us to cheer about. During the course of survey examinations a good many lung tumors are now being picked up. In one county in Minnesota, where a mass survey study was made of a large portion of the population, among about 200 cases of tuberculosis 17 chest tumors were found. To find such small tumors of the lung, however, one has to look for small signs. One of these is the evidence of increased radiability of one lung as compared to the other, the result of obstructive emphysema. Westermark described this a number of years ago, but there is little or no reference to it in the literature as an early sign. Obviously it has to occur in cases in which the carcinoma is in one of the larger bronchi and causes a sufficient degree of partial obstruction at an early stage so that emphysema may be produced. I have recently seen 3 cases in which, if the original films had been critically examined, or if films had been made or fluoroscopy done in the phase of expiration, the clue to the fact that there was something seriously amiss in one lung would have been found. In each of these cases the root shadow was a little enlarged and one lung was more radiable than the other. Such a finding should lead to further studies by which a diagnosis of early carcinoma of the lung may be achieved. I was interested in Dr. Jones's statement about the substitution of planigraphy for bronchography. I have had a similar experience but find that in a good many instances I would prefer to do a bronchogram also before making an exploration, particularly, of course, when bronchoscopic biopsy is impossible. I should like to ask Dr. Jones whether he shares with other thoracic surgeons the reluctance to operate on a patient within a few days after the instillation of iodized oil. Some thoracic surgeons feel that bronchography may cause an operation to be postponed for six weeks, a very undesirable thing in carcinoma of the lung.

Dr. Maurice Lenz, New York: In support of the growth restraining effect of x-ray dosage with 200 kilovolts, I should like to cite an instance in which a patient who had a microscopically proved bronchogenic carcinoma of the left lower lobe has now been clinically well for six years. He has some fibrosis of the irradiated lobe of the lung but feels and looks perfectly well. On the other hand, I have dozens of similar patients who have died.

Dr. John C. Jones, Los Angeles: In answer to Dr. Rigler's question about the surgeon's reluctance to operate soon after bronchography with iodized oil, a patient who has a carcinoma of the lung should not have a resection delayed for several weeks while waiting to cough out the oil in the good lung. If bronchography is indicated at all, it should be limited to the affected side. A spill over into the good lung is to be avoided and the patient given postural drainage immediately after roentgenography to drain out his oil and secretions so as to prevent oil trapping and pneumonitis. The roentgenologists have been of great help to us in this problem of carcinoma of the lung. Since there has been a great reduction in the operative mortality in resection, roentgenologists have changed a great deal in their attitude toward the treatment of these patients. They now are far more confident of their diagnosis of the disease and refer these patients to the surgeon for bronchoscopy and resection with impunity. They seemed reluctant to do so when the mortality ranged above 50 per cent. We are seeing many cases now that the radiologist sheltered eight or ten years ago. The statistics presented here are absolutely useless from the standpoint of "cure," for all these patients were operated on during the last four years. None of these resections were done for the so-called "benign adenoma," the latter group not being included because in the eventual follow-up a much higher percentage of cures would be recorded than actually existed in the carcinomas alone. Including the adenomas would lead only to false optimism. In none of these resections was roentgen therapy given.

ROENTGEN THERAPY IN CANCER OF THE LARYNX

MAURICE LENZ, M.D.
New York

Roentgen therapy of cancer of the larynx depends on the administration of sufficient x-rays to destroy the cancer while preserving the recovery power of the simultaneously irradiated, uninvolved larynx and laryngopharynx. The resistance to x-rays of the cancer and of the uninvolved laryngeal and pharyngeal mucosa is so similar that in order to destroy the cancer it is necessary to administer a dose which will also cause sloughing of the irradiated mucosa. The resulting denuded area promptly epithelizes, provided the subjacent vascular and connective tissues are healthy and have not been injured by preceding disease, operative trauma or previous irradiation. Microscopic evidence of retrogressive radiation changes in the vascular and connective tissues begin to appear about two to three months after such x-ray dosage. It is therefore preferable to terminate all roentgen therapy before this period of lowered resistance and not to repeat the treatment.

Tolerance of radiation injury diminishes with increase in the size of the irradiated area. Small cancers are therefore more easily treated than extensive ones. The latter require exfoliation of larger areas of laryngeal and pharyngeal mucosa, causing more dysphagia and consequently greater likelihood of dehydration. Roentgen therapy of small fields is readily tolerated by ambulatory patients. Irradiation of extensive areas may require hospitalization so as to combat dehydration by gavage, hypodermoclysis, proctoclysis or venoclysis. These considerations argue for the use of the smallest radiation fields which will include the clinically involved area. An ample zone of grossly uninvolved tissue surrounding the cancer, however, should also be adequately irradiated in order not to exclude silent extensions, which later might give rise to local recurrence and metastasis.

Because of the position of the larynx near the entrance to the respiratory tract, sloughs of the mucosa resulting from the natural breakdown of the cancer or due to the x-ray reaction may be aspirated and may give rise to bronchopneumonia or lung abscess. Tolerance for intensive roentgen therapy is especially poor in weak patients suffering from chronic alcoholism, cardiovascular disease, diabetes and other debilitating diseases.

Adequate x-ray dosage to laryngeal cancer causes a little dilatation of the lymph capillary plexus of the laryngeal mucosa, especially in its richer supraglottic portion. Ordinarily this reaction is slight, passes unnoticed and recedes in a few days or weeks. This dilatation may, however, become more pronounced if the flow through the plexus is already obstructed by extensive invasion by cancer or if the daily or total x-ray dose has been excessive, especially if the radiation fields are larger than 8 by 10 cm. The x-ray reaction in such cases may cause acute edema of the larynx and necessitate emergency tracheotomy. The edema may then disappear or be followed by chronic edema, lasting months and even a year. The damaged mucosa has little resistance to infection. Weeks or months later it may again become suddenly and noticeably edematous, necessitating tracheotomy, or may break down. The ulceration permits entrance of bacteria into the deeper layers, which may be followed by perichondritis with consequent radionecrosis of the laryngeal cartilage. This complication occurs exceptionally unless the mucosa is extensively involved.

Cartilage which has a healthy perichondrium will usually tolerate an x-ray tumor dose which is considered adequate for destruction of laryngeal cancer. The same dosage may result in chondronecrosis if the tolerance of the cartilage has been lowered by preceding disease, partial resection or previous intensive roentgen or radium therapy, and above all if it is invaded by bacteria or cancer. Chondronecrosis is exceptional after roentgen therapy of small laryngeal cancers. In a review of 29 cases of chondronecrosis following roentgen therapy for cancer of the larynx at the Presbyterian Hospital, New York, during the past sixteen years, William A. Goodrich found a single instance of this complication in which the cancer was confined to its original site—in this case the lesion was on the epiglottis; nearly all others showed extensive involvement.

The gravity of chondronecrosis differs as to whether it occurs in the arytenoids, the epiglottis or the more rarely invaded thyroid cartilage. Involvement of the latter is usually limited to far advanced cases which are incurable by roentgen therapy.

Epitheliomas arising on the mucosa of the epiglottis readily invade this cartilage because of the close attachment of the mucosa to its perichondrium. Drainage from the suprahyoid portion and free border of the epiglottis is down toward its base. Necrotic cartilaginous sequestrums resulting either from destruction by cancer or radionecrosis fall into the laryngeal ventricle and are coughed up. Though roentgen therapy may temporarily increase this chondronecrosis, healing may nevertheless take place once the sequestrums have been disposed of. Most cured epitheliomas of the epiglottis show a deformity of the epiglottis suggesting healed chondronecrosis.

Similarly favorable conditions do not exist in chondronecrosis of the arytenoid cartilage, and adequate roentgen therapy may at times even aggravate the condition. Necrotic sequestrums of the arytenoid cartilage slough into the adjacent piriform sinus, where they remain in a sort of reservoir. Drainage from this is uphill, and the cavity cannot be emptied by coughing, although some material may spill over into the pharynx and be swallowed. As the necrosis progresses, it may reach a blood vessel and cause fatal hemorrhage. Absorption from this area may produce cachexia, and aspiration may be followed by pneumonia or lung abscess. The gravity of invasion of the

---

Read before the joint meeting of the Section on Laryngology, Otology and Rhinology and the Section on Radiology at the Ninety-Fifth Annual Session of the American Medical Association, San Francisco, July 5, 1946.

arytenoid cartilage in the treatment of cancer of the larynx by x-rays cannot be exaggerated and is amply supported by published survival statistics after roentgen therapy.[1]

Local extensiveness, metastatic involvement of lymph nodes,[2] and, to a lesser degree, microscopic evidence of differentiation, all have an influence on the radiocurability of laryngeal cancer.

The extent of involvement on admission to roentgen therapy is likely to differ according to the primary site within the larynx.

While hoarseness facilitates early recognition and treatment of cancer at the edge of the vocal cord, cancers of the bands, subglottis, epiglottis, aryepiglottic folds and piriform sinus are frequently overlooked until necrosis and hemoptysis, dyspnea due to an obstructing bulky growth, or a metastatic lymph node calls attention to the correct diagnosis.

The paucity of lymphatics at the edge of the vocal cord contrasted with the rich lymph capillary plexus of the rest of the larynx also contributes to the fact that local extension and metastasis of cordal cancer is slower and later than in growths of other portions of the larynx. Spread at first is by contiguity and along the delicate horizontally placed lymph channels the length of the cord, more commonly forward and across the anterior commissure. More rapid and wider extension and lymph node metastasis occurs only after the cancer has reached the richer lymphatic plexus of the walls of the larynx or posterior commissure. As is well known, the supraglottic and infraglottic lymphatic plexuses draining the interior of the larynx communicate only on the posterior wall of the larynx. The supraglottic collecting trunks unite in the form of lymphatic pedicles near the junction of the lateral border of the epiglottis and the aryepiglottic fold. They dip under the mucosa of the piriform sinus, where they unite with the lymphatic trunks of the inferior part of the pharynx. Together they traverse the thyrohyoid membrane through the orifice for the superior laryngeal artery and empty into the anterior group of the deep cervical lymph nodes on the jugular vein. Cancer cells of epitheliomas arising in the ventricular bands, ventricle, epiglottis or aryepiglottic folds growing along and into these lymphatic channels may be carried in the direction of the lymphatic flow, starting new extensions and lymph node metastases. Retrograde spread does not occur until progress forward is blocked by obstructing cancer.

TABLE 1.—*Results of Treatment*

128 Patients Treated 1931-1941, Reviewed May 1946

3 patients discarded; received about half adequate x-ray dose
15 patients discarded; lost or died of intercurrent disease, free from cancer

110 Patients Studied in Detail

Cause of Death	No. of Deaths
Cancer, persisting	42
Cancer, persisting or radiation edema	21
Larynx controlled; died metastases (lymph nodes 7, lungs 3, gum 1)	11
Radionecrosis	4
Alive with cancer	2
Cured	
a. Dead intercurrent disease, free from cancer over 5 yrs	7
b. Alive and well	23
c. Free from clinical evidence of cancer 5-14 yrs	30

The statements made in the preceding paragraphs were corroborated by a review of the clinical histories of the patients receiving roentgen therapy for cancer of the larynx at the Presbyterian Hospital, New York, between 1931 and 1941, as may be seen in the accompanying tables.

Of the 15 patients who died of intercurrent disease free from cancer, 3 were clinically free from cancer for four years, 2 for three years and 10 others for shorter periods after their last x-ray treatment. In the present study a follow-up of at least five years has been postulated as a prerequisite. It is for this reason that these 15 perhaps cured patients are not included in the present report.

Of the 110 patients used in this study, cancer was assumed to persist locally in the larynx or pharynx in 42. In 1, in whom the epithelioma had arisen in the ventricular band, epithelioma was again found in the piriform sinus seven years later. Since it was not possible to determine whether this was an extension from the original site or was an independent epithelioma, it was counted as a failure of roentgen therapy. In 21 other patients the larynx at the time of death was definitely edematous. Postmortem examination was not permitted, and it is uncertain whether the edema was the result of underlying unrecognized persisting cancer or radiation edema. In 4 patients who died, and in 1 who is now free from cancer, there was frank radionecrosis without evidence of persisting cancer. The living patient, a doctor now free from clinical evidence of cancer for six years since his last x-ray treatment, developed necrosis of the entire thyroid cartilage nine months after treatment, complicated by aspiration pneumonia, lung abscess and empyema necessitating resection of a rib for drainage. A year later, however, he was back practicing medicine. He had an epithelioma of the right cord which had extended across the anterior commissure to involve the left band, and he had refused a laryngectomy. In 11 other patients the growth was controlled in the larynx but in 7 spread to the regional lymph nodes, metastasizing in 3 to the lungs and in 1 extending to the gum.

Seven patients died from intercurrent disease, free from primary or metastatic laryngeal cancer more than five years after their last treatment. Among these, 2 died of cardiovascular disease, 2 of pneumonia, 1 of pulmonary tuberculosis, 1 of an independent bronchial cancer nine years after treatment and 1 of an unknown cause. Twenty-three patients are now alive and free from clinical evidence of cancer from five to fourteen years after their last treatment. In other words, 30 of 110, or 27 per cent of the patients with cancer of the larynx, are known to have remained well five years or more after roentgen therapy.

MICROSCOPIC GRADING

The prognostic significance of microscopic grading in roentgen therapy of cancer of the larynx has repeatedly been questioned.[3] Among 101 cases in our series classified microscopically, the five year cure rate was 27.2 per cent of 22 well differentiated epitheliomas, 26 per cent of 46 moderately differentiated and 36.9 per cent of 33 undifferentiated growths. It would thus appear that roentgen therapy is somewhat more successful in undifferentiated than in well differentiated or moderately differentiated epitheliomas. The influence of this finding on prognosis, however, is much less than the bearing of other factors such as involvement of the arytenoid cartilage or the presence of regional lymph node metastases.

TABLE 2—*Factors Influencing Prognosis*

	Number Treated	Free from Cancer 5-14 Years
Invasion of arytenoid		
Incomplete or no fixation	42	50%
Complete fixation	68	12.3% (epiglottis 27.7%)
Clinically metastatic lymph nodes		
Patients without nodes	57	37%
Patients with nodes	53	15% (epiglottis 28%)
Microscopic structure		
Well differentiated	22	27.2%
Moderately differentiated	46	26%
Undifferentiated	33	36.9%

The grave significance of invasion of the arytenoid cartilage and lymph nodes is illustrated by table 2.

The extent of the cancer with which the patient presented himself for roentgen therapy and the presence or absence of the unfavorable factors influencing prognosis differed according to the locations of the epithelioma on the laryngeal mucosa.

In reviewing the results just quoted, one is struck by the increasing number of failures with increased extent of the cancer on admission. Roentgen therapy succeeded in arresting 8 of the 10 cases in the first two groups, or 80 per cent. The first 6 cured cases, confined to one cord, and the next 2 involving the anterior commissure, could probably also have been treated successfully by laryngofissure and cordectomy. The 2 failures could not have been avoided by this operation. One patient died of regional lymph node metastases though free of laryngeal disease, while in the other the epithelioma arose in the posterior third of the vocal cord, which is considered to be a contraindication to laryngofissure. The 5 other cases arrested by roentgen therapy were too extensive for laryngofissure and would have required laryngectomy.

One is therefore confronted with the fact that, as far as curability is concerned, roentgen therapy of early cordal cancer in which the entire larynx is irradiated compares favorably with the more limited approach by laryngofissure and cordectomy. Though many[4] disagree with this view, roentgen therapy may even be superior to this operation, especially if the cancer has extended beyond the cord and anterior commissure. Roentgen therapy results in a much better voice than laryngofissure, a fact which will be admitted by any impartial observer who has had the opportunity to watch the result of both methods over a period of years. This is the view held by Dr. J. D. Kernan, the director of the laryngologic service at the Presbyterian Hospital, with whom my associates and I have had a joint follow-up clinic for the past fifteen years.

Subglottic extensions from epithelioma on the superior surface of the cord, as well as primary epitheliomas arising in the subglottic space, are frequently overlooked until they are extensive, because of the absence of early symptoms. In addition to mirror and direct laryngoscopy, lateral roentgenograms of the neck and tomographs should be taken so as to help estimate more correctly the extent of the disease. The epithelioma fixes the cord, causing hoarseness, and when extensive may cause a peculiar dyspnea. The relative infrequency of this involvement makes it difficult to evaluate roentgen therapy in epitheliomas of this location. In addition to the 2 failures just quoted, we failed in 2 primary epitheliomas in the subglottic region. Because of these frequent failures we lean toward laryngectomy. A preliminary trial with irradiation may at times be justified if there are valid objections to laryngectomy.

When cancer of the vocal cord has produced a partial fixation of the arytenoid cartilage, a full course of x-ray therapy should be given. The frequency with which these cases respond satisfactorily warrants that a decision to do a laryngectomy be deferred for three months or so to see whether the treatment may not eradicate the disease. In spite of improved speaking apparatus and schools for the teaching of esophageal voice, the laryngectomized patient is seriously handicapped and usually cannot continue in his former occupation. A full course of modern roentgen therapy before laryngectomy has, in our experience, not interfered or delayed healing materially.

In view of the poor results with roentgen therapy in patients with invasion and complete fixation of the arytenoid cartilages, laryngectomy must remain the first choice when this extension has taken place. Four of the 21 patients with this complication in this series, however, were clinically arrested over five years by roentgen therapy alone. A preliminary trial with roentgen therapy may therefore be justified occasionally and laryngectomy deferred for three months. Roentgen therapy in these cases, however, is less reliable than laryngectomy.

The usefulness of so-called prophylactic postoperative roentgen therapy is questionable. We do not use it but give postoperative irradiation only if after laryngectomy there is persisting cancer clinically or if microscopic examination of the laryngectomy specimen shows that the cancer has been incompletely removed.

TABLE 3.—*Epithelioma of Vocal Cord*

(17 of 40 patients free from clinical evidence of cancer 5-14 years)

Extent on Admission	Number Treated	Number Free from Cancer	
Limited to one cord	7 (1 posterior ⅓)	6	80%
Extension, anterior commissure	3	2	
Extension, opposite band or cord ...	*3*	*2*	55.5%
Subglottic extension	3	1	
Arytenoid partly movable ...	3	2	
Arytenoid fixed	21 (9 ln)*	4	19%

* ln = clinically metastatic lymph nodes

Neither do we believe in prophylactic lymph node excision in cordal cancer. We advise radical neck dissection in the presence of movable clinically involved lymph nodes if they are single or few in number. If widespread, nothing seems to do much good, but palliative roentgen therapy may be tried. This treatment may also be used if these nodes are fixed. If fixed and single, or few in number, higher doses of roentgen therapy over small individual fields, or interstitial radium or radon, with or without preliminary surgical exposure, may be used.

---

[4] Martin, H. E.: Selection of Treatment for Cancer of the Larynx, Ann. Otol., Rhin. & Laryng. 49: 728, 1940.

Of the 7 epitheliomas of the ventricular band, 5 extended to the arytenoids and lymph nodes, 1 to the piriform sinus, 2 to the laryngeal surface of the epiglottis and 1 to the preepiglottic space. In only 1 instance was there also downward extension toward the vocal cord, but there were none to the infraglottic region. In spite of the extension to the arytenoids and lymph nodes, 2 of the patients were clinically cured.

Of the 9 patients classed as clinically cured, only 6 are alive and well five to fourteen years. Three died free from cancer, 1 five years after treatment of pulmonary tuberculosis, the second in 6 years of pneumonia and the third in six years with coronary artery disease. Because of the rich lymphatic drainage of the epiglottis, lymph node metastases are frequent (21 of 28). The anterior surface of the base of the epiglottis is perforated by the ducts of numerous mixed mucous glands. These perforations facilitate extension of cancer from the laryngeal to the lingual side and vice versa. Ten of the 28 epitheliomas of the epiglottis arose on the laryngeal surface, 6 on the lateral border and 12 originated nearer the lingual surface In more than half of those on the laryngeal surface there was extension to the aryepiglottic fold and arytenoid, and in half of those arising on the lingual side there was involvement of the base of the tongue. There were also extensions to the piriform sinus, cord, band, vallecula, lateral pharyngeal wall and supratonsillar region. In none of the 28 was the cancer limited to the epiglottis when the patient arrived for roentgen therapy.

TABLE 4.—*Epithelioma of Ventricular Band and Ventricle*

(3 of 8 patients free from clinical evidence of cancer 5 14 years)

Extent on Admission	Number Treated	Number Free from Cancer
Ventricle	1	0
Band and cord	2	1
Band and arytenoid	5 (5 ln)	2 (2 ln)

TABLE 5.—*Epithelioma of the Epiglottis*

(9 of 28 patients free from clinical evidence of cancer 5 14 years)

On Admission Extension to	Number Treated	Number Free from Cancer
Aryepiglottic fold	11	3
Arytenoid	11 (8 laryngeal)	3
Piriform sinus	2	1
Lateral pharynx	2	0
Tongue	12 (6 lingual)	1
Tonsillar fossa	2	1
Lymph nodes	21	8 (38%)

Invasion of the arytenoids and clinically metastatic lymph nodes is evidently not so serious in cancers of the epiglottis as in those of the vocal cords.[5] This cannot be explained on the basis of lesser differentiation of the cancers. Of the 3 cured cases with invasion of the arytenoid, 1 was well differentiated and 2 moderately differentiated. Of the 8 arrested cases with lymph node metastases, 1 was well differentiated, 2 moderately differentiated and 4 undifferentiated.

EPITHELIOMA OF ARYEPIGLOTTIC FOLD

Radiocurability of epitheliomas of the aryepiglottic fold varies with their proximity to the arytenoids—the nearer the growth is to the arytenoid, the worse is the outlook for a cure. One of the 4 patients with an epithelioma close to the epiglottis is well nine years after treatment, while the other 3 are dead. Both of the 2 patients whose epithelioma originated nearer the arytenoid are dead.

EPITHELIOMA OF PIRIFORM SINUS

All of the 26 epitheliomas arising in the piriform sinus invaded the arytenoid and 17 clinically also involved the cervical lymph nodes. The 26 patients are dead. Statistics of other radiotherapy clinics corroborate the failure of roentgen therapy in epitheliomas of this location. Better results might perhaps be obtained if laryngectomy could be done before the lymph nodes are invaded If the removal is incomplete, as proved by gross persistence or microscopic examination of the laryngectomy specimen, postoperative roentgen therapy may be indicated. With the laryngeal cartilage entirely out of the way, fear of chondronecrosis will not interfere with the administration of adequate tumor dosage.

TECHNIC

The technic of modern roentgen therapy of cancer of the larynx dates back to 1919, when Coutard[6] first published his method of treatment and results. In spite of some technical improvements, the main principles of the treatment laid down by Coutard at that time still hold true today. The published five year statistics of results obtained by various technics[7] do not appear superior to those accomplished by Coutard twenty-seven years ago, and often it is more a matter of personal preference which one is employed. An accurate estimate of the extent of the disease, familiarity with laryngoscopy for guidance of the daily dosage and careful setting up of the field by the person doing the laryngoscopy contribute to the success of the treatment. The treatment should never be entrusted to a technician without medical supervision. If a patient is once irradiated unsuccessfully, it is unlikely that cure can be obtained by subsequent roentgen therapy.

Because of the low output of Coutard's original x-ray equipment, each exposure took several hours, the treatment being administered twice daily. In 1928 more powerful x-ray equipment delivering 30 milliamperes and 200 kilovolts was installed at Montefiore Hospital in New York, and we had the opportunity to administer the same doses as Coutard in daily treatments lasting fifteen to twenty minutes. The early results of this technic and some of the first cases treated at the Presbyterian Hospital were presented before the Section on Radiology at the Eighty-Third Annual Session of the American Medical Association in New Orleans on May 11, 1932.[8] Since that time we have modified our technic by reducing the size of the irradiated area and the daily dose so as to conserve normal tissue resistance.

Our present technic consists in the administration of an average tumor dose of 5,700 to 7,000 roentgens in five to six weeks. Treatment is given once daily, except Sundays, and 100 roentgens in air, 20 roentgens per minute, with 200 kilovolts, 2 mm. of copper or Thoreus filter, 50 cm. target-skin distance is administered to each side of the neck over the larynx up to a total of 3,000 to 3,500 roentgens in air on each side. Treatment is discontinued for a few days if severe mucositis develops during the course of the treatment, and irradiation is begun again when this reaction starts to recede. Most of the clinically arrested cases show some sloughing of the irradiated mucosa toward the end of their treatment. While the sizes of the fields used originally often exceeded 8 by 10 cm., the acute immediate pharyngitis and the chronic pharyngitis which followed have led us to reduce our fields to at most 8 by 10 cm. and usually to 6 by 8 cm. or smaller. In cordal cancer we prefer a field of 6 by 6 cm. and at times have used a field of 4 by 5 cm. In extrinsic epithelioma 6 by 8 cm. is the average, but we usually start with an 8 by 10 cm. field, gradually reducing it. When nodes are involved, these small fields do not suffice, and additional special fields directly over the nodes have been used. The results of roentgen therapy in lymph node metastases secondary to cordal cancer have been poor, and we prefer radical neck dissection if the nodes are movable and few in number; if fixed we advise interstitial radium for limited involvement and x-ray therapy if many nodes are invaded. Lymph node metastases from cancer of the epiglottis or band have often responded satisfactorily to roentgen therapy.

[8] Lenz, Maurice: Roentgentherapy of Malignant Neoplasms of the Pharynx and Larynx, J. A M. A **99:** 1840, 1932

An analysis of 110 clinical histories of patients who received roentgen therapy for cancer of the larynx at the Presbyterian Hospital between 1931 and 1941 and were reviewed in May 1946 with the finding that 30 were free from clinical evidence of cancer between five and fourteen years has led to the following conclusion:

CONCLUSION

Roentgen therapy in early cancer of the cords gives as high a cure rate and a better voice than laryngofissure. We recommend roentgen therapy in all cancers of the vocal cord except when the cancer has extended subglottically or into the arytenoid cartilage. In these cases we prefer laryngectomy followed by roentgen therapy if clinically there is persisting cancer or if microscopic examination of the laryngectomy specimen shows that the removal was incomplete. Roentgen therapy in cordal cancer with definite fixation of the arytenoid cartilage has succeeded in a small number of cases but should be substituted for laryngectomy only if there are valid reasons for avoiding this operation. If the arytenoid is partially movable a trial with roentgen therapy is indicated. If roentgen therapy fails, laryngectomy can be done without fear of delayed healing, provided treatment has been properly administered. For cancers of the epiglottis, ventricular band and anterior portion of the aryepiglottic folds roentgen therapy should be employed even after fixation of the arytenoids and the occurrence of lymph node metastases.

Cancer of the piriform sinus usually invades the arytenoid cartilage and early metastasizes to the cervical lymph nodes. Roentgen therapy has failed to cure most of these cancers.[9] Laryngectomy and postoperative roentgen therapy might yield better results.

Prognosis is grave when cancer of the cord or piriform sinus has metastasized to lymph nodes. If movable they should be radically resected and, if fixed, treated by radium or x-rays. Prognosis is less serious if these metastases are secondary to cancer of the epiglottis or band. These should receive roentgen therapy.

SURGICAL TREATMENT FOR CARCINOMA OF THE LARYNX

SIMON JESBERG, M.D.
Los Angeles

The treatment for laryngeal cancer is surgical, radiologic or a combination of the two. The selection of the course of treatment is governed by broad basic principles that time and experience have shown to be efficacious. The selection must be under the direction of one who is a laryngologist and is radiologically minded or a radiologist who is trained in laryngology.

There is only one Coutard in this world, who is a radiologist and a laryngologist combined. Therefore a close and sympathetic understanding between the laryngologist and the radiologist will give the laryngeal cancer patient the full benefit of all treatment possible. One who is partisan minded is in no position to select or direct the treatment for cancer of the larynx.

Malignant growths follow the pattern of the parent cell. Thus in cancer of the larynx there exist two separate and distinct conditions, because the one that arises from the vocal cord is almost invariably squamous cell carcinoma of low grade malignancy, which is not radiosensitive and which belongs to the domain of surgery, whereas elsewhere in the larynx the exact opposite holds forth. That is, tumors of high grade malignancy are more amenable to irradiation than to surgery.

In addition to this, tumors that arise on the vocal cords are of slow growth and are of the adult type cell, and the bed from which they spring is poorly supplied with lymphatics and blood vessels, so that they can be expected to be localized for a long time.

Cancers that arise elsewhere in the larynx spring from a bed that is abundantly supplied with lymphatics and blood vessels. Their growth is rapid and they extend early to regional nodes or metastasize. Quite likely by the time diagnosis is made those tumors have already extended beyond the area of surgical possibility.

No cancer can be diagnosed without a biopsy. Direct laryngoscopy in this field with the Jackson biopsy forceps is used for the purpose of securing the tissue for examination.

There are two main classifications of carcinoma of the larynx. In common laryngeal parlance the description of intrinsic and extrinsic cancers is not sufficiently distinctive. Textbooks on anatomy divide the larynx into three components and do not even mention intrinsic and extrinsic, and such a description is the outgrowth of the laryngologist who recognizes the clinical significance of laryngeal cancer according to its site of origin whether cordal or extracordal.

The first is almost invariably of low grade malignancy and belongs to the domain of surgery. The extracordal cancers arising from columnar epithelium are almost invariably highly malignant and more radiosensitive. This distinction is of the greatest importance when malignant neoplasms in this field are considered. Squamous cell epithelium gives rise to epidermoid cancer, generally with a high percentage of keratin. As is well known, these cancers are of adult type cell and are of low grade malignancy. According to Coutard,[1] "the more the embryonal or undifferentiated cells, the more the possibility of curing by irradiation. Cancers consisting of differentiated cells developing on fibroelastic connective tissue are forms generally incurable or difficult to cure by irradiation, because of the lack of radiosensitivity. When they are technically operable they belong to the domain of surgery, because the cells multiply slowly and have only a slight tendency to disseminate and develop adenopathy rarely or late."

[9] Schinz, H. R., and Nuppinger, A.: Seventeen Years of Radiotherapy of Cancers, Leipzig, Germany, Georg Thieme.

Read before the joint meeting of the Section on Laryngology, Otology and Rhinology and the Section on Radiology at the Ninety-Fifth Annual Session of the American Medical Association, San Francisco, July 5, 1946.

There are two other sites in the larynx that require special mention. The epiglottis is definitely a part of the larynx, and a cancer originating from this appendage may almost entirely involve the whole structure and yet be slow to extend to surrounding tissues. Of 5 cases of cancer of the epiglottis, 4 were cured by external subhyoid pharyngotomy.

The other area in which cancer arises is subglottic. These tumors, according to Coutard and Clerf, are not usually radiosensitive. Clerf states that they generally should be treated by laryngectomy; however, if one can remove the entire growth it can be treated by laryngofissure. I have several patients who are alive and well over ten years following the operation.

The indication for laryngofissure is when the cord is motile and the lesion is located in the anterior part of the cord. If the cord is motile or whether it is fixed is of the utmost importance, because in the latter situation the underlying structures are infiltrated, and the thyroid cartilage must be removed along with the involved cord. When, on clinical examination of the larynx, the tumor is found to involve or nearly involve the anterior commissure I consider that it has already crossed to the opposite side and I remove the anterior part of the other cord. More extensive lesions than this of cordal origin call for a laryngectomy.

I am in entire accord with Hayes Martin,[2] who approached the laryngologic problem from the radiologic side. Some years ago he took over the treatment of a very prominent citizen who had carcinoma of the larynx arising from the aryepiglottic fold. Much to my surprise, the first thing Martin did was a laryngectomy, and the patient is alive and well. In personal communications which I have had with Dr. Martin, he has expressed himself by saying that small cordal cancers are best treated by partial laryngofissure. He favors total laryngectomy in more extensive intrinsic cancer and in general feels that there is insufficient appreciation of the possibility of combining radiation and surgery in certain cases.

CONCLUSIONS

1. Surgical treatment for carcinoma of the larynx consists in laryngofissure with cordectomy if the cord is motile and laryngofissure with removal of underlying laryngeal cartilage if the cord is fixed.
2. Cordal cancer approaching the anterior commissure should be treated by removal of the anterior part of the opposite cord with laryngofissure.
3. Cordal cancer that has involved the larynx beyond the extent of the true cord calls for a laryngectomy.
4. If the cancer is extensive or of high grade malignancy a preliminary course of irradiation should be done before surgery is attempted.

500 South Lucas Avenue, Los Angeles 13.

ABSTRACT OF DISCUSSION

ON PAPERS OF DR. LENZ AND DR. JESBERG

Dr. Orville N. Meland, Los Angeles: I have been familiar with Dr. Jesberg's work for many years, and I feel that he has always approached the subject of carcinoma of the larynx with an open mind. Careful selection of cases is the basis of selection of treatment. The laryngologist usually sees these patients first, and on him rests the responsibility of deciding the best method of approach. In early lesions, usually of low grade, limited to the anterior cord which is still mobile, the results from laryngofissure have stood the test of time. However, I have treated many of these persons who have refused surgery and many have gone anywhere from five to thirteen years; but I have also had many failures. I have not been able to approach the results Dr. Lenz has. I have about 50 per cent living and well. I feel that laryngofissure is still the method of choice for these early localized areas. When the disease is no longer confined to the cord, and especially when it extends posteriorly to the vocal process and up toward the arytenoids, with fixation, the problem is different. The disease is usually more malignant and tends to metastasize earlier. Here the decision is between laryngectomy and irradiation. These patients should be given the test of radiation therapy, and after the treatment if there is any residual growth, or if there is a persisting edema that doesn't subside, the patient should have another biopsy. When positive, laryngectomy should be carried out, since further irradiation is of no value as far as cure is concerned. If surgery is undertaken it should not be delayed too long, so as to avoid the technical difficulties of increasing fibrosis. Patients who have postoperative recurrence, or those who develop metastases, do not do well with external irradiation alone. While it is true that an occasional case does respond, in the main the results are disappointing. These should be treated by some method of electrosurgery accompanied with a partial or radical neck dissection, occasionally supplemented by the use of radon seeds or platinum radium needles.

Dr. Julius A. Weber, Seattle: Dr. Lenz quoted 7 cases of cordal carcinoma treated between 1931 and 1941, of which 6 were cured, or 80 per cent. Between 1932 and 1941 I treated 9 cases of purely cordal carcinoma by fissure operation. One death occurred on the ninth day of embolus; the remaining 8 were cured, ranging from five and a half to twelve years, or 88.8 per cent. Dr. Jesberg mentioned that the severity of the disease should be classified according to grade only. Of my 9 cases 5 were of grade 1, 2 were of grade 2 and 3 were of grade 3. The location of the lesion, rather than the gradation, is the most important factor. I believe Coutard and others have the same opinion. For cases of carcinoma of the epiglottis, arytenoid or aryepiglottic fold I use radiation first in most cases. If that fails I consider surgery. In cases in which the lesion extends to the anterior commissure it is my custom to use an operation similar to that of Jackson and Clerf, in which I incise the cartilage beyond the midline to remove the anterior commissure, including its cartilage, plus the primarily involved side. This is a very fine operation, offering good results. It is important that if a radiologist sees these cases first he should work with a very competent laryngologist who is able to see the exact site of these lesions in order to get the best interpretation of results.

Dr. T. E. Carmody, Denver: I have had the pleasure of seeing Dr. Lenz's and Dr. Curran's work and I have known of Dr. Jesberg's work for a good many years and have seen many cases of his. Some of these carcinomas are radioresistant.

---

[1] Coutard, Henri: Results and Methods of Treatment of Cancer by Radiation, Ann. Surg. 106: 584 (Oct.) 1937.

[2] Martin, Hayes: Personal communication to the author.

In such cases surgery is necessary. That may not be found as much in the larynx as in other parts of the upper respiratory tract, which I have seen, some of them treated with radium or x-rays that did not respond, while surgery cleared them up. I was interested in Dr. Lenz's statement regarding aspiration from the epiglottis and from the arytenoid. In some upper respiratory tract cases something will be aspirated into the larynx. I had such a case years ago, a carcinoma of the tongue, in which a portion apparently was aspirated, and there was a carcinoma of the bronchus. If we treat these cases with heavy doses of x-rays or radium, operation afterward will sometimes cause a lot of trouble. I had a case some years ago in which x-ray treatment was given and later I did a laryngofissure and all the cartilages of the larynx necrosed away. I was blamed for that, and probably rightly. If carcinomas are radioresistant operation is to be performed. If they are not radioresistant the x-rays will be of help. I have had some inoperable carcinomas treated with x-rays with excellent results, and some of the patients will do very nicely, and some of them are alive several years later. Wherever the lesion is (and the lesions in the posterior part of the larynx are always worse), whether we take the cellular theory or whether we depend on the location is something that we should keep in mind in treating these patients.

Dr. Irving Wilson Voorhees, New York: The fairness of approach with which all of you are working on cancer of the larynx is one of the most pleasing things in connection with my visit to San Francisco. Nobody is riding his hobby too hard. Everybody is working to try to solve an apparently insoluble problem. The fact that a patient lives five or seven years without recurrence in the larynx is pleasing. However, when surgery is undertaken for the cure of cancer, wherever it is, the cancer is always a couple of jumps ahead of the knife. Are we dealing with a local condition with constitutional symptoms or are we dealing with a constitutional disease with local signs and symptoms? Time after time we see a carcinoma of the cervix cured apparently, and then amputation of the breast cured apparently, only to break out in the lymphoid nodes in the abdomen or elsewhere. That is a discouraging fact. I regret to have to sound it, but I think we may hope that eventually cancer will be cured (if we may use the word "cured") or at least alleviated more than for five to seven years via the blood stream by some method yet undiscovered—perhaps by chemotherapy or an antibiotic. That is the way the problem will eventually be solved.

Dr. L. H. Clerf, Philadelphia: I agree with the authors, both of whom presented the subject fairly. It is important that the radiologist and the laryngologist cooperate. I would place as little dependence on the statements of a laryngologist concerning radiologic matters as on the radiologist's opinion in laryngologic problems. This applies particularly to their statistics. In the treatment of cancer, whoever begins therapy in a given patient has the best chance to make that patient well. Obviously, patients cannot determine what is the best plan. Some patients are more interested in a good voice and lose sight of the need of saving life. It is the patient's life we want to save and not his voice. Selection of cases influences statistics. Those of you who knew the late Dr. Mackenty know that he had a magnificent record with cancer of the larynx. After doing a few laryngofissures he performed only laryngectomies. He selected only early cases and as a result had few recurrences. He had no concern in late cases. Cancer is a strange disease and this too influences statistics. Patients with slowly growing lesions may survive a long time in spite of our prognosis. In 1928 Dr. Mackenty recommended laryngectomy on a patient. The patient refused and in 1939 I did a laryngectomy on that same patient. The old gentleman is alive and free from recurrence seven years postoperatively. I would not recommend that in every case. The matter of recurrences is important in statistical studies. Our results are best if cases are reported as soon as treatment is completed. The American College of Surgeons says we ought to wait five years. There is no limit for recurrences. One must live a number of years with cancer before one knows much about it. In the last six weeks I have taken out two larynxes of patients on whom I did laryngofissures, one seven years ago and the other seven and a half years ago. They are not new growths but are slowly growing recurrences in cases of incompletely removed cancers. Reference was made to the anterior commissure operation I advocated long ago. I have lived long enough now to know that there are too many recurrences in this group. If one is going to do surgery, one should do it radically enough so that no cancer will remain. If irradiation is selected, have a laryngologist help the radiologist to keep a watchful eye on the larynx so that if anything does happen there may be a reasonable chance to get rid of the growth.

Dr. Paul Holinger, Chicago: These papers have stressed again the fact that we are not dealing with surgery versus irradiation but with treatment versus the carcinoma. We have had presented here in Dr. Lenz's classification and analysis of cases and in Dr. Jesberg's analysis of results from the surgical point of view the possibility that we have to reevaluate some of our indications either for surgery or for irradiation. I have not been able to reproduce or duplicate the results that Dr. Lenz has shown. I extend my congratulations because we all know of his work and that of Dr. Kernan in the examination and follow-up of these patients. But why is it that we are unable to reproduce these results of irradiation? Is it a question of technic, a question of our evaluation and observation of the patients from the standpoint of indications, or is it a question of irradiation dosage? The dosage Dr. Lenz has mentioned is much smaller than I have been using in the same types of cases, and yet my results following irradiation are not in any way comparable to his. Results surgically, on the other hand, as Dr. Jesberg has indicated, in the operable lesions, have been unqualifiedly better than results following irradiation in similar cases. I am anxious to know, Dr. Lenz, more detail regarding technic, dosage, filtration, the interval between treatments, the indications for postponing treatment a few days and the like. You say that with mucitis you hesitate for a time to go ahead with treatment.

Dr. Maurice Lenz, New York: The belief that in early cancer of the vocal cords the proportion of five year freedom from clinical evidence of cancer after roentgen therapy is as great as, while the resulting voice is better than after laryngofissure, is based on a fifteen year follow-up carried on jointly with the ear, nose and throat service of the Presbyterian Hospital of New York. The director of that service, Dr. J. D. Kernan, concurs in this opinion. I agree with Dr. Clerf that the choice of laryngofissure or roentgen therapy for early cordal cancer should be based on the rate of cure. Since there is practically no difference between the results of the two methods of treatment in this type of cancer, the better voice following roentgen therapy makes its use preferable to laryngofissure. Modern roentgen therapy does not injure the larynx if the laryngeal cancer is small, the irradiated area limited and the irradiation not too intensive. The few very early cordal cancers in our series, which after roentgen therapy showed slight telangiectasia and slight thinning of the skin or laryngeal mucosa, were treated too intensively more than ten years ago; no such limited cases treated since then have shown x-ray injuries like those mentioned by Dr. Jesberg. Healing after laryngectomy for irradiated cancers of the larynx is not delayed if the irradiation is not too intensive. Thus Dr. Imperatori told me that there was no delay in healing after laryngectomy in a patient with laryngeal cancer which I had failed to arrest with roentgen therapy; the patient has now been well for over six years. I have seen delayed healing of the skin flap after laryngectomy when, in addition to the first series of x-ray treatments, the flaps had been exposed to a second series or to radium treatment. It is only these cases which justify Dr. Carmody's fears of delayed healing. Dr. Meland's suggestion to defer laryngectomy until after a trial with roentgen therapy and biopsy proof of persisting cancer in cordal cancers with arytenoid invasion deserves consideration. Dr. Holinger's request for details of treatment is complied with in the paper. I agree with Dr. Voorhees that neither surgery nor irradiation is the ideal treatment for laryngeal cancer.

Dr. Simon Jesberg, Los Angeles: Dr. Lenz has given the radiologic aspect of the treatment of carcinoma of the larynx and I have tried to present the surgical side. It is not possible of proof to show superiority of one treatment over the other; each has its indications, and when one fails the other may succeed. The person who treats carcinoma of the larynx should use any and all treatment best indicated in each individual case. There is not sufficient appreciation of the benefits to be obtained by combining both surgery and irradiation. Allegorically I like to think of the one treating carcinoma of the larynx as the skipper of an auxiliary yacht. He has both wind and motor power and will use either or both to meet existing conditions and to accomplish the purpose of his voyage. If he wishes to reach his destination in the shortest time he will use both sail and motor; if there is no wind he must rely on his motor; if his motor is out of commission and there is no wind, he is left at the mercy of the elements; if he is in a sailing race his motor is sealed and he must rely on wind alone. Such an event comes under the heading of sport, and the treatment of carcinoma is no sport.

IRRADIATION OF HYPERPLASTIC LYMPHOID TISSUE IN THE NASOPHARYNX

SAMUEL J. CROWE, M.D.
and
EDWARD M. WALZL, M.D.
Baltimore

The presence of hypertrophied or chronically infected lymphoid tissue in the nasopharynx has long been recognized as the cause of many ills related to the upper air passages, such as repeated colds, sinusitis, ear infections and deafness.

Since the adenoids form an integral part of the mucous membrane of the nasopharynx, it is usually impossible to remove them completely by surgical operation, and nodules which are left often rapidly hypertrophy, so that within a few months there is recurrence of the original condition. In cases of deafness resulting from obstruction of the eustachian tubes, surgical removal of the adenoids is often unsuccessful in relieving the condition, because often the offending lymphoid tissue is within or close to the orifice of the eustachian tubes and thus is inaccessible for surgical removal. Such tissue, when chronically infected, will cause edema of the surrounding mucous membrane and thus impair the drainage and ventilation of the middle ear. The complete removal of this tissue is essential if deafness is to be prevented.

Fortunately lymphoid tissue is extremely sensitive to irradiation with radium or x-rays. For the past eighteen years Dr. Samuel Crowe and his associates have been using irradiation for the removal of such surgically inaccessible lymphoid tissue in the nasopharynx. With doses too small to cause demonstrable effect on the mucous membrane, cartilage or glands, the lymphoid tissue may be caused to disappear, leaving behind smooth, normal appearing mucous membrane.

During these years many thousands of treatments have been given, and there have been no burns or other serious reactions.

Microscopic examinations of adenoids which had been irradiated before removal shows that the action of the radiation is confined to the cells of the germinal centers. A few days after irradiation these cells show chromatolysis and fragmentation of the nuclei. Since the life span of the mature lymphocytes is only a few weeks, the mass of the adenoid tissue gradually shrinks, since there is no replacement from the damaged germinal centers.

Radium has been used as a source of radiation instead of x-rays because the applicator can be placed in contact with the lymphoid tissue and much lower dosages and more local effect can be obtained. With x-rays, to obtain the same dosage at the adenoids, a much greater total dosage must be given because of the absorption of the rays in the superficial tissues.

Two types of applicators for irradiation are in use in our clinic. One makes use of radon gas and the other of a radium salt. In each case the radioactive material is confined within the tip of a slender rod 8 to 9 inches long. The metal wall of the applicator acts as a filter. The effective rays given off by radium are beta and gamma rays. Most of the beta radiation is absorbed in the surface layers of the tissue and therefore is more likely to cause erythema than the more deeply penetrating gamma rays. For this reason proper filtering of the radioactive capsules is necessary. We use 0.3 mm. of stainless steel for the radon applicator and 0.3 mm. of monel metal for the applicator containing radium salt.

The advantage of the radon applicator is that much greater radioactivity can be obtained with it than with radium, and thus a shorter period of treatment is required. The disadvantage is that the useful life of such an applicator is only about one week, and it then must be replaced. Also, since the strength changes rapidly, the dosage must be calculated for each treatment.

The radium applicator contains about 50 mg. of anhydrous radium sulfate. It requires only an initial standardization. However, the applicator should be tested occasionally with an electroscope to be sure that a leak has not developed, allowing escape of radon gas. A treatment time of about eight and one-half minutes to each side of the nasopharynx every ten days for three doses is recommended.

It is, first, of the greatest importance to visualize clearly the nasopharynx through a nasopharyngoscope to determine whether or not treatment is indicated and to know exactly where to place the applicators. Small lymphoid nodules between the tubal orifice and the posterior end of the middle turbinate may be responsible for the symptoms.

The technic of treatment is easily carried out. With the patient lying on a cot, the applicators are passed along the floor of the nose until the tips are in contact with the nasopharynx. It is essential that the duration of the treatment be carefully timed if ill effects are to be avoided. Local anesthesia with 10 per cent cocaine or pontocaine can be used for children or for adults with any nasal obstruction. Usually three to five treatments at ten day intervals are required. No treatments should be given during the acute stages of a cold, as there is danger of aggravating the cold or of causing otitis media.

Normally functioning eustachian tubes are a prerequisite to good hearing. Nodules of lymphoid tissue in or about the eustachian orifices, which become infected with each cold, will cause mechanical blockage and overproduction of mucus from the glands in the

---

Read before the joint meeting of the Section on Laryngology, Otology and Rhinology and the Section on Radiology at the Ninety-Fifth Annual Session of the American Medical Association, San Francisco, July 5, 1946.

mouth of the tubes. During such episodes acute otitis media or transitory feelings of stuffiness in the ears may develop. If the infection in such lymphoid nodules becomes chronic, catarrhal otitis may develop. In some cases this chronic obstruction is not sufficient to cause earaches or to attract attention by obvious hearing impairment. Nevertheless there may be insidious changes in the middle ear which gradually lead to deafness. These changes are similar in every way, except in abrupt onset, to aerotitis in aviators, submariners or deepsea divers. Such unhealthy conditions of the nasopharynx are probably more common than is generally believed. In a study of some 1,300 school children by Dr. Crowe and his associates, a high proportion of those whose tonsils and adenoids had been removed surgically showed sufficient regrowth of adenoids in and around the eustachian orifices to cause some hearing impairment. In these children examination of the ears showed retraction of the tympanic membranes, often confined only to Shrapnell's membrane or to the anterior quadrant. When retraction in such a case is minimal, hearing impairment is confined to the higher frequencies and may escape detection by the usual methods of testing the hearing; but, as the condition progresses, successively lower tones are involved until the conversational range is reached.

Patients with sufficient obstruction to cause earaches or obvious deafness are those who usually come to the otologist and are the ones on whom the most dramatic results can be obtained. Irradiation should often be only a part of the therapy; adenoidectomy and the use of antibiotics should often supplement the radium treatments.

In Maryland the state department of health has organized several county clinics for the prevention of deafness. Schools are periodically screened for children showing hearing impairment. These children are examined by an otologist, and, when necessary, provision is made for surgical removal of tonsils and adenoids. Usually radiation treatments are given in addition. It is impossible because of poverty, shortage of hospital beds or lack of cooperation of parents to get more than a small percentage of these children operated on. For these reasons radium treatments have been given hundreds of children, and the end results are usually as good as or better than those of operation alone. To avoid recurrence it is necessary that every child who has been treated be followed and that his tympanic membranes, nasopharynx and hearing be examined at least twice a year for two or three years.

The recognition of subclinical obstruction of the eustachian tubes is more difficult and must await a much more comprehensive method of public health examination of school children.

In some instances of nerve deafness or otosclerosis there may also be superimposed conduction deafness due to blockage of the eustachian tubes. If the examination of the tympanic membranes and the nasopharynx establishes a clear indication for irradiation, this treatment should be employed. It may often restore the hearing to a useful level. Of course there is nothing to be gained as far as the primary condition is concerned.

With the increase in air travel, another condition is becoming more prevalent. i. e. the inability to equalize the air pressure in the middle ear with the barometric pressure outside during rapid changes in altitude. This condition has been given the name aerotitis. It was the most common cause of disability due to flying in the air forces during the war. A commission was formed for its study, and the report of the commission has recently been published. It was found in this study that equalization of the pressure in the middle ear was accomplished easily during ascent, but during rapid descent in certain fliers air did not get back into the middle ear. This resulted in negative pressure in the middle ear, causing outpouring of serum and lymph from the vessels, and gave rise to pain, loss of hearing and sometimes mucosal hemorrhages. Examination disclosed retraction, injection of the tympanic membrane and bubbles of mucus in the middle ear. In almost all of these men, nasopharyngoscopy revealed some obstruction of the eustachian tubes by adenoid tissue.

An extensive program of treatment with radium was undertaken, and there was uniformly great improvement in a large percentage of the fliers so treated.

A similar program was undertaken by the submarine forces for treatment of personnel developing aerotitis during ascent in "escape-hatch tests." This group also showed great improvement following radium treatment.

A second group of conditions results from chronic infection of the lymphoid tissue in the nasopharynx. Here the problem is not primarily one of obstruction, since a small amount of infected tissue may play as large a role as a great amount. In children and also in adults one may encounter recurring attacks of purulent rhinitis and sinusitis associated with granular pharyngitis, which have their origin in chronically infected adenoids. This is common in children whose tonsils and adenoids have been removed surgically, especially in allergic children. Radium treatments in conjunction with antibiotics often produce remarkable and permanent improvement, provided the patients are followed and the treatments repeated if symptoms recur. The mere presence of lymphoid tissue is no indication for treatment if the patient has no symptoms. Similarly there are many cases of chronic cough resulting from postnasal discharge that are greatly benefited by irradiation of the nasopharynx.

On reviewing histories of children being treated for deafness, it was observed that some who were asthmatic (usually those in whom cough was a prominent symptom and whose attacks were precipitated by an upper respiratory infection) showed a concomitant improvement in their asthmatic condition during their radium treatments. Several hundred such children have now been treated and carefully studied by a group of doctors composed of an otolaryngologist, an allergist and a pediatrician. The preliminary results are very encouraging in cases due to bacterial allergy. As would be expected, the atopic conditions were less benefited.

In conclusion I should like to emphasize that the purpose of irradiation of the nasopharynx is simply to remove lymphoid tissue, and one can expect improvement of the condition to the extent that the adenoids are the offending agent either by mechanical obstruction or by chronic infection.

When carefully used, as an adjunct to surgery and antibiotics, it offers a powerful therapeutic aid.

Johns Hopkins Hospital—601 North Broadway.

ABSTRACT OF DISCUSSION

Dr. H. A. Fletcher, San Francisco: Many common conditions and symptoms in the ear, nose and throat are dependent on residual hyperplastic lymphoid tissue in the nasopharynx and in the areas of the openings of the eustachian tubes. All of us have been plagued with stubborn recurrent attacks of otitis media in young patients and adults. A great many of these cases have their origin in residual adenoid tissue in the nasopharynx. We can and do recognize the presence of a large mass of adenoid tissue centrally placed in the nasopharynx. Many procedures are difficult, particularly in children and in patients who have a very active gag reflex. It often takes five or six careful and patient examinations to determine the exact conditions we are dealing with, and many of us do not take the time necessary for this. All of us have seen many patients who have had their tonsils and adenoids removed by other specialists or particularly by a general physician and surgeon, and these patients may have large, scattered remains of adenoids or large central masses. Specialists in general are particular in the careful removal of adenoids, but in spite of this in many cases we leave shreds or small areas of adenoid tissue which it was impossible to see or palpate at the time of operation. This particularly applies to the area around the openings of the eustachian tubes and inside the eustachian tube itself, where surgical removal is practically impossible. The use of radium application to the nasopharynx has been proved by Dr. Crowe and his workers over a period of many years to be a definite additional help in the eradication of this important tissue. About a year and a half ago, having failed to get any institution to put in a radium applicator for the treatment of these cases, I purchased an applicator that cost $1,200. I use it regularly after the removal of adenoids in children at the time of operation. Children having recurrent and frequent attacks of otitis media are definitely improved, recurrence is prevented or the incidence of recurrence is much decreased. Cases of recurrent acute serous catarrh and cases which have not responded to prolonged and persistent treatment have cleared up only after the use of radium over three, four or five treatments a month apart. Many children with recurrent pharyngitis, with hobnailed lymphoid tissue in the posterior nasopharynx and adenoid tissue in the nasopharynx, are often cleared up remarkably after three or four treatments, the pharynx becoming smooth and normal in appearance. Adults with frequent recurrent head colds, whose symptoms are the common ones of burning and itching behind the soft palate at the onset of a cold, after three or four treatments have remained free from colds for long periods. One may bring up the question of the use of x-rays in these cases. Naturally what radium does can be duplicated with x-ray treatment. However, it is apparent not only that the dose of x-rays must be much heavier in order to reach the small areas of hyperplastic lymphoid tissue, but also that it must cover a greatly enlarged and unnecessary area. I have time and again seen a dry pharynx following the application of x-rays. With the radium applicator one can apply a much smaller dosage, which is very intense at the point of application, where it is most needed.

Dr. J. S. Mikell, Santa Barbara, Calif.: During the summer of 1944 the professional division of the Air Surgeon's Office called in ten otologists to study the problem of aerotitis, which was responsible for more loss of combat duty than any other condition resulting from flying. After a thorough study of 3,000 crew members it was decided by these ten officers to use irradiation of the hyperplastic tissue in the nasopharynx with radium as a measure to aid in the control of aerotitis. The rationale was that the removal or reduction of this tissue by irradiation would permit better function of the eustachian tube. An extensive program was set up in this country, and four officers were sent overseas, two to England, one to southern Italy, and one to northern Italy and the continent. At the conclusion of this study it was found that the amount of improvement as reported by the various groups varied by only 3 per cent. Of the 636 men who had an adequate follow-up, 87 per cent reported a definite improvement. No ill effects were reported. The study done in the army air force alone is convincing that irradiation of the nasal pharynx with radium is the treatment of choice when there is malfunction of the eustachian tube in the presence of infected hyperplastic lymphoid tissue in or about the tubal orifice.

Dr. Henry J. Ullmann, Santa Barbara, Calif.: I sincerely hope that any remarks I make will not be considered a criticism of this fine paper. A number of points should be kept in mind in considering something which may be assumed by some of the younger men to be something new: The technic is somewhat new. In the first world war reports were made of the use of x-rays in the treatment (especially in the French army) of diphtheria carriers. I have been using the x-rays for enlarged lymphoid tissue for more than twenty years, and I want to emphasize that the action of x-rays and gamma rays of radium on living tissue is essentially the same. I should like to ask Dr. Walzl about the filtration he used, because 0.3 mm. of monel metal will not eliminate all the beta rays. It requires at least 2 mm. I assume that there was 0.2 mm. of gold inside the monel metal, which would cut out about 78 per cent of the beta radiation. I have had similar results with the use of x-rays in all types as described (all referred by otolaryngologists) with the exception of aerotitis, which of course I have not seen. Dr. Nuzum and I in reporting on the bacteriology of irradiated tonsils in 1923 showed that there was no relationship to the change of the flora in the reduction of hypertrophied lymphoid tissue. Radium has its advantage in treating a very local area, but the reduction of adenoids in general has been spoken of and that you cannot do with such localized treatment. As far as persistent dryness is concerned, I would consider that such a result from the use of x-rays is due to excessive dosage and is unnecessary. There are no skin changes, as I use a half value layer of copper of 1.15 mm. and the dose is given every day, every other day or twice a week, as is needed to obtain the desired results. Permanent dryness or dryness lasting more than a week or two should never follow. I was interested to see this revival of the use of radiation in treating enlarged lymphoid or chronically infected lymphoid tissue of the nasopharynx, but remember that the only difference in the use of radium and x-rays, both properly employed, is that radium can be used for a more strictly local effect, if this is desired, as its effect will be confined to a 1 to 2 cm. circle. Beyond that area there will be little effect. I want to warn all the otolaryngologists: If you take up the use of radium, don't burn your fingers.

Dr. Herman Semenov, Beverly Hills, Calif.: I have been interested in this work since 1935, at which time I spent several months with Dr. Crowe. The literature describing lymphoid tissue in and around the eustachian tube, so-called tubal tonsil, is based on some questionable work which was done about 1860, before stains were available. Recently, while working at the Army Institute of Pathology, it was my good fortune to examine some histologic material and review this subject. The important feature of Dr. Crowe's work is that it calls attention to this area once more, puts it on a scientific basis and opens the eyes of a great many people to a neglected region. It is up to radiologists to decide whether x-rays or radium are better. In the army we take what we can get, and at Letterman General Hospital we have good radiologists and use both methods. It all depends on the area that we want to treat. Occasionally there is some lymphoid tissue within the eustachian tube, but it is not very common there, and in most cases treatment of the mouth of the tube is sufficient. The important thing is to know what we are doing and where we are doing it.

Dr. Edward M. Walzl, Baltimore: There seems to be no conflict of opinion in this discussion except perhaps as to the relative merits of the use of x-rays and radium. In addition to the advantages of radium over x-rays enumerated earlier, there are certain conditions in which x-rays would not be feasible, i. e. in our county clinics for the prevention of deafness. In these clinics we often recommend that tonsils and adenoids be removed. Usually the tonsillectomy is perfectly adequate, but on nasopharyngoscopy it is rare to find a thorough adenoidectomy. If deafness is to be prevented, it must be recognized that adenoidectomies are often inexpertly performed, and it should never be sufficient simply to recommend that a tonsillectomy and adenoidectomy be performed. Such children should be reexamined after operation and if necessary given radium treatments. The problem of filtration of the radium capsule was carefully considered. In the applicator containing radium salt the largest amount that can be inserted conveniently into the nose is 50 mg. In order to keep the treatment time within reasonable limits, it was necessary to use a filter allowing penetration of some of the hard beta radiation. These rays certainly have more effect on the surface of the tissue, but experience has failed to show any harmful results from the low dosage used.

SUPERVOLTAGE ROENTGEN THERAPY OF CARCINOMA OF THE ESOPHAGUS

FRANZ BUSCHKE, M.D.
and
SIMEON T. CANTRIL, M.D.
Seattle

To enter again the discussion of roentgen therapy of epidermoid carcinoma of the esophagus with the limited material at our disposal may well appear as a symptom of monomania. The purpose of this discussion, however, is only an attempt to overcome the attitude of defeatism which apparently prevails in the medical profession at large as well as in the minds of surgeons and even many radiotherapists in regard to any therapy of esophageal carcinoma.

This conviction that nothing can be done for an esophageal carcinoma is reflected in the histories of those patients who are finally referred for radiation therapy or come on their own accord when feeding becomes entirely impossible. It would probably still be more impressive if we knew how many patients with a possibly curable carcinoma of the esophagus are never given the opportunity of even an appraisal of. their chance by radiotherapy.

In spite of our particular interest in this problem, we have seen only 19 patients with esophageal carcinoma since 1939. Five of these were in such poor general condition and the lesion so advanced that no therapy could be considered. Six patients, or almost one third, had symptoms for more than nine months, some for considerably longer than a year. Only 1 of these patients was himself responsible for the delay by using a chiropractor for his adviser. The 5 others were either not diagnosed or were treated by inadequate palliative procedures such as dilation or not at all. Seven patients, or more than 30 per cent, had x-ray examinations for symptoms leading to the suspicion of an esophageal carcinoma, but the x-ray findings were supposedly negative until several months later, when a well established obstruction could be demonstrated. In none of these cases had an esophagoscopy been done. In 4 patients valuable time was lost by inadequate procedures such as repeated mechanical dilation obviously done under the assumption that no other treatment was useful. Two patients were frankly advised against treatment after the diagnosis of esophageal carcinoma was established and were told that no treatment would be useful. One of these patients is now well seven years after roentgen therapy. After a recent discussion of our cases in a county medical association meeting, one of the leading internists of the community expressed his surprise that anything could be done for a carcinoma of the esophagus. Again and again we encounter this attitude in the discussion with our colleagues. In each of the cases which we report some kind of inadequate medical advice was given, at least at one time prior to admission to our institute.

The reasons for this pessimistic attitude are obvious: The majority of esophageal cancers, if they are treated at all by radiation, are, as far as our personal experience is concerned, treated with technics that could not possibly be expected to control either a lymphosarcomatous focus in the chest or a carcinoma of the skin. We have seen patients treated with surface therapy with an entirely inadequate dose. Many more are probably treated this way for whom no critical analysis was ever done, but all these patients return to their referring physicians, who register them as another failure of radiation therapy.

The other more legitimate reason for the pessimism is the fact that, so far, no group of esophageal carcinomas has been permanently controlled by any procedure available. Occasional prolonged growth arrests, possibly exceptional cures, have been reported, but these must be considered as curiosities, not as predictable results obtainable with any degree of probability.

By those who conclude from these experiences that any further attempt is useless, it is forgotten that until quite recently no procedure was available that could, on the basis of biologic and physical considerations, be expected to sterilize permanently a carcinoma of the histologic type and at a location such as the thoracic portion of the esophagus, but that in spite of all these shortcomings temporary tumor regressions have been accomplished with a predictable regularity in any larger series of cases treated consistently with an adequate technic skilfully applied. The most convincing evidence is the large series of 161 cases reported by Zuppinger,[1] in which he observed a tumor regression with a temporary improvement of the stenosis in 79 cases, or almost 50 per cent. Similar experiences were reported by Strandqvist.[2] From the reports in the literature, and from our own experience, we can conclude that with 200 kilovolt radiation therapy in about half of the cases of carcinoma of the esophagus which are still in a sufficiently good general condition to support the procedure, temporary reopening of the obstruction lasting from six to eighteen months can be expected. The papillary exophytic growths are more favorable for radiation therapy, which is in accordance with our experience with epidermoid carcinomas elsewhere. The histologic analysis of esophageal carcinomas substantiates the clinical experience that at least a proportion of them represent essentially radiovulnerable carcinomas similar to the radiocurable carcinomas of larynx, pharynx, cervix or oral cavity. Thirty per cent of the carcinomas in Zuppinger's series showed a moderate or low degree of differentiation consistent with radiocurability without intolerable damage to the surrounding structures.

That in spite of this demonstrable radiovulnerability permanent cures so far have not been accomplished

may well be due to mere physical difficulties in applying an adequate tumor dose. We can expect that a tumor of this type will require at least 5,000 roentgens in a period of about forty days for complete sterilization. As we[3] have discussed elsewhere in detail, physical measurements demonstrate that this dose cannot reach a tumor of the thoracic esophagus without intolerable damage to the surrounding structures and without an intolerable deterioration of the patient's general condition if radiation in the medium volt range is used. That this physical problem is in part, at least, responsible for the failures is suggested by the observation that the more accessible but biologically very similar tumors of the cervical esophagus and hypopharynx can be controlled in approximately 20 per cent. On the other hand, physical measurements and considerations have shown that with radiation in the million volt range[3] a tumor dose which is probably adequate can well be applied at the depth of the tracheal bifurcation by the use of only one anterior and one posterior field, eliminating in this way the irradiation of a large volume of tissue as is necessary by cross firing through multiple oblique portals. Theoretically, therefore, radiation therapy in the million volt range should accomplish a certain number of cures in esophageal carcinoma if the problem of sterilization is actually one of adequate tumor dose. We therefore felt that the treatment of esophageal carcinoma should be one of the crucial experiments in regard to the question of superiority of million volt radiation if the problem is viewed from the point of view of tumor dose only.

Epidermoid Carcinoma of Esophagus

	Symptoms	Weight Loss	Passage	Gross Type	Location	Total Dose, Roentgens Measured on Skin	No of Fields	Treatment Duration, Days	Estimated Tumor Dose	Immediate Result	Final Result
1. B. B. 47 yrs. ♂	6 to 7 mos	35	S	?	L	9,850	2	46	4,400	Stenosis open 26th day	Well 7 yrs
2. J R. 62 yrs ♂	1 yr.; liquids only for 10 mos.; regular dilat. and x ray therapy	41	(L)	P	M	16,200	2 and 2	81	7,300	Stenosis open; remained open 13 mos	Clinically well 13 mos.; terminal 2 yrs post-treatment; massive fibrosis
3 A R 65 yrs. ♂	2 months	22 ?	L	I	M	12,700	2 and 2	53	5,700	Stenosis open 40th day	Died after 11 mos ; local recurrence liver and node metastasis
4 C. J. 72 yrs. ♂	2 months	..	(S)	I	M	11,925	2	40	5,350	Stenosis open; ulcer crater developed	Died after 10 mos (mediastinitis ?)

Passage: L, liquids can be taken; S, solid food can be taken; SS, semisolids can be taken
Gross type: P, papillary; I, infiltrating.
Number of fields. Boldface number indicates number of main fields (anterior and posterior) through which most of total dose is given
Location: L, lower third; M, middle third of esophagus

The results which we can present so far are very meager, but they are in accordance with our theoretical considerations and are, as we believe, encouraging enough to justify further attempts with this procedure. As can be seen from the accompanying table, only 6 cases have been treated with, as we judge it, adequate therapy. All of them have shown tumor regression with temporary reopening of the food passage. Two of the patients have remained well clinically and radiographically without signs of esophageal pathology for a period of seven years and two years respectively.[4]

The detailed analysis and careful observation during and after treatment of these few cases has taught us what we believe are some pertinent facts, if interpreted in the light of more extensive experience with 200 kilovolt radiation.

The papillary growths are more favorable than the infiltrating types. The interval between the first clinical symptoms which should lead to careful esophageal examination by x-ray and esophagoscopy is in this type longer than in the primarily infiltrating tumors. The duration of freedom from symptoms even in the uncontrolled cases and in spite of the advanced stage of the disease lasted longer in the papillary than in the infiltrating types.

We see again, which is known from experience with all other carcinomas, that a forced increase of dose will not improve the results but will rather interfere with curability through intolerable by-effects. Two of our patients were frankly overtreated and developed pulmonary fibrosis which probably would not have been compatible with life even if the tumors had been controlled. The 2 patients who have remained well for seven years and two years have received fairly low doses. The 1 patient well for seven years has received the lowest dose of the entire group.

We have furthermore learned from the analysis of these cases that treatment with radiation in this range is considerably better tolerated. The skin does not react with more than a very temporary mild reaction with doses sufficient for an adequate depth dose. The general condition of the patient is much less influenced by this irradiation because the fields can be limited to one anterior and one posterior port exactly aimed at the lesion and therefore reasonably small.

Radiation therapy of the esophageal carcinoma still remains a major clinical procedure. It will be tolerated only in patients with incomplete stenosis when feeding is still possible, in patients who have not lost too much weight and whose general condition has remained good enough to support the procedure.

---

[3] Buschke, F. J., and Cantril, S T.: Supervoltage Roentgen Therapy of Esophageal Carcinoma, Radiology 42: 480 (May) 1944.

[4] Details of the first case were published previously.[3] Details of the other cases will be published in a monograph on supervoltage roentgen therapy.

Hospitalization is essential for preservation of strength and proper supervision of enteral or parenteral feeding, particularly of fluid and protein intake. The response to irradiation must be observed by weight record, by careful interpretation and evaluation of symptoms (such as improvement or deterioration of swallowing, pain, coughing) and by repeated fluoroscopies with careful search for a possibly developing ulceration with the imminent danger of a perforation leading to mediastinitis. Particularly in elderly patients, supervision and support of the cardiovascular system and avoidance of secondary infections, particularly of the respiratory organs, is essential.

A preliminary gastrostomy should be avoided. A patient who needs a gastrostomy will usually be in too poor condition to support radiation therapy. For the treatment in the medium volt range we definitely refuse patients who have had gastrostomy because we feel that in this voltage range the only purpose of the procedure is to reopen the obstruction and avoid gastrostomy. The preliminary operation therefore defeats this purpose. In cases to be treated with million volt radiation this attitude may possibly be revised very occasionally when a cure might still be hoped for but when the general condition due to starvation is too poor to support the treatment. In none of our cases was a gastrostomy done. In patients in whom the general condition was poor because of starvation it was always possible by proper adjustment of the treatment to overcome the stenosis eventually so that the general condition improved sufficiently to support the major portion of therapy. The improvement of the general condition following reopening of the stenosis is sometimes dramatic. At times it is difficult to judge by a preliminary examination whether the poor general condition is due to starvation or to tumor cachexia. We have therefore occasionally accepted and will continue to accept some patients for a therapeutic trial and discontinue treatment if the general condition continues to decline during treatment.

We believe that probably a number of epidermoid esophageal carcinomas can be cured if the diagnosis is made in a reasonably early stage and radical therapy instituted before obstruction is complete or the disease has spread to the regional lymph nodes. It is unlikely that lymph nodes secondary to carcinoma of the esophagus, once they have developed, will be any more curable than lymph node metastasis secondary to most epidermoid carcinomas.

The possibility of improvement of radiation results is greater for esophageal than for bronchogenic carcinoma. Distressing symptoms appear earlier, and the chance of recognition is therefore better at a time when the regional nodes may not yet be involved. In bronchogenic carcinoma the paucity and vagueness of symptoms will usually not permit a diagnosis at a time prior to lymphatic involvement. We therefore feel that a further attempt at supervoltage irradiation for carcinoma of the esophagus in carefully selected cases may not be entirely fantastic.

1211 Marion Street.

ABSTRACT OF DISCUSSION

DR. ROBERT S. STONE, San Francisco: The authors are right in saying that there has been too much of a defeatist attitude toward carcinoma of the esophagus and that too few of us have been willing to try. This was exemplified in my clinic by a patient who has now been alive over six years having had a lesion of the esophagus so extensive that no one thought he would live any length of time. We should try to do everything for these patients if there is any hope at all. There is one feature which is going to come up in the next few years which will teach us a lot more about early carcinoma of the esophagus, and that is that surgeons have now developed their technic for thoracic surgery to the point where we are going to have a hard time getting carcinomas of the esophagus to treat. We shall learn a lot more about carcinoma of the esophagus when the surgeons try to remove the early ones. The authors thought they might be able to prove the advantage of million volt therapy over other therapy by getting doses into the depths. I shall have to disagree with them that they will be able to prove it with carcinoma of the esophagus. One can prove it with a phantom, that one gets the depth dose in better with a million volt than with a 200 volt dose, but in a carcinoma of the esophagus one is up against a proposition not similar to other parts of the body, namely a very thin walled tube with but little support, so that one is likely to have a thin scar wall as the result of treatment or an actual perforation. I have lost patients who apparently were cured of their carcinoma. It had disappeared, but 1 died with pericarditis, and in 1 the perforation was seen very small but definite, and in another case I had to hypothecate that the infection had been able to pass through a damaged wall easier than it had a normal wall. The lesson to be learned from this presentation is that it is worth while trying to go ahead in these cases with the highest voltage so that one can avoid using large fields and cut down on the amount of tissue that one needs to irradiate in order to build up a dose inside by scatter. This is one of the few fields in which that can be accomplished by supervoltage radiation.

DR. MAURICE LENZ, New York: Treatment of cancer of the esophagus is handicapped by its tendency to spread longitudinally early, to ulcerate extending through its 4 mm. thick wall, with consequent mediastinitis, and to metastasize to the mediastinal lymph nodes. Operative and postmortem reports show that clinical estimates of the extent of involvement are frequently inaccurate in spite of esophagoscopy and x-ray examination. Because of these unfavorable conditions the few reported five year cures are chiefly in early, small, noninvasive growths treated before they have become inaccessible to esophagectomy, intracavitary radium or external treatment with x-rays. Although operative mortality after esophagectomy has been slightly lowered in recent years, it is still a serious drawback to surgical treatment. Added to this objection are the need for a permanent gastrostomy in growths of the cervical and thoracic esophagus, and for laryngectomy in cases extending forward toward the larynx. It is chiefly in the lower third of the esophagus, which is surgically more accessible, that improvement may be hoped for from operative treatment. Adequate tumor dosage by intracavitary radium can be administered only to those cancers which are relatively small and superficial. On account of the rapid fall of intensity of radiation with increasing distance from intracavitary radium, only inadequate tumor dosage can be delivered by this approach to the base of larger fungating or invasive growths, their exterior surface being farthest away from the radium. In view of this irreducible handicap, this method of irradiation can be expected to remain a palliative measure in all but the very rare early lesions. Five year clinical arrests of cancer of the esophagus with 200 kilovolts have been observed practically only in the more accessible cervical portion of 4 patients with postcricoid epithelioma involving the mouth of the esophagus treated with 200 kilovolt rays at the Presbyterian Hospital. Two died soon after treatment; 1 cancer recurred six years after therapy; 1 patient is well ten years after treatment. No important radiosensitive organs except perhaps the arytenoid cartilages have to be included in irradiating the cervical esophagus, and adequate tumor dosage is usually well tolerated. In the region of the thoracic esophagus, tolerance for adequate dosage is impaired by the danger of radiation pneumonitis with consequent pulmonary radiation fibrosis, especially if large areas of the lungs are irradiated. Other organs also may be injured. Buschke and Cantril's two long survivors received tumor doses of a little less than 5,000 roentgens, but given in forty-six days and through single anterior and posterior fields. When they increased their dose beyond this, they caused fibrosis of the lungs. The chief merit of their presentation is that they suggest a way to avoid pulmonary and other injury, while administering adequate tumor dosage. If roentgen therapy at 1,000 kilovolts or higher voltage is to improve the statistics of the treatment of cancer of the middle portion of the esophagus, it will be along the lines suggested by them. These are treatment of earlier lesions, reduction in the radiation injury to the mediastinum and lungs by accurately applied, limited radiation fields, and prolongation of the treatment time.

Dr. Paul Holinger, Chicago: This paper is of particular interest because we are all looking for some type of therapy to offer the patient with carcinoma of the esophagus. The surgeon has made tremendous advances in this field and deserves great credit. When the cancer is operable we should urge the patient to consider the surgery that we all know is curing some of these patients. Have biopsies been taken of all patients? Are the results in this series influenced by the character of the lesion? We all know the relative curability of the lesions in the upper esophagus, which are usually squamous cell lesions. On the other hand, with lesions in the lower esophagus, generally adenocarcinomas, the response to irradiation, in my experience at least, has been much less favorable. The authors can give more information concerning these points. They did mention that the papillary type of lesion responded more readily than the other lesions, but my feeling in the matter is that patients with adenocarcinomas in the lower esophagus are generally hastened in their death by the irradiation rather than assisted by it. Possibly it is a question of dosage, possibly a question of the character of the million volt type of therapy that is being discussed. Are the lesions discussed in the cervical esophagus or the midthoracic esophagus, or are they in the cardia just above the stomach, possibly extensions of the gastric carcinomas?

Dr. Louis Daily, Houston, Texas: I worked out a system of treating these patients with radium by applying the radium directly into the tumor mass. I have had good results with early cancer; with late cancer it is only palliative, but I have made the patient more comfortable and prolonged his life. An old man in whom I diagnosed an early carcinoma of the esophagus was first treated with x-rays, which aggravated the condition. I decided to try radium, as I have been using it in our City-County Hospital. There was a definite improvement. I used it about every six weeks. I worked out this method: I put into the esophagus the esophagoscope and used a rubber bushing that requires force to pull out. A capsule is included in the dental compound, and I trim it and cut it down to the size I require; then I tie the strings and put it through the bronchoscope into the tumor and let it stay there. Usually a 50 mg. capsule stays there forty-eight hours. I give the patient about 2,400 mg. hours. If the tumor is very large I use two capsules to give more area. After this patient had been treated for a few months esophagoscopy did not reveal any tumor. He was doing well. After a year he was able to go to his office, and he ate well. In a few months he developed severe epigastric pain, but he could still swallow. Finally the patient had a hemorrhage and I was sure we had overtreated him with the radium. Esophagoscopy did not reveal where the blood came from. A couple of hours later he had another hemorrhage. He lived eighteen months after that. The autopsy did not disclose a tumor. It was absolutely gone in the esophagus, but another tumor, an adenocarcinoma at the head of the pancreas, gave him all the pain.

Dr. Franz J. Buschke, Seattle: In regard to the problem of avoiding a perforation of the thin esophageal wall, I fully agree with Dr. Stone that the problem is not only one of adequate tumor destroying dose. But I am somewhat more hopeful and believe that it may be possible to conduct the treatment in such a way as to allow for fibrous replacement of the tumor tissue before perforation occurs in those cases which do not show an imminent perforation prior to therapy. With the general tendency to discard the very rapid treatment procedures in favor of prolongation of treatment to about eight weeks we may possibly succeed in overcoming this complication, at least in a number of instances. As to Dr. Lenz's remarks on the results of the treatment of the upper esophagus, my cases were all tumors of the thoracic portion and of the lower third. Cases of the hypopharynx and cervical esophagus were purposely not included because a priori supervoltage therapy here should not offer crucial advantages over 200 kilovolt roentgen therapy, which is a well established procedure for these lesions. To answer Dr. Holinger, all patients but 1 had positive biopsies of epidermoid carcinoma. The adenocarcinomas which we have treated were not included in this discussion because they offer a fundamentally different problem. In the case presented, which is apparently controlled for seven years, a biopsy was taken at the Mayo Clinic and a diagnosis of squamous cell carcinoma, grade 2, was made by Dr. Broders. Once (case 6) a positive biopsy could not be obtained because a submucosal infiltration narrowed the lumen so much that the instrument could not be passed to the ulcerative portion of the tumor. Biopsy through the nonulcerated mucosa (in contrast to bronchoscopic biopsies) is an exceedingly dangerous procedure in the esophagus and was therefore avoided. In this particular case the esophagoscopist as well as the x-ray diagnostician had no doubt of the diagnosis of a carcinoma. Concerning the question of local radium application, this was attempted many years ago and given up because of the frequent incidence of perforations. I think that with supervoltage roentgen therapy a more homogeneous application can be accomplished with considerably less risk.

THE DIAGNOSIS AND MANAGEMENT OF SPONTANEOUS HYPOGLYCEMIA

JEROME W. CONN, M.D.
Ann Arbor, Mich.

Harris,[1] in 1924, was the first to emphasize the fact that a fairly characteristic group of symptoms experienced by some persons is the result of a spontaneous fall of the blood sugar to hypoglycemic levels. He suggested that this clinical syndrome be called hyperinsulinism. In the ensuing years there has been developed a large reservoir of detailed knowledge regarding various aspects of spontaneous hypoglycemia. From the point of view of the clinician, the following aspects of this information are of prime importance.

1. *The Multiplicity of Causes of Spontaneous Hypoglycemia.*—Spontaneous hypoglycemia must be regarded merely as a manifestation of an abnormality of carbohydrate metabolism, the cause of which may be one of a variety of diseases. Proof that a group of symptoms complained of by the patient is associated with an abnormally low level of sugar in the blood and that these symptoms can be quickly relieved by the injection or ingestion of dextrose establishes only the nonspecific diagnosis of spontaneous hypoglycemia. It does not imply increased secretory activity of the Langerhans cells of the pancreas, although the latter abnormality is capable, when present, of producing the hypoglycemic symptom complex. Thus, a careful investigative pro-

Read in a Symposium on "Treatment" before the Section on Experimental Medicine and Therapeutics at the Ninety-Fifth Annual Session of the American Medical Association, San Francisco, July 4, 1946.

[1] Harris, S.: Hyperinsulinism and Dysinsulinism, J. A. M. A. 83: 729-733 (Sept. 6) 1924.

gram designed to establish a specific etiologic diagnosis becomes of utmost importance, especially since any hope of successful management (short of treating or attempting to prevent individual attacks by giving carbohydrate) must depend on establishment of the cause.[2] The etiologic possibilities are classified in table 1.[3]

2. *A Diagnostic Awareness of the Possibility of Spontaneous Hypoglycemia as a Cause of Symptoms.*—Despite the years that have elapsed since attention was first directed to this syndrome, physicians in general have not developed a sufficiently keen consciousness of its existence. As is the case with other conditions, those who are aware of the possibility of spontaneous hypoglycemia as a cause of symptoms recognize many cases, while those who are not see none. Among the many erroneous diagnoses which have been made in this complex are brain tumor, epilepsy, acute alcoholism, encephalitis, neurocirculatory asthenia, cardiac neurosis, various psychoses, atypical angina pectoris and peptic ulcer.

3. *An Insight into the Abnormal Physiology Involved in the Various Types.*—Depending on the etiology, rational management must be directed at (*a*) surgical removal of the cause (as in the case of a secreting pancreatic insuloma) or (*b*) medical measures designed to keep the blood sugar level within normal bounds. The surgical approach is indicated in only a small percentage of the total number of cases of spontaneous hypoglycemia. In the large group not requiring surgical intervention a regimen of medical management which is highly successful in one type will decidedly intensify the hypoglycemia in another type. In fact, criteria for differential diagnosis are based, among other things, on response of the patient's blood sugar level to certain test dietary procedures. Thus, both differential diagnosis and treatment of the various types of spontaneous hypoglycemia require a working knowledge of the abnormal mechanism responsible for the hypoglycemia in each case. A blood sugar level of 30 mg. per hundred cubic centimeters in the fasting state carries an entirely different significance from the same level determined, for example, during the course of a dextrose tolerance test.

DIFFERENTIAL DIAGNOSIS OF SPONTANEOUS HYPOGLYCEMIA

A detailed discussion of each type of spontaneous hypoglycemia (table 1) is beyond the confines of this presentation, nor is it entirely necessary. Three of the entire group of causes are responsible for over 80 per cent of all cases of spontaneous hypoglycemia. They consist of (1) functional hyperinsulinism (see synonyms in table 1), (2) organic hyperinsulinism and (3) hepatogenic hypoglycemia.[32] This group of causes is important not only from the point of view of numbers but also because considerable confusion exists concerning differential diagnosis. Since the therapeutic approach is entirely different in each of these types, emphasis will be placed on points of distinction between them. All the other known causes of spontaneous hypoglycemia occur relatively infrequently and, fortunately, are associated with other clinical observations which usually disclose the etiologic factor, as, for example, in cases of Addison's disease, Simmonds' disease, severe renal glycosuria, lactation, partial or total gastrectomy and severe inanition.

In the differentiation of functional hyperinsulinism, organic hyperinsulinism and hepatogenic hypoglycemia the following guides are of greatest value: (1) the level of the fasting blood sugar (*a*) on normal carbohydrate feeding and (*b*) on restriction of dietary carbohydrate or after a short fasting period; (2) the dextrose tolerance curve after a standard dietary preparation;[33] (3) the results of several tests of liver function, and (4) the history and clinical course of the disturbance.[34] Table 2 summarizes the usual distinguishing points in the various types of spontaneous hypoglycemia, and chart 1 shows illustrative oral dextrose tolerance curves obtained in each type of case.

Table 1.—*Etiologic Classification of Spontaneous Hypoglycemia*

I. Organic—recognizable anatomic lesion
  A. Hyperinsulinism
    1. Pancreatic island cell adenoma
      (*a*) Single[4]
      (*b*) Multiple[4]
      (*c*) Aberrant[5]
    2. Pancreatic island cell carcinoma
      (*a*) Localized[6]
      (*b*) With metastases[6]
    3. Generalized hypertrophy and hyperplasia of the islands of Langerhans[7]
  B. Hepatic disease
    1. Ascending infectious cholangiolitis[8]
    2. Toxic hepatitis[9]
    3. Diffuse carcinomatosis[10]
    4. Fatty degeneration[11] or "fatty metamorphosis"[12]
    5. Glycogenosis (von Gierke's disease)[13]
  C. Pituitary hypofunction (anterior lobe)
    1. Destructive lesions (chromophobe tumors, cysts)[14]
    2. Atrophy and degeneration (Simmonds' disease)[15]
    3. Thyroid hypofunction (? secondary to pituitary hypofunction)[16]
  D. Adrenal hypofunction (cortex)
    1. Idiopathic cortical atrophy[17]
    2. Destructive infectious granulomas[18]
    3. Destructive neoplasms[19]
  E. Central nervous system lesions (hypothalamus or brain stem, interference with nervous control of blood sugar)[20]
II. Functional—no recognized anatomic lesion but explainable on basis of unusual somatic function
  A. Hyperinsulinism (imbalance of the autonomic nervous system): hypoglycemic fatigue; nervous hypoglycemia; functional hypoglycemia, reactive hypoglycemia[21]
  B. Alimentary hyperinsulinism (rapid intestinal absorption)
    1. After gastroenterostomy[22]
    2. After gastric resection (partial or total)[23]
  C. Renal glycosuria (severe degrees of low renal threshold for dextrose)[24]
  D. Lactation[25]
  E. Severe continuous muscular work[26]
III. Miscellaneous
  A. Factitious (surreptitious insulin administration)[27]
  B. Postoperative hypoglycemia[28]
  C. Severe inanition[29]
  D. Unknown

Based on the clinical characteristics of the three types being considered and on the type of abnormality of carbohydrate metabolism encountered in each,[35] it has been found helpful to classify them in still another way, namely, (1) the fasting hypoglycemias and (2) the stimulative hypoglycemias.

Fasting Hypoglycemia: The best example of this type is that which occurs with diffuse degenerative disease of the liver. Here the lowest level of the twenty-four-hourly blood sugar curve occurs after the longest period without food, which means just before breakfast. Attacks of hypoglycemia are infrequent during the day (unless meals are missed) because failure of rapid hepatic glycogenesis allows absorbed dextrose to remain in the blood for a somewhat greater than normal length of time.[36]

Stimulative Hypoglycemia: Functional hyperinsulinism represents a pure type of stimulative hypoglycemia. The fasting blood sugar level is normal and is not abnormally depressed by prolonged fasting. Hypoglycemic attacks occur two to four hours after the ingestion of a meal. Measures designed to prevent the usual postprandial rise of blood sugar (high protein, low carbohydrate diet;[37] premeal insulin[38]) abolish the secondary hypoglycemic dip which follows it.

Table 2.—*The Usual Points of Distinction in Types of Spontaneous Hypoglycemia*

Liver Function	Clinical Course (Progression and Time of Attacks)	Type	Fasting Blood Sugar: Standard Diet	Fasting Blood Sugar: Carbohydrate Restriction or 24 Hr. Fast	Dextrose Tolerance Curve (After Standard Dietary Prep.)
Normal	Not progressive in severity; more frequent under emotional or physical tension; relief by vacations etc.; *attacks 2 to 4 hrs after meals*; no prebreakfast attacks; no effect of skipped or late breakfast	Functional hyperinsulinism	Normal	Normal *	Normal fasting blood sugar (sharp fall to *hypoglycemic levels* between 2d and 4th hour)
Normal	Progressive in frequency and severity; prebreakfast attacks frequent, 2 to 8 a. m.; attacks 2 to 4 hrs. after meals; attacks precipitated by skipped or late meals or exercise	Organic hyperinsulinism	Subnormal (usually below 60 mg./100 cc.)	Subnormal (always below 40 mg./100 cc., usually below 30 mg./100 cc.)	Subnormal fasting blood sugar (low level curve †; sharp fall to severely low levels between 2d and 5th hour)
Usually decidedly diminished	Progressive in frequency and severity; prebreakfast the time of most frequent occurrence, 2 to 8 a. m.; day time attacks rare unless precipitated by a skipped meal; sometimes clinical evidence of hepatic disease	Hepatogenic hypoglycemia	Subnormal (often below 60 mg./100 cc.)	Subnormal (always below 40 mg./100 cc., often below 30 mg./100 cc.)	Subnormal fasting blood sugar (hyperglycemic plateau curve with glycosuria; gradual fall to hypoglycemic levels in 4 to 7 hours)

* *During three days of severe carbohydrate restriction most normal persons show fasting blood sugar levels of 50 to 60 mg. per hundred cubic centimeters.*

† See text under organic hyperinsulinism, the dextrose tolerance test.

Organic Hyperinsulinism: This syndrome represents a combination of both the fasting and the stimulative types of hypoglycemia. Attacks occur in the prebreakfast period (fasting hypoglycemia) but are also common two to four hours after meals (stimulative hypoglycemia). Evidence of a continuously excessive secretion of insulin is found in the fact that a short period of fasting invariably produces hypoglycemia. In addition, however, the excessive amount of functioning islet tissue responds to the physiologic stimulus (ingestion of carbohydrate food) with an excessive delivery of insulin.[35a] A careful clinical history, therefore, may afford a good deal of insight concerning the possible cause in a given patient. The hypoglycemia associated with hypofunction of the anterior pituitary gland or of the adrenal cortices falls into the group of fasting hypoglycemias, while that observed in patients who have had a total or subtotal gastrectomy is typically stimulative in type. The latter situation will be mentioned again, since it throws some light on the probable mechanism of the stimulative hypoglycemic group as a whole.

CHARACTERIZATION AND MANAGEMENT OF THE TYPICAL CLINICAL SYNDROMES

The various points mentioned previously will now be integrated with the typical clinical picture as presented by the patient. Illustrative examples of the commoner types of spontaneous hypoglycemia are reported.

Functional Hyperinsulinism

Case 1.—Dr. J. C., a man aged 34, a surgeon, had for eight or nine years experienced waves of intense fatigue, which came on most frequently at about 4:30 p. m. Although hunger was not a prominent symptom he had discovered that eating a candy bar would quickly relieve the attack. In recent years such attacks had also been appearing at about 11:30 a. m. They were more likely to appear during a long morning of work in the operating room; he would suddenly feel extremely weak and shaky, notice a tremor of his hands and be unable to concentrate because he felt "all in." On several occasions he was obliged to leave the operating room. There had never been *attacks during the night or before breakfast.* He was fond of sweets and had been eating from 450 to 500 Gm. of carbohydrate a day.

Physical examination revealed nothing of significance, and except for the dextrose tolerance test all laboratory examinations were within normal limits.

The dextrose tolerance test (1.75 Gm. dextrose per kilogram of body weight orally) gave the following results: The fasting blood sugar level was 71 mg.; the level at one hour was 111 mg., two hours 74 mg., two and one-half hours 64 mg., three hours 64 mg., three and one-half hours 30 mg. and four hours 48 mg., per hundred cubic centimeters. Between the three and one-half and four hour specimens the patient experienced symptoms similar to those observed in his spontaneous attacks.

[38] John, H. J.: A Case of Hyperinsulinism Treated with Insulin: Preliminary Report, Endocrinology **17:** 583-586 (Sept.-Oct.) 1933.

A diet containing 3,000 calories, 120 to 140 Gm. of protein and 75 to 100 Gm. of carbohydrate (three meals daily) was prescribed, to which the patient has adhered rigidly. Within a few days all signs of the previous attacks had disappeared. He has remained symptom free to date (fifteen months) and has been able to perform his daily tasks efficiently.

Terminology: This type of spontaneous hypoglycemia is by far the most commonly encountered. It accounts for at least 70 per cent of all cases of spontaneous hypoglycemia. Although there is considerable difference of opinion as to what this syndrome should be called (table 1), all agree on two points: 1. It represents a disturbance in the nervous regulation of the blood sugar level (vegetative nervous system): this particular abnormality in the finer neural adjustment of the blood sugar level manifests itself in the form of postprandial hypoglycemia under specific circumstances (following meals average or high in carbohydrate when there concomitantly exist conditions of high physical and/or emotional tension) and does not produce hyperglycemia. 2. A diet high in protein and low in carbohydrate [37] (all other things remaining the same) effectively stabilizes the blood sugar and abolishes the postprandial "dips" which are responsible for the symptoms. From a practical point of view it matters little what the syndrome is called so long as it is recognized by its clinical and laboratory characteristics and treated for what it is. Unnecessary exploration of the pancreas in this type of patient yields no insuloma. Unfortunately, such a patient frequently leaves the operating room minus part of his pancreas.

The term "functional hyperinsulinism" has been criticized on two counts: (1) the word "functional" implies a psychogenic element and (2) excessive secretion of insulin has not been demonstrated in these cases. Thus, such terms as "hypoglycemic fatigue," "nervous hypoglycemia" and "functional hypoglycemia" have been suggested, all of which evade the question of how the hypoglycemia is produced. By functional hyperinsulinism is implied an excessive functional sensitivity and responsiveness of histologically normal islet cells to the normal stimulus for insulin secretion. Lack of a method for determining the concentration of insulin in the blood does not invalidate the large amount of indirect evidence which can be cited for such a stand:

1. High carbohydrate feeding in normal animals increases the production of insulin while low carbohydrate feeding diminishes it.[39]

2. The parasympathetic nervous system (vagus) carries secretory fibers to the islets which control the finer regulation of insulin secretion.[40] (The group of patients under consideration are classified as "vagotonic" persons.[41])

3. A rise of the level of sugar in blood entering the pancreatic artery results in an increased "blood-sugar-lowering effect" of the blood leaving the pancreas.[40b]

4. A short period of carbohydrate restriction diminishes the capacity of normal men and animals to metabolize a test dose of dextrose.[42] This suggests diminished insulin activity.

5. Patients with functional hyperinsulinism respond well and promptly to low carbohydrate feeding. It seems difficult to explain how a diet low in carbohydrate can prevent postprandial hypoglycemia unless insulin activity is diminished by this procedure.

It is considered, therefore, in the light of present knowledge, that the term functional hyperinsulinism is justified and defines the clinical syndrome more sharply than the other nonexplanatory terms now in common use.

Clinical Characteristics: The major clinical characteristics of functional hyperinsulinism in contradistinction to the more serious and severer types are tabulated in table 2. The type of person subject to such episodes, however, is of particular interest. I have come to regard this group as reacting excessively not only to the insulogenic stimulus but to most physiologic stimuli and to consider them as hyper-reactors in general, manifesting instability of the vegetative nervous system in many ways. Vasomotor instability and gastric hyperacidity are common manifestations. As a group they are extremely conscientious; they shoulder responsibilities well but fret about them and react intensely to minor disappointments. It has been indicated by others [13] that functional hyperinsulinism may fall into the group of psychosomatic disturbances. The hypoglycemia, however, which often produces their most troublesome symptoms can be well controlled by dietary means.

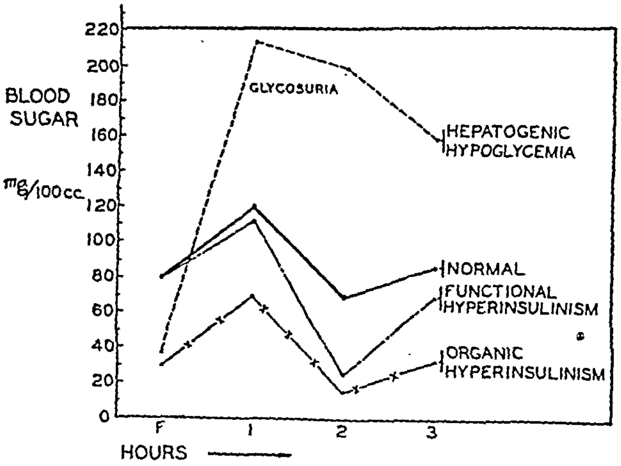

Chart 1.—Dextrose tolerance curves in spontaneous hypoglycemia (three types).

Medical Management: Soon after the recognition of such cases it was found that diets high in carbohydrate were likely to intensify rather than to alleviate the syndrome. It subsequently became apparent that the postprandial rise of blood sugar associated with the absorption of carbohydrate needed to be avoided, since this was apparently the stimulus which produced an abrupt and sharp secondary fall of the blood sugar level several hours later. That avoidance of postprandial hyperglycemia by means of a low carbohydrate, high fat diet on a frequent feeding schedule [44] or by means of premeal insulin administration [38] improved the situation considerably, established the fact that these patients react excessively to the normal postprandial elevation of the blood sugar. In 1936 I [37] reported experimental and clinical evidence indicating the additional advantages afforded by the use of a diet high in protein and at the same time low in carbohydrate. The therapeutic effectiveness of the high protein diet is based on the facts that (1) although protein during its metabolism yields about 50 per cent of its weight as dextrose, the process of glyconeogenesis from protein proceeds at a slow and even rate, resulting, therefore, in no elevation of the blood sugar and consequently no secondary fall and (2) the long period required for the absorption of protein and its conversion to dextrose affords a steady supply of dextrose over a prolonged period of time. These observations on the effectiveness of ingested protein in the prevention of postprandial hypoglycemic symptoms have more recently been experimentally confirmed by Thorn and his associates.[45]

I continue, almost without exception, to obtain excellent results in functional hyperinsulinism by the use of a high protein, low carbohydrate diet. Clinical confirmation by others[47] in patients followed for long periods of time is now available. The average therapeutic diet contains from 120 to 140 Gm. of protein, from 50 to 100 Gm. of carbohydrate and maintenance calories. It is given as three meals a day with the occasional addition of a "protein meal" at bedtime.

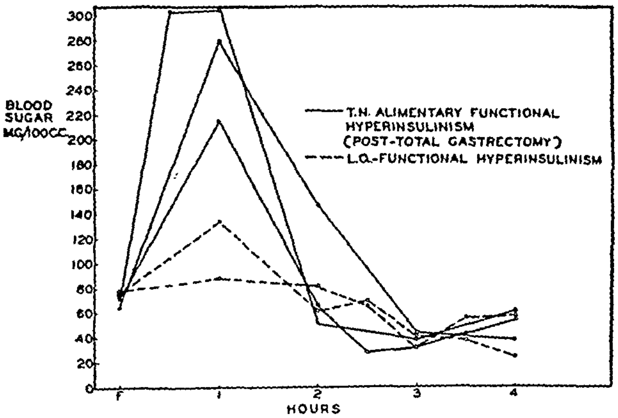

Chart 2.—Alimentary functional hyperinsulinism compared with functional hyperinsulinism by repeated oral dextrose tolerance tests after standard dietary preparation.

Alimentary Functional Hyperinsulinism

A brief discussion of alimentary functional hyperinsulinism (table 1) is apropos at this point, not because this situation should afford any difficulty in clinical recognition but because it helps, by contrast, to clarify several points concerning the mechanisms of the stimulative types of spontaneous hypoglycemia.

Clinicians have been aware for many years that some patients complain after gastroenterostomy of intense fatigue several hours after eating. More recently, this syndrome has been observed even more frequently in patients who have had either total or subtotal gastric resections. An explanation for the symptoms in such patients is apparent when one examines the results of an oral dextrose tolerance test.[47] The curve is characterized by (1) a normal fasting blood sugar, (2) a rapid rise to hyperglycemic levels (usually between 200 and 300 mg. per hundred cubic centimeters) during the first hour after ingestion of dextrose and (3) a precipitous fall to hypoglycemic levels between the second and the fourth hour. Chart 2 contrasts the curve obtained in functional hyperinsulinism of the usual variety with that obtained in most persons after total resection of the stomach. In the latter group it seems clear that the initial hyperglycemic phase results from excessively rapid intestinal absorption of dextrose. Removal of the pyloric valve allows the dextrose to be "dumped" rapidly on the absorbing surfaces of the small bowel. Since abnormal elevation of the blood sugar level in the presence of normal function of the islet cells affords an excessive insulogenic stimulus, the secondary hypoglycemic phase of the curve is understandable. Evensen[22] and others[23] have demonstrated this type of curve in normal persons to whom dextrose was administered by duodenal tube.

I believe that the postprandial hypoglycemia seen in these patients and in those of the group which is called functional hyperinsulinism is the result of a sudden and abnormally large release of insulin into the blood. I wish, however, to make a sharp distinction between the mechanism involved in each type. Functional hyperinsulinism represents an excessive responsiveness of the insulogenic mechanism to the normal physiologic stimulus (no abnormally high initial elevation of the blood sugar level). Alimentary functional hyperinsulinism, on the other hand, represents the normal response of the *normal* pancreas to an abnormally great stimulus (abnormally high initial elevation of the blood sugar level). Thus, it illustrates a functional pancreatic response of another type.

Medical Management: Since abnormally rapid intestinal absorption of sugar accounts for the initial hyperglycemia, which in turn calls forth an excessive insulogenic response, measures designed to prevent abnormal postprandial hyperglycemia should be successful. Excellent results have been obtained with the same type of dietary management as that outlined for functional hyperinsulinism (high protein, low carbohydrate feeding).

Organic Hyperinsulinism

Case 2.—A. P.,[48] a white man aged 25, a single laborer, had been perfectly well until his initial attack in August 1941. While at work at 11:30 a. m. he suddenly became extremely weak and lost consciousness. He awoke spontaneously in thirty minutes and had his lunch. There was no further trouble until a similar episode at 4:30 p. m. occurred in December 1941.

In mid-January of 1942 attacks became more frequent and progressed in frequency and severity until the time of admission to the University Hospital. They began to occur most frequently in the early morning hours (4:00 a. m. to 7:00 a. m.) but often occurred three to four hours after the preceding meal. Premonitory symptoms were hunger, tension, weakness, sweating and visual disturbances. These were followed by a semi-lucid period during which the patient was aware that he could not control his muscular movements. He knew that he was unable to comprehend commands during this period although he heard them. Complete loss of consciousness was often associated with generalized convulsive movements.

(*c*) Gorsuch and Rynearson.[30a] (*d*) Bernstein, S. S.: Hyperinsulinism, J. Mt. Sinai Hosp. **12**: 66-78 (May-June) 1945.

He did not believe that convulsions occurred during those attacks in which he was found to be unconscious in bed before breakfast. The patient's sister, with whom he was living, has a diabetic child who receives daily injections of insulin. The sister noted the similarity of his symptoms to those of her child during insulin reaction and found that he, too, could be quickly revived by the administration of orange juice. The patient then learned that he could ward off daytime attacks by the ingestion of food if he acted promptly.

By the time of admission attacks had progressed in frequency to an average of two per week. The patient's weight had been constantly at about 150 pounds (68 Kg.) for several years.

The patient was a well developed, healthy looking young man. The blood pressure was 100 systolic and 60 diastolic. No physical defects were apparent on examination.

Laboratory examinations revealed that blood counts, urinalysis and Kahn tests were negative; the spinal fluid was normal. The basal metabolic rate was minus 4 per cent. The serum proteins totaled 7.8 Gm., with albumin 4.6 Gm. and globulin 3.2 Gm., per hundred cubic centimeters. The sulfobromophthalein sodium test (5 mg. per kilogram of body weight, thirty minutes) showed less than 15 per cent retention. A cholecystogram showed a normally functioning gallbladder without evidence of stone. A roentgen examination of the skull revealed normal conditions. The dextrose tolerance test after standard dietary preparation disclosed the following blood sugar levels: fasting 31 mg., one hour 101 mg., two hours 83 mg., two and a half hours 77 mg., three hours 52 mg., three and a half hours 37 mg., four hours 31 mg., four and a half hours 25 mg., five hours 44 mg., five and a half hours 31 mg. and six hours 29 mg. per hundred cubic centimeters.

Daily fasting blood sugar values ranged from 12 to 60 mg., the majority from 25 to 35 mg., per hundred cubic centimeters. Blood sugar values during spontaneous attacks ranged from 9 to 30 mg. per hundred cubic centimeters.

At operation (Dr. F. A. Coller) a firm, round, well encapsulated mass 1 cm. in diameter was found to be deeply embedded in the body of the pancreas. This with a surrounding portion of pancreatic tissue was removed and proved to be an islet cell tumor.

The morning after operative intervention the level of fasting blood sugar was 115 mg. per hundred cubic centimeters. For the next seven days it was 73, 63, 98, 78, 83, 92 and 82 mg., per hundred cubic centimeters. A dextrose tolerance test (after standard dietary preparation) three months postoperatively was as follows: fasting blood sugar level 72 mg., one hour 90 mg., two hours 73 mg., two and a half hours 64 mg., three hours 52 mg., three and a half hours 66 mg. and four hours 74 mg., per hundred cubic centimeters.

The patient has returned to his job and has remained perfectly well to date.

Indications for Exploration of the Pancreas: The clinical and laboratory characteristics presented by this patient conform to those outlined in table 2 and afford a clear indication for exploration of the pancreas. When such criteria are satisfied one can predict the presence of a pancreatic insuloma in virtually all cases. It must be emphasized, however, that these criteria are severe and that an occasional early case may fail to satisfy them. Since the characteristic course of the disease is one of progression, such a case will eventually give the typical findings. It may be argued that such severe and rigid criteria tend to delay operative intervention and increase the possibilty of complications, such as malignant change in a benign adenoma of islet cells or degenerative changes in the central nervous system. But if such diagnostic criteria are relaxed a large number of patients who harbor no insuloma will be operated on unnecessarily, and many of them will give up to science a part of their pancreas. Furthermore, in the cases thus far reported the duration of the hypoglycemic syndrome bears no relationship to incidence of malignant tumors of islet cells.[49]

The Dextrose Tolerance Test: It is the opinion of many [50] that the dextrose tolerance curve is of little value in differentiating organic hyperinsulinism from other types of spontaneous hypoglycemia. This opinion is based on the fact that some patients from whom a pancreatic insuloma has been removed have responded preoperatively to ingested dextrose with a high, plateau, diabetic type of blood sugar curve. It has been suggested, among other things, that in many cases the abnormal secretion of insulin is paroxysmal rather than continuous. Were this the case one would expect that a short period of fasting or of carbohydrate restriction would not always and in all patients produce a severe degree of hypoglycemia. Yet it is agreed by all that this is the most important single diagnostic criterion and that operative intervention is not indicated unless this criterion is satisfied. Thus, in the fasting state, at least, there appears to be continuous and excessive secretion of insulin. Frazer [51] and I,[35a] with our associates, have concluded from metabolic studiés that insulin secretion is excessive at all times in well established cases. If in the early stages of this disease excessive production of insulin is erratic and intermittent it will obviously be difficult in this period to establish diagnostic criteria which will separate cases of insuloma from other forms of spontaneous hypoglycemia.

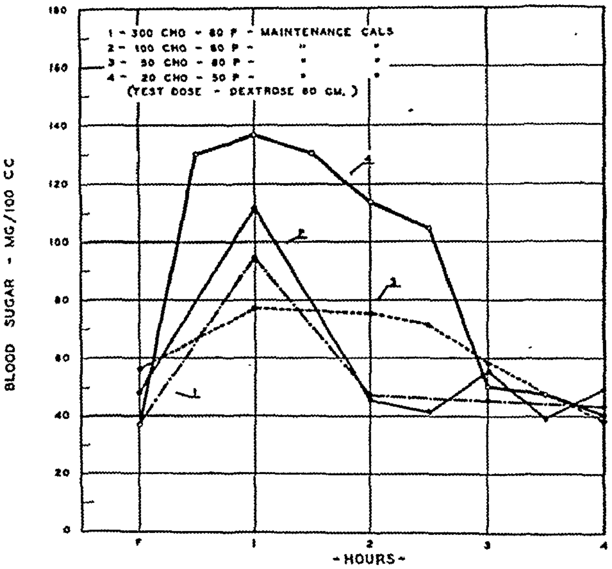

Chart 3.—Effect of previous diet on dextrose tolerance curve in organic hyperinsulinism.

While the question of what may be responsible for the variability in the dextrose tolerance curve in well established cases requires, and is receiving, further investigation, it is known that the composition of the antecedent diet represents one important factor in determining the shape of the dextrose tolerance curve in insuloma patients (chart 3) as well as in normal persons.[53] I believe that the use of a standard preparatory diet [53] will eliminate one cause for the differences obtained in different patients and, in fact, in the same patient.[52]

51. Frazer, R.; Maclay, W. S., and Mann, S. A.: Hyperinsulinism Due to a Pancreatic Islet Adenoma, Quart. J. Med. 31:115-135 (Jan.) 1938.

52. Hoefer, Guttman and Sands.[49] Bernstein.[50]

The practical importance of the dextrose tolerance curve as a differential diagnostic point lies in the fact that an extremely low fasting blood sugar level followed by a high plateau type curve (after standard dietary preparation) is the response which is expected and found in hepatogenic hypoglycemia, which is discussed later in this paper.

Management: When the diagnostic criteria for organic hyperinsulinism have been satisfied surgical treatment is indicated and should be urged. Medical management of these cases is notoriously unsuccessful. While in the early stages of this syndrome dietary management may afford temporary relief, the disturbance soon progresses to a point where such efforts are in vain. In cases in which operative intervention is refused a worthwhile temporary expedient is the use of epinephrine in oil (1 mg. subcutaneously twice a day).[53]

The brilliant results of operative removal of insulomas in this group of cases marks a most pleasing chapter in the history of surgery. Careful and complete exploration of the pancreas has led to the discovery of insulomas in a large percentage of cases (in Whipple's series,[7a] in 27 of 32 cases in which operation was performed, or 84 per cent). Removal of these tumors results in complete alleviation of the entire disturbance without recurrence in the vast majority of cases.

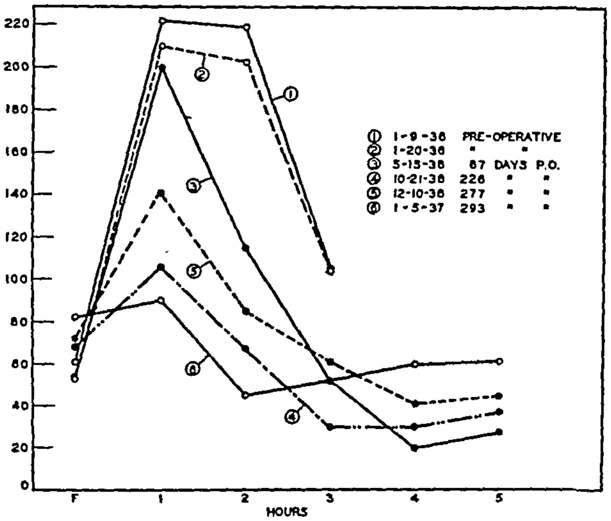

Chart 4.—Glycemic response to the ingestion of 105 Gm. dextrose (same preparatory diet for several days before test).

Points of great importance, particularly to the surgeon, involve the questions of (1) multiple adenomas of islet tissue, (2) indications for partial or subtotal pancreatectomy where no tumor is discovered, (3) sites of most frequent occurrence of aberrant pancreatic tissue and (4) what, short of metastases, constitutes malignancy of islet tumors. All these questions are detailed elsewhere.[54] However, I again wish to express the opinion that a successful result following partial or subtotal pancreatectomy means that an insuloma or a group of microscopic insulomas have been included in the resected portion of the pancreas and that an unsuccessful result indicates the need for further exploration of the remaining pancreatic tissue. In Whipple's series [7a] an overlooked tumor was found at a second operation in 8 patients, and in 7 of these the tumor was located in the head of the pancreas.

Attempts to eliminate excessive islet tissue by nonsurgical means have been made, but to date such efforts have not been successful. "Diabetogenic" anterior pituitary extracts,[49] adrenal cortical extract [55] and alloxan [56] have been tried. Further work along these lines may have promise for the future.

Hepatogenic Hypoglycemia

Case 3.—W. F., a white man aged 47, a laborer, had been in good health until March 1934, when he began to have periodic attacks of unconsciousness. These episodes always occurred between 3 and 7 a. m., which was from nine to twelve hours after the evening meal. The duration of an attack had varied from one to thirty-six hours. There had been no postprandial attacks. Omission of a meal had been noted to precipitate an attack. There had been no symptoms referable to disease of either the gallbladder or the liver. Elsewhere a diagnosis of intracranial tumor had been made because an attack had been terminated quickly by the administration intravenously of a 50 per cent dextrose solution.

Studies at the University Hospital in 1936 revealed the following significant points: (1) dextrose tolerance test after standard dietary preparation: fasting 60 mg., one hour 220 mg., two hours 218 mg., and three hours 105 mg. of blood sugar, per hundred cubic centimeters; (2) provocation of severe hypoglycemia by restriction of dietary carbohydrate (fasting blood sugar levels between 14 and 18 mg. per hundred cubic centimeters on six occasions); (3) decided impairment of hepatic function as indicated by a variety of tests; (4) roentgenologic evidence of cholelithiasis, and (5) prompt relief of attacks by means of a high carbohydrate, high protein diet which included a meal before retiring.

Operation.—The pancreas was normal. The hepatic surface was diffusely granular, and a biopsy showed active chronic cholangiolitis leading to early biliary cirrhosis. A grossly purulent gallbladder containing stones was removed.

The postoperative period was remarkable in that all previous evidence of impaired hepatic function gradually disappeared. Paralleling the improvement of other functions of the liver, the glycogenic and glycogenolytic functions improved (chart 4) and the hypoglycemic syndrome disappeared. The ability to maintain a normal level of the fasting blood sugar without the aid of a bedtime meal returned. No attacks occurred for thirteen months. The patient then died suddenly of acute myocardial infarction.

Management: Hepatogenic hypoglycemia is the result of diffuse degenerative changes in the parenchyma of the liver.[57] In acute degenerative lesions of toxic origin (carbon tetrachloride, cinchophen, hydrazine and smoke) the administration of large amounts of carbohydrate and protein by mouth or parenterally (as dextrose and amino acids) is indicated. If the hepatitis does not prove fatal, the hypoglycemia will have been only temporary, and complete restoration of the function of the liver with respect to blood sugar regulation is likely. In chronic, progressive, destructive and degenerative lesions of the liver the attending hypoglycemia (when present) can be controlled only by preventing long intervals without food. A high carbohydrate, high protein diet arranged to include a meal before retiring at night will usually control the hypoglycemia, which almost always occurs before breakfast.

[57] Footnotes 8, 9, 10 and 11.

In a small group of cases of hepatogenic hypoglycemia in which the hepatitis is due to an ascending infection of the biliary tract, removal of the source of the hepatitis (gallbladder) may allow sufficient restoration of hepatic function to completely overcome the hypoglycemic syndrome. The case just described represents a good example of this rare situation.

SUMMARY

A diagnostic awareness of the possibility of spontaneous hypoglycemia represents the first step in the recognition of the relatively large number of patients suffering from this characteristic syndrome. With hypoglycemia established as the cause of the symptoms in question, the next step is to determine, by differential diagnostic methods, the specific etiologic factor in the individual patient. A rational approach to therapy and a successful result are dependent on discovery of the cause, since the indicated treatment (surgical or medical) varies with the specific etiology of the hypoglycemia. Of the many possibilities classified, three have given greatest difficulty in differential diagnosis and comprise 80 per cent to 90 per cent of all cases of spontaneous hypoglycemia. They consist of (1) functional hyperinsulinism, (2) organic hyperinsulinism and (3) hepatogenic hypoglycemia. Clinical and laboratory criteria, helpful in distinguishing one type from another, are available.

A high protein, low carbohydrate diet is successful in the management of functional hyperinsulinism. Organic hyperinsulinism requires pancreatic surgery. A diet both high in carbohydrate and high in protein is indicated in cases of hepatogenic hypoglycemia. Of patients whose disease falls in the latter group, a select few will be benefited by cholecystectomy.

ABSTRACT OF DISCUSSION

Dr. Howard F. West, Los Angeles: I think that gratitude should be expressed to Dr. Conn, Dr. Newberg and their staff for their contributions to this important clinical subject, and for the clarity with which they have established the subdivisions of the hypoglycemias from the standpoint of etiology and the criteria for treatment. Especially in regard to the so-called functional group, there is evidence that clinicians are too content with a diagnosis of hypoglycemia. One can find a relatively low blood sugar in many patients at times, with or without characteristic symptoms. Many of these persons are unstable in other directions as well. Other factors in their constitutional makeup—including their somatic disorders—should be given full consideration at the same time as an evaluation is being made of the significance, if any, of the blood sugar level. I would like to illustrate the hepatic type of hypoglycemia with one personal experience. The patient, a chronic alcoholic addict, suffered an attack of acute hepatitis with jaundice followed after four years with a chronically enlarged and somewhat damaged liver. There was a disability problem. His insurance carrier sent him to a competent internist for an opinion. This physician, who noted a moderate glycosuria, performed a dextrose tolerance test. Although the fasting blood sugar was within normal limits, after the administration of dextrose it was 200 mg. per hundred cubic centimeters or over for over two hours, with accompanying glycosuria. A diagnosis of diabetes was submitted. The patient's own physician, an equally competent internist, saw him in the late afternoon after the patient had taken a two mile walk. At this time he complained of weakness, tremor, sweating and blurred vision; his blood sugar was found to be extremely low, and a report of hypoglycemia as a cause of symptoms was rendered. These reports were confusing to the carrier so I was asked to review the story. Within certain limitations both physicians were correct, but in evaluating these liver problems one must be sure to consider the blood sugar range through a complete cycle and not to be concerned with certain phases only, which may be misleading.

Dr. E. Kost Shelton, Los Angeles: Physicians owe much to Dr. Conn and his associate Dr. Newberg for their long and comprehensive study of carbohydrate metabolism, especially as it is related to disorders other than diabetes. It was Dr. Conn's work a number of years ago on the effects of protein and carbohydrate ingestion on the dextrose tolerance curve which stimulated my early interest in this subject. His presentation today is up to his usual high standard. Certainly, it is important to differentiate the various etiologic factors in hypoglycemia, especially those of a functional nature. These simple points which Dr. Conn has already mentioned are of value: 1. Nearly all functional hyperinsulin states show normal fasting blood sugar levels. Organic hyperinsulin states show low fasting blood sugar levels, especially after a more prolonged fast. 2. In functional states there is immediate improvement when excess carbohydrate ingestion is terminated, especially when relatively large amounts of protein are added to the diet. This is not true of organic states. The insulin tolerance test has also been found of considerable value in reaching a conclusion in regard to some hypoglycemic conditions, especially those accompanying panhypopituitary states and Addison's disease. In 1 case of fugitive acromegaly the insulin tolerance test was the deciding factor in differentiating between a hyperactive and hypoactive status, and this knowledge completely reversed the treatment. Some years ago I set out to find a common physiologic factor in overweight and must have performed over a thousand four hour dextrose tolerance tests before I realized that they did not represent the true status of carbohydrate utilization at all. However, from these studies and subsequent ones, I gained a few impressions, regarding which I should like to ask Dr. Conn to comment. I consider that there is such a thing as relative hypoglycemia—that some patients have symptoms of hunger or nervousness or other autonomic manifestations when the level of blood sugar falls, after dextrose ingestion, even though it does not fall to so-called hypoglycemic levels. I feel that this is part of the mechanism of hunger and is important in hyperphagia or overeating, and that this hyperphagia subsides to a remarkable degree when carbohydrate, as such, is almost eliminated from the diet and protein is substituted instead. Since the brain only uses carbohydrate and the mechanism for most of these functional disorders is autonomic (probably hypothalamic), is it not possible that there is some relationship between "carbohydratism" and "alcoholism"? Carbohydrate addicts appear to me to be about as emotionally unstable as alcoholic addicts, and I believe they lie more frequently.

Dr. Elmer L. Sevringhaus, Nutley, N. J.: My experience leads me to concur completely with the diagnostic criteria presented. Functional hypoglycemia, which is a common experience, may lead to much discomfort. An anesthetist friend for many years made his own breakfast consist of dry cereal with milk, sugar, fruit and much toast. Between 10:30 a. m. and 1:30 p. m. he had to have another lunch, because he couldn't go on in face of hypoglycemic symptoms. I taught him how to cut down the toast, eliminate cereal and substitute bacon and egg, with complete relief. Experience with 4 cases of pancreatic tumor, cured by removal, has led to the observation that failure to find the tumor at laparotomy should not discourage the surgeon, if the diagnostic criteria are satisfactory. On reoperating in 2 such cases, aberrant pancreatic tumor tissue was found. In 1 of these cases the patient was a woman who had not only convulsive disorders from hypoglycemia, but also profound deterioration of personality and amnesia, which put her in the hands of the neuropsychiatrist and then of the neurosurgeon, who thought he had demonstrated an intracranial tumor. The encephalogram and ventriculogram showed bilateral, extensive cortical atrophy of the brain, but fasting blood sugars were below 40. She was given relief by plentiful amounts of carbohydrates. After two operations the pancreatic tumor was found and removed, and the patient was restored to normal physical and mental health. Another patient had only repeated prebreakfast attacks of a convulsive sort. Her sugar tolerance test was suggestive of a postprandial hypoglycemia at the fourth and fifth hours. She had indifferent results from management by diet. She insisted, against advice, on a laparotomy, although it was thought that the chances of a pancreatic tumor were practically nil. At a very thorough exploratory laparotomy nothing was found. The patient obviously belongs in the group who have some type of epileptic seizure which has no pronounced association with the metabolism of sugar. Since these tumors of the pancreas are, like other neoplasms, tissues out of ordinary physiologic control, it is interesting to notice, also, that the sugar tolerance curves are not predictable and uniform, even in the same patient from day to day. In my experience, this lack of uniformity is characteristic of the tumor case as opposed to the functional case, whether it is due to hepatic difficulty with the high level or to the hyposecretory type with the low level, in which essentially reproducible curves are obtained.

Dr. Arthur A. Herold, Shreveport, La.: The paper of Dr. Conn is of such value to the general practitioner that I wish it could be given more circulation amongst the members of the medical profession. In regard to functional hypoglycemia, whenever I see a patient who has been previously treated and put on a diet, he invariably says, "Doctor, that is not the diet I need; that is a diabetic diet," and I frequently have a great deal of difficulty in convincing him that the low carbohydrate, high protein, high fat diet emphasized by Dr. Conn is what he needs. There is one other type of hypoglycemia which I do not believe Dr. Conn mentioned and which is seen occasionally; I refer to the patient with so-called renal glycosuria. I have had several such patients and recall 1 who had a dangerously low blood sugar level in the mornings, but with sugar in the urine and with the postprandial blood sugar level somewhat elevated but still subnormal and heavy glycosuria. This young man was given a high carbohydrate diet, and when last heard from he was getting along all right. I would like to have Dr. Conn discuss this.

Dr. J. W. Conn, Ann Arbor, Mich.: Dr. Shelton asked about relative hypoglycemia. Is it possible for patients to have symptoms at blood sugar levels which are not ordinarily considered hypoglycemic? Yes, I believe it is possible and that I have occasionally seen it, but I think that the phenomenon is easily understandable. Apart from the fact that there are individual differences as to the level of blood sugar at which symptoms appear, the rapidity with which the blood sugar is falling is important; that is, the more rapid the drop, the higher the level at which symptoms appear. A precipitous fall of the blood sugar, such as occurs in functional hyperinsulinism, is in part the result of an increased utilization of sugar by the tissues. Under conditions of a rapidly falling blood sugar the gradient between the concentration of sugar in blood and tissue is great and the level in the blood is likely to be considerably higher than that obtaining in the tissues. Since hypoglycemic symptoms result from too little sugar in the tissues, particularly in the cells of the central nervous system, one can understand the occasional occurrence of hypoglycemic symptoms at relatively high levels of blood sugar. Dr. Herold asked about the relation of renal glycosuria to hypoglycemia. Several cases have been seen and others have been reported in which severe grades of renal glycosuria have resulted in an inability to maintain a normal glycemia; hence, periodic hypoglycemic attacks occur. The question of why dietary carbohydrate should be reduced in the management of functional hyperinsulinism involves a fundamental element of the disturbance. Whatever the mechanism which brings it about, it is a fact that these patients respond to ingested carbohydrate with an excessive secondary hypoglycemia. In man and in animals high carbohydrate feeding increase the production of insulin while low carbohydrate feeding diminishes it. Hofmeister first observed the latter phenomenon and called it hunger diabetes. Patients with functional hyperinsulinism have much less postprandial hypoglycemia on low carbohydrate diets than on high. I believe that restriction of carbohydrate in these cases dampens the activity of excessively responsive islet cells.

TRIDIONE IN THE TREATMENT OF EPILEPSY

WILLIAM G. LENNOX, M.D.
Boston

A year ago I presented evidence [1] for the belief that pyknoepilepsy, myoclonic jerks and akinetic seizures are members of a petit mal triad, best treated by a new medicine, 3,5,5-trimethyloxazolidine-2,4-dione (Tridione). I am now able to report the results of medication in 166 patients having a petit mal type of seizure and also the results in 93 patients having psychomotor or grand mal seizures. These latter observations are timely because of reports that Tridione is an anticonvulsant, a contention which my own clinical observations do not support.

First I emphasize that the term petit mal is not used for short lived or mild seizures of any sort but is confined to three clinically distinct manifestations; first, petit mal (or pyknoepilepsy) transient but frequent lapses of consciousness; second, myoclonic jerks, and third, akinetic (loss of posture) seizures. All three seizures are usually accompanied by the alternating spike and slow wave of the electroencephalogram.

EFFECT ON PETIT MAL

The beneficial effect of Tridione on seizures of the petit mal triad is demonstrated graphically in figure 1 and in the last column of table 1. Thirty-one per cent of patients became entirely free of seizures; an additional 32 per cent have less than one-fourth the previous number; 20 per cent are improved to a lesser extent; 13 per cent are unchanged, and 4 per cent have experienced an increase in the number of attacks. Thus, of the 166 patients, 83 per cent have had fewer seizures of the petit mal type.

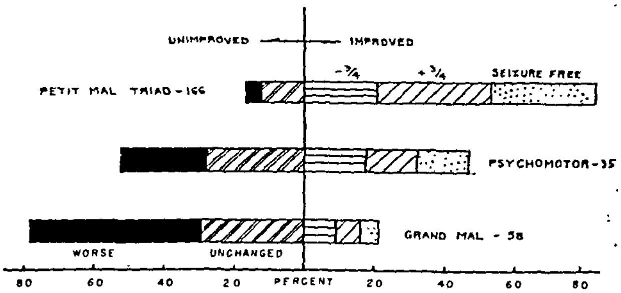

Fig. 1.—Effect of Tridione on petit mal, psychomotor and grand mal seizures. The perpendicular line separates cases which are improved, on the right, from those unimproved, on the left. Portions of the columns, from left to right, indicate the following with reference to seizures: solid, more frequent; double hatched, unchanged; horizontal lines, less than three-fourths improvement; single hatched, more than three-fourths improvement; dotted, seizure free. The figures to the right indicate the number of patients having the specified type of seizure. The abscissa measures percentages of the total.

EFFECT ON GRAND MAL

I shall report the effect of Tridione on seizures other than those of the petit mal triad and then return to an analysis of the results with petit mal. In this report, as in most medical writings, the word "convulsion" implies generalized and severe muscular contractions, in other words "grand mal."

Spielman [2] synthesized 3,5,5-trimethyloxazolidine-2,4-dione to serve as an analgesic, but Everett and Rich-

[2] Spielman, M. A.: Some Analgesia Agents Derived from Oxazolidine 2-4 Dione, J. Am. Chem. Soc. **66:** 1244, 1944.

ards[3] found that it had an anticonvulsant effect in animals superior to that of either phenobarbital or diphenylhydantoin sodium (Dilantin). Thorne[4] also hailed Tridione as an anticonvulsant for patients, but study of his data gives the opposite impression. Nine of his 11 institutionalized patients had more convulsions when taking large doses of the new drug than when taking phenobarbital or diphenylhydantoin sodium. Comparison with a medicine-free period was without value, for during this period, which followed abrupt stoppage of anticonvulsant therapy, 3 patients went into status epilepticus. Richards and Perlstein[5] and, later, Perlstein and Andelman[6] reported improvement of patients with grand mal as well as petit mal. Of 26 patients, 10 had fewer grand mal seizures while taking Tridione. From the beginning the drug has acted more as a convulsant than as an anticonvulsant in patients treated by me. Failure of a drug to produce the same results against the spontaneous convulsions of patients and the artificially induced convulsions of animals (for which relatively huge doses are given) is neither surprising nor unusual.

In the entire group of 218 patients, one half had a history of convulsions. Among these, an average duration of seven and a half years had produced a total of 443 grand mal seizures per patient, or 59 per year. In many patients grand mal occurred too infrequently for an absence of convulsions to be significant, though in such patients the reappearance of seizures with the institution of medication was considered significant.

Fifty-eight patients of all ages having grand mal seizures frequently enough to permit judgment of results were given Tridione either alone or in addition to whatever anticonvulsant the patient had been using. As shown in figure 1 and table 2, grand mal seizures are controlled in 5 per cent of patients, are at least three-fourths better in 7 per cent, somewhat improved in 9 per cent, unchanged in 29 per cent and worse in 50 per cent. In other words, results are the reverse of those obtained with petit mal; 79 per cent of patients with grand mal were not improved as compared with 83 per cent of those with petit mal improved. Of the 58 patients, 41 also had a history of petit mal seizures. Of these 41 patients who had both types, 56 per cent were worse and 14 per cent were better as far as the grand mal seizures were concerned, whereas in the smaller group of 17 patients with a history of grand mal only, 35 per cent were worse and 36 per cent were in some measure improved. Thus, the convulsant action of Tridione seems to be less in patients whose grand mal seizures are not complicated by petit mal.

Of the 29 patients who experienced an increased frequency of grand mal, 13 were given only Tridione and 16 received diphenylhydantoin sodium in addition. Of these 29, 6 had not had a convulsion for more than a year prior to starting Tridione therapy; 1 had never before experienced a grand mal seizure. In 3 instances, patients with a history of frequent seizures of the grand mal type went into status epilepticus when they were given this drug in place of previous medicaments. Two of them died. These observations discourage the use of Tridione as a treatment for grand mal. Advertisement of Tridione "for the control of the petit mal triad and other convulsive disorders" is, in my opinion, a double misstatement, for it implies that petit mal seizures are convulsions and that in human beings this drug controls convulsions. The physician must always choose the most effective of many possible remedies for his patient. *Any new drug must do more than demonstrate a positive effect; it must prove to be better than drugs of established value.*

Tridione should not be given to a patient who has only grand mal, but when petit mal seizures are complicated by grand mal, as they are in 55 per cent of the patients in this series, and the grand mal seizures recur more often than yearly, both this drug and an anticonvulsant, such as phenobarbital, N-methylphenobarbital (Mebaral), methylphenylethyl hydantoin (Mesantoin)[7] or diphenylhydantoin sodium, should be tried. Because the last named drug frequently causes an increase of petit mal, one of the other drugs mentioned is usually preferable. Of the 41 patients having both grand and petit mal seizures, 14 per cent had fewer of the grand mal type after starting Tridione therapy. A number of our patients, in spite of an initial increase of grand mal, have persisted in the use of combined medication with attainment of satisfactory results for both petit mal and grand mal. Relief or near relief from the petit mal triad was obtained in 67 per cent of patients with only petit mal and in 59 per cent of those having both petit mal and grand mal (table 1).

EFFECT ON PSYCHOMOTOR SEIZURES

The psychomotor type of seizure consists of a period of amnesia without convulsive movement other than possibly some tonic rigidity of muscles. Most experienced physicians agree with Merritt and Putnam[8] that phenobarbital is usually of little value, but that diphenylhydantoin sodium renders signal assistance in hirds of patients having this form of , De Jong[9] has stated that he has failed to relieve psychomotor epilepsy with either diphenylhydantoin sodium or Tridione alone, but in 6 patients he obtained excellent results with a combination of Tridione and phenobarbital or diphenylhydantoin sodium.

[9] De Jong, R. N.: The Effect of Tridione in the Control of Psychomotor Attacks, J. A. M. A. **130:** 565 (March 2) 1946.

Our group comprises 35 patients of all ages. The average duration of epilepsy had been 7.3 years, producing an estimated total of 1,129 psychomotor seizures per patient, or 155 per year. Some of these patients had a history of grand mal also, but in each case psychomotor seizures predominated. The results are shown in figure 1 and table 2. Five (14 per cent) of patients have been free of seizures for a significant period (one to three months); 14 per cent have had less than one fourth as many; 17 per cent are somewhat better; 29 per cent are unchanged, and 26 per cent are worse. In 13 of the 16 patients who were improved, and in 9 of the 19 who were not improved, diphenylhydantoin sodium or phenobarbital was given in addition to Tridione. This group is too small and the period of observation too short to justify definite conclusions. Tentatively, one may say that Tridione alone is ineffective in the control of psychomotor seizures but that the occasional patient will benefit from a combination of this drug and diphenylhydantoin sodium.

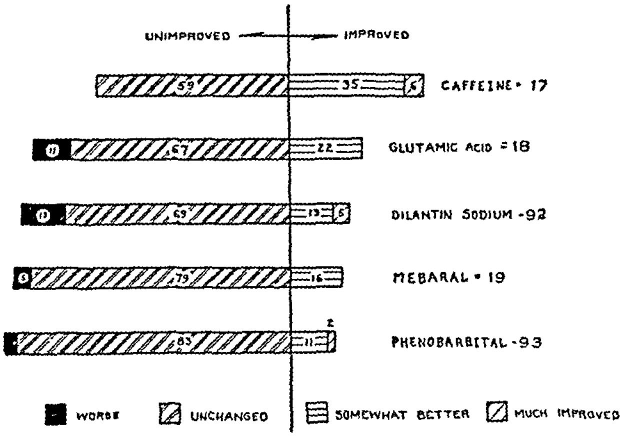

Fig 2.—Effect of previous medication on petit mal. The position of the columns and the symbols have the same significance as in figure 1. The numbers within the columns refer to percentages. The figures to the right indicate the number of patients taking the medicaments

ANALYSIS OF PETIT MAL CASES

Most interest, especially for pediatricians, attends the effect of Tridione on the petit mal triad. The results shown in table 1 are especially startling when viewed against the background of the mediocre results from the use of other medicaments (fig. 2). Naturally, none of this group of 166 patients had secured complete relief from any treatment. The proportion of patients reporting any improvement was: phenobarbital 13 per cent, diphenylhydantoin sodium 18 per cent, N-methylphenobarbital and glutamic acid, each 22 per cent, and caffeine 41 per cent. In this series the number of patients given a certain drug bore no relation to the therapeutic results. Thus, five times as many patients had been given phenobarbital as were given the more effective caffeine. Of the drugs whose use was accompanied by an increase of petit mal seizures, diphenylhydantoin sodium was first with 13 per cent and glutamic acid was second with 11 per cent. A number of other drugs were tried with 1 or more patients. Alcohol and paraldehyde proved of positive benefit in a young woman with myoclonic jerks. Methylphenylethyl hydantoin[10] was of no benefit to 11 patients. Many patients whose petit mal seizures were only partially controlled by Tridione were given phenobarbital, amphetamine sulfate or desoxyephedrine hydrochloride without substantial additional benefit.

Table 3.—*The Effect of Tridione in Petit Mal with Respect to Patient's Present Age*

	Age					
	0 to 9		10 to 19		20 and Over	
Petit Mal Triad	No	%	No	%	No	%
Entirely controlled	23	39	18	24	10	31
Three fourths controlled	14	24	31	41	9	28
Somewhat improved ..	7	25	20	27	6	19
Unimproved ..	15	12	6	8	7	22
Total .	59	100	75	100	32	100

Influence of Age.—The distribution by age of the 166 patients with petit mal was as follows: 0 to 9 years, 36 per cent; 10 to 19 years, 45 per cent; 20 and over, 19 per cent. Thus, 81 per cent of patients were under the age of 20. The proportion of those free of seizures or 75 per cent improved for these three age groups was 63, 65 and 59 per cent, suggesting that age makes little difference in the results obtained. However, on closer inspection, the extremely good and the extremely poor results are found to be concentrated in patients less than 10 years of age. Of patients in the first decade 39 per cent were freed of petit mal, against 24 per cent in the group of those aged 10 to 19. And yet, patients not helped at all formed 12 per cent of the younger group and only 8 per cent of the older. The younger group contained more children with pathologic conditions of the brain, which spoiled what otherwise would have been an extremely good record for this age group (table 3).

Influence of Type of Petit Mal.—Of the 166 patients subject to one or more of the petit mal triad, 131 (79 per cent) had petit mal (pyknoepilepsy); 38 (23 per cent) had akinetic seizures and 39 (24 per cent) had myoclonic jerks. (Some had more than one form.) Results were equally good for all three types; 63 per cent of patients with pyknoepilepsy, 64 per cent of those with akinetic seizures and 70 per cent of those with myoclonic jerks were freed of three fourths or more of their seizures.

Table 4.—*The Effect of Tridione on Pyknoepilepsy with Respect to Duration and Total Number of Seizures*

	A	B	C Average Number of Petit Mal Seizures		
Pyknoepilepsy	Number Patients	Average Years Duration	Total	Per Year	Per Day
Entirely controlled	34	4 32	26,800	6,200	17
Three fourths controlled	48	6 89	17,000	2,500	7
Somewhat improved	28	8 22	27,300	3,300	9
Unimproved	21	5 19	22,100	4,400	12
Total .	131	6 24	22,100	3,540	10

The Duration and Frequency of Petit Mal Seizures.—Akinetic and myoclonic manifestations were too inconspicuous and irregular to permit estimation of their number. Among the 131 patients who gave a history of petit mal seizures (with or without other of the petit mal triad), a rough approximation of the total number of petit mal attacks was attempted. For individual patients this number varied between a few

---

10. Lennox, W. G.: Newer Agents in the Treatment of Epilepsy, J Pediat 29: 356 (Sept) 1946.

hundred and 250,000. The period since petit mal began varied from a few months to twenty-five years. Among the 131 patients with petit mal (pyknoepilepsy) the "average" patient during six and one-fourth years had experienced a total of 22,100 petit mal seizures, approximately 3,500 a year, or ten a day. In table 4 these data have been tabulated with respect to the success of therapy. The group of patients who were completely freed of symptoms had had more petit mal seizures than had the average patient, a total of 26,800 against the average of 22,100, or seventeen a day against the average of ten a day. This group had had symptoms for only four and a third years, probably because these children were younger. This tabulation demonstrates that great frequency of pyknoepileptic seizures is no bar to therapeutic success with Tridione.

Among patients improved by treatment there seemed to be correlation between the degree of improvement and the shortness of the history of petit mal (table 4 *B*). The success in patients with a short history is presumably due to their youth rather than to the short duration of the disease. Of the patients with petit mal who were not improved by Tridione approximately one-half revealed evidence of pathologic conditions affecting the brain. For the most part these were young children, a fact which would account for the relatively short history (5.19 years) of those patients who experienced no improvement with Tridione therapy.

These 131 patients in the six and a half years had experienced a total of approximately 3 million petit mal seizures. If present results are a gage of the future, more than half these seizures can be eliminated. On the assumption that there are 100,000 patients with petit mal in the United States, and that a saving of 2,000 of the 3,500 petit mal attacks of the "average" patient (table 4) can be effected, the youth of America could be saved something like 200 million seizures of the petit mal type a year.

Influence of the Electroencephalogram.—Results of the brain wave recordings are available in 137 patients with a history of one or more forms of the petit mal triad. The electroencephalographic diagnoses were as follows: petit mal, 58 per cent; petit mal with slow or fast frequencies, 23 per cent; petit mal variant, 8 per cent; slow or fast frequencies, 7 per cent, and normal electroencephalograms, 4 per cent. Thus 89 per cent of electroencephalograms displayed the spike and wave formations of petit mal or petit mal variant. They were found with least consistency in patients with akinetic seizures. The proportion of patients clinically improved by medicaments was approximately the same for the various electroencephalographic classifications. In general disappearance of clinical petit mal was followed by a sharp reduction or disappearance of spike and wave formations from the record.

Effect of Stopping Medication.—Abrupt cessation of administration of the anticonvulsant drugs, bromide, phenobarbital or diphenylhydantoin sodium; oftentimes is followed by a flood of seizures. With Tridione weeks or months may elapse before the attacks of petit mal return. Indeed, several patients have been without medicaments and free of petit mal seizures both clinically and electroencephalographically for many months, the longest period being eighteen months.

Side Effects.—The low toxicity of 3,5,5-trimethyloxazolidine-2,4-dione and its failure to injure the visceral organs or the blood of animals has been dealt with by Richards and Everett.[11] In the use of new drugs any unusual symptom must be considered suspect. The use of Tridione is followed by unusual and puzzling symptoms, which in some patients neutralize its benefits. Data concerning side effects include statistics on patients who did not continue treatment long enough for the evaluation of therapeutic results.

Among 222 patients who reported adequately, 122 had symptoms which might conceivably be due to the drug. Of these, hemeralopia (photophobia) was by far the most frequent. Sixty-eight patients (31 per cent of those treated) reported some degree of glare when going from indoors into the brightly lighted outdoors. Because of the glare effect, objects at a distance were indistinct and colors faded. The effect diminished on continued exposure to light, but in severe cases patients were required to wear dark glasses when outdoors. The intensity of the symptom was related to the dosage of Tridione. A few patients complained of associated pain in the eyeballs, and 1, of difficulty in focusing the gaze. Photophobia commenced from a few to ten days after the start of medication and disappeared a week or two after its discontinuance. Thorough ophthalmologic examination of several severely affected patients failed to reveal any evidence of defective appearance or function of the eyes not present before medication was begun. The photophobia is as yet unexplained. Simultaneous administration of vitamin A, or of *d*-amphetamine sulfate (Dexedrine) or *d*-desoxyephedrine hydrochloride (Desoxyn), has not been distinctly beneficial. In some patients with only mild symptoms of photophobia tolerance for the drug seemed to develop. Photophobia caused discontinuance of medication in only 5 of the 222 cases. Curiously, children under 6 years of age did not seem to be affected, in spite of the fact that they received larger doses per unit of body weight than did older patients. The proportion of patients affected was 23 per cent in the first decade of life, 34 per cent in the second and 24 per cent in the group aged 20 or over.

Rash was second to photophobia in incidence (32 cases, or 14 per cent of all patients treated) but equally important in forcing the discontinuance of treatment. Unlike photophobia, rash was commoner among young children, 20 per cent in those under and 12 per cent in those over the age of 10 years. The majority of patients, but especially adolescents, complained only of a bad complexion with acne-like papules or small shotlike nodules in the skin of the forehead or face. A generalized measles-like rash appeared in 16 patients (7 per cent). They formed 15 per cent of those under but only 4 per cent of those over 10 years of age. Such a rash required immediate discontinuance of the medicament. However, in most instances, after Tridione was stopped and the rash had disappeared, medication was resumed successfully. Beginning with 0.3 Gm. of the drug a day, or on alternate days, the amount was increased by 0.3 Gm. at two week intervals until the therapeutic dose was reached. One patient had a spreading erythema multiforme with associated fever and leukopenia, which required hospitalization.

The list of unpleasant side effects in the order of their frequency in these 222 patients was as follows: photophobia 68; rash 32; gastric distress or nausea 18; difficult behavior 9; fatigue 7; muscular instability 6;

---

[11] Richards, R. K., and Everett, G. M.: Tridione: A New Anticonvulsant, paper read before the Section on Experimental Medicine of the American Medical Association, July 3, 1946.

headaches 5; insomnia, poor appetite and nervousness, 4 each; dizziness, pain in the eyes and nosebleed, 3 each; sleepiness, double vision and poor circulation, 2 each; sneezing, hiccough and aplastic anemia, 1 each. One adult who by mistake took 3.0 Gm. a day for a month experienced mild confusion, which cleared when the dosage was reduced. None had symptoms of psychosis, hypertrophy of the gums or ataxia. However, Walker [12] observed gross ataxia in several epileptic persons whose brains had been severely traumatized in the war. Against the 9 patients with difficult behavior were 20 in whom the behavior was greatly improved; and against 2 with decreased alertness were 15 who became more alert. These last were children whose petit mal and cerebral dysrhythmia had disappeared or were greatly improved.

Effect on the Blood.—In a person allergic to a drug, the blood-forming organs as well as the skin may react to that drug. Some of the most valuable drugs, for example, those of the sulfonamide group, are most troublesome in this respect. My associate Dr. Jean Davis to date has made repeated monthly examinations of the blood of 127 patients who have taken Tridione for from several months to two years. None has had significant decrease of hemoglobin, red cells or platelets. In 6 per cent of the cases the polymorphonuclear leukocytes decreased to 1,600 or less per cubic centimeter and Tridione medication was discontinued. In one fourth of the patients the eosinophils increased to from 6 to 25 per cent. In all cases the hematic picture returned to normal when use of the medicament was discontinued. In most instances medication was then resumed, but the blood was reexamined frequently. (This series of observations does not include the case of aplastic anemia mentioned under mortality.)

The incidence of allergic manifestations of the blood is no greater than such reactions with many other drugs. However, the physician should prescribe Tridione only for patients likely to benefit—those who have one of the petit mal triad. He should attend to complaints of fatigue, weakness, dizziness, pallor, sore throat, fever, coryza or edema, and he should have the blood examined at intervals, preferably monthly. The first evidence of serious trouble would be an obvious diminution in the number of platelets in the stained smear. However, a count of leukocytes below 4,000, together with polymorphonuclears less than 40 per cent, or numbering less than 1,600 are indications for at least temporary discontinuance of medication.

Mortality.—In this series of 218 patients followed for an adequate period there were 3 deaths. Two occurred during status epilepticus in patients with gross cerebral pathology. The first patient had been in status epilepticus frequently before; the second, a girl with frequent psychomotor seizures, had not been in this state previously but went into a prolonged series of convulsions a few days after Tridione was substituted for diphenylhydantoin sodium. The third patient, a girl of 16, had been taking methylphenylethyl hydantoin 0.3 to 0.4 Gm. intermittently for eleven months and Tridione 1.2 Gm. constantly for eight months; aplastic agranulocytic anemia developed, with bleeding which could not be checked. Details and observations at autopsy will be reported by the physicians in another city who attended her.[13] A second similar case is reported from Chicago.[14] In neither case had blood examinations been made. These 2 deaths due to allergic reaction to the drug from among 10,000 or more patients who have taken this medicine should not deprive patients who need it of Tridione but should encourage vigilance on the part of the attending physician.

Reasons for Stopping Treatment.—Among the 80 patients who discontinued medication with Tridione, the largest number stopped because of increased convulsive seizures or failure to control petit mal. The primary difficulty was with grand mal in 20 cases, with psychomotor seizures in 8, with petit mal in 17, and with both petit and grand mal in 4.

A rash caused discontinuance in 5 patients, all but 1 of whom had petit mal. Seven stopped because of neutropenia and 5 because of photophobia. One of these patients had secured release from petit mal of twenty years' duration, but an eye which had been blind from birth became inflamed and painful and was removed. On the resumption of Tridione therapy the remaining eye became hyperemic, and administration of the drug was stopped as a measure of precaution. Increased irritability and refusal of the child to take medicine, each caused discontinuance in 2 instances. Thus less than 10 per cent of patients had to stop treatment because of toxic complications. In addition medication was stopped in 6 patients who were free of seizures as a test of the permanence of the arrest of their disease.

Dosage.—Tridione is dispensed in capsules, each of which contains 0.3 Gm. The beginning dose for infants is 0.3 Gm.; 2 to 4 years, 0.6 Gm., and five years and above, 0.9 Gm. daily. The usual dose for adults is 0.9 to 1.2 Gm. daily. The medicament is given thrice daily with meals. In young children, the contents of a capsule may be placed in food—apple sauce, cream or cereal. If gastric distress follows ingestion a liberal quantity of fluid should be taken with the drug. If after one month seizures are not controlled the daily dose is increased by 0.3 Gm. at monthly intervals until therapeutic relief is secured, toxic symptoms appear or double the initial dose is being taken. Several patients have been free of seizures since the first dose, but maximum improvement usually occurs in from one to four weeks.

The largest period of waiting for relief and the largest dose used was for a child aged 8 who had 50 to 75 petit mal seizures a day. After six months of medication with a final maximum of 2.1 Gm. of the drug a day, and after discontinuance of diphenylhydantoin sodium, petit mal disappeared both clinically and electroencephalographically. She has been free of seizures for a year, but because of the slowness of improvement the administration of Tridione has only recently been discontinued.

An increased dose which does not result in further decrease in the number of seizures, as it may not, should not be continued. Larger amounts than those mentioned have been given by others without ill effect. Patients whose symptoms are not controlled by the usual doses have been hospitalized by Gibbs [15] and given as much as 4.5 Gm. of Tridione a day for a number of days. Seizures of petit mal stopped by these heroic amounts may not return when normal dosages are resumed. In practice, if petit mal seizures have been absent for three months and the electroencephalogram is free of dart and dome formations, the dosage of the medicament is reduced by one capsule (0.3 Gm.) every two months until none is taken or seizures return. If the brain wave tracing, made semiannually, reveals a return of petit mal formations medication is resumed. In the absence of trustworthy [illegible] examinations, dependence must [illegible] reports or on the amount of overventilation required to produce a petit mal seizure.

SUMMARY

Treatment with 3,5,5-trimethyloxazolidine-2,4-dione (Tridione) has been evaluated in 218 epileptic patients. It has proved wonderfully effective in controlling the petit mal triad: petit mal (pyknoepilepsy), myoclonic jerks or akinetic seizures. Of 166 patients who had frequent daily seizures of this type, 83 per cent were better and 31 per cent were freed of this form of seizure. The proportion of children who were freed of petit mal, but also (because of cerebral pathology) the proportion of those not helped at all, was greater for younger than for older children. Great frequency of seizures was no bar to success of treatment with this drug.

In contrast, Tridione was helpless against convulsions. Of 58 patients having frequent grand mal seizures (with or without complicating petit mal) 21 per cent had less frequent and 50 per cent had more frequent convulsions. The drug when used alone was ineffective in 35 patients having psychomotor seizures, but in a minority of cases it supplemented the therapeutic action of diphenylhydantoin sodium.

Of the various side effects, rash and hemeralopia (photophobia) were most frequent. The first was most pronounced and the second least pronounced in young children. Most serious is a possible toxic effect on the bone marrow. Monthly blood examinations with discontinuance of medication if neutrophils fall below 1,600 per cubic millimeter seems to provide adequate protection.

Use of this drug is contraindicated for patients who have convulsions (grand mal) only. It must be used circumspectly or in combination with some anticonvulsant if the patient has both petit mal and convulsive seizures. It is clearly the drug of choice in the treatment of the petit mal triad.

ADDENDUM

Recently I have learned of 3 cases of toxic amblyopia (which cleared when medication was stopped) and of 2 additional deaths from aplastic anemia (probably without preceding blood examinations).

On preliminary trial, an experimental homologue of Tridione (dimethylethyloxazolidine dione) seems to be somewhat more effective [illegible]t mal and to exhibit somewhat less [illegible] is cumulative that Tridione is not an anticonvulsant for patients.

ABSTRACT OF DISCUSSION

Dr. Meyer A. Perlstein, Chicago: When Dr. Lennox studies a subject one may be sure that it is thoroughly covered. It would be hard to duplicate a series such as he has presented, and I think that he has shown that Tridione, like taxes, is here to stay. It was gratifying to see Dr. Lennox corroborate observations I happened to make over a year and a half ago. In pediatrics one always thinks of using a new drug for conditions other than that for which it was originally intended. I wanted to mention some of the other conditions for which Tridione has been used. One of its important uses is in cerebral palsy, in which children are tense and rigid and it is often necessary to relax this rigidity or tenseness before one can attempt to train them. In children who are suffering from cerebral palsy of the extrapyramidal, or athetoid type Tridione will often be effective in relieving the tenseness. It is much more effective than phenobarbital or bromides or any other sedatives. In patients with the spastic type of palsy the drug seems to be of less benefit; apparently it has a selective action on the athetoid rather than on the spastic type of cerebral palsy. Dr. Lennox mentioned the changes in behavior incident to the administration of the drug. In some instances behavior became worse, but in several instances it improved. In some children with behavior disturbances without convulsions a decided improvement in this behavior resulted after Tridione therapy. Unfortunately, this improvement is not sustained. In other words, it is not a substitute for psychotherapy or for the removal of the causes of disturbance in behavior; but it is a good sedative, and one will often find it better than phenobarbital and bromides in these behavior disturbances. The use of Tridione against chorea proved disappointing. It was also used in cases of paralysis agitans. (Some pediatricians take care of anybody who has ever been a child.) This group of patients not only did not get better but most of them got worse. The drug was also employed in an attempt to control the convulsions of tetanus and it was quite an effective anticonvulsant in tetanus provided the patient was not one who was an alcoholic addict. For such the drug seemed to result in no benefit at all. It appears that alcoholism engenders a tolerance toward this drug such as is often seen with barbiturates and other such drugs. So far as Tridione itself is concerned, I think Dr. Lennox has pointed out that there are often failures in petit mal epilepsy. Most of the failures I have seen have been in petit mal epilepsy associated with organic disease of the brain. The best results are obtained in the so-called idiopathic form of the disease. In grand mal this drug is less effective. It is best used as an adjuvant or additional drug in those patients who have not responded to therapy with phenylhydantoin sodium or phenobarbital. If cases are divided into lesions of the pyramidal tract and of the extrapyramidal tract, in most of the former cases the patient obtains no improvement at all, whereas those with the extrapyramidal lesions do get improvement.

Dr. Richard K. Richards, North Chicago, Ill.: To my co-workers and myself who had the good fortune to discover the rather unexpected anticonvulsive action of Tridione in animals and to suggest its introduction into the field of epilepsy, it is gratifying to have such competent investigators as Drs. Lennox and Perlstein confirm that the drug has a real place in the therapeutic armamentarium. I presented an outline of the pharmacology of Tridione before another section yesterday. This drug was synthetized as an analgesic, and was found to possess analgesic properties in animals and in human beings. This is in accordance with the remark of Dr. Perlstein that the drug seems to have a subcortical point of action. Some evidence for this can be derived from his clinical experiments and from the fact that pain centers are located, at least partially, in the thalamic region. To my knowledge Tridione is the only drug which can be called both an anticonvulsant and an analgesic. Drs. Lennox and Perlstein also pointed out toxic effects which escape pharmacologic study. Dr. Lennox does not wish to describe the drug as an anticonvulsant in order not to confuse the physician into expecting anti-grand mal action from Tridione. I think his evidence and that of other investigators strongly indicates that the drug should not be used in grand mal alone without other medication. However, the fact that Tridione possesses anticonvulsive effect has been evident by its action against clinical tetanus and its effectiveness in status epilepticus by intravenous injection. In this last indication it has been used successfully by such competent observers as Drs. Erickson and Masten in Madison, Wis., and Dr. Thorne in Brandon, Vt. The toxicity of Tridione in animals and human beings is extremely low. It possesses little if any effect on circulation and respiration in doses which are effective against convulsions or as an analgesic.

Clinical Notes, Suggestions and New Instruments

SPONTANEOUS RUPTURE OF THE SPLEEN DUE TO INFECTIOUS MONONUCLEOSIS

JAMES M. SULLIVAN, M.D.
and
SIDNEY E. WASSERMAN, M.D.
Wood, Wis.

Infectious mononucleosis may sometimes be difficult to diagnose because of the vague and protean symptomatology which it presents. It may also be the cause on extremely infrequent occasions of a grave complication such as spontaneous rupture of the spleen. Because of more accurate hematologic studies, infectious mononucleosis as a disease entity is now being diagnosed more frequently and accurately than heretofore. Therefore, all complications which occur with the disease should be watched for carefully. Spontaneous rupture of the spleen should not be overlooked if the patient has abdominal symptoms which may be diagnostic of such an occurrence, especially since rupture of the spleen can terminate fatally. This case is being reported so that such spontaneous rupture may not go undiagnosed when symptoms present themselves. That this is a rare complication of infectious mononucleosis can be attested by the literature, in which only 12 cases have been reported to date,[1] 7 of which had just recently been reported by Smith and Custer[2] in the July 1946 issue of *Blood*. This case is, therefore, being reported so as to add to the literature all available instances of this rare complication.

REPORT OF A CASE

A white man aged 25, single, a commercial artist, entered the hospital for the first time on June 16, 1946. The patient stated that two weeks prior to the onset of this disease he noticed headache and some malaise. Prior to this for about six months he noticed the loss of 50 pounds (23 Kg.), the development of weakness and upper abdominal pain which was relieved by taking broth and staying in bed. Three days prior to admission there developed a sore throat and about one day prior to admission to the hospital there developed fever and over the left upper abdominal quadrant severe pains, which were worse with deep breathing. He had been coughing a great deal and this aggravated the pain. The chief complaint on entering the hospital was abdominal distress, fever, sore throat and pains in the left upper abdominal quadrant. Examination revealed an acutely ill white man, well nourished, with normal muscular development. The temperature was 99.2 F., the pulse rate 94, the respiratory rate 22. Examination of the nose, throat and mouth revealed some enlarged, red tonsils and a redness of the posterior pharyngeal wall, but no membranes were noted. The cardiovascular system was essentially normal. No abnormalities were noted in the respiratory system except depressed breath sounds in the left lower part of the chest. No lymphadenopathies were noted. There was extreme tenderness over the tenth to the twelfth rib posteriorly and over the seventh rib on the left side anteriorly. No palpable masses were felt. Examination of the blood on June 17, 1946 revealed a total of 3,900,000 erythrocytes and 9,900 leukocytes, with a differential count as follows: polymorphonuclear leukocyte, 55 per cent; lymphocytes, 45 per cent, and monocytes, 1 per cent. The hemoglobin was 68 per cent and the color index was 0.87. The urinalysis performed on the same day was essentially negative, and the complement fixation test and the precipitation test for syphilis were negative. A presumptive diagnosis of diphtheria was made at this time, and the patient was isolated for treatment. The patient was seen again on the following day, at which time it was decided that he did not have any evidence of diphtheria. However, he was still complaining of severe pain in the left lumbar region, which continued to be aggravated by deep breathing. He stated that on June 14, which was two days prior to his admission to the hospital, he suffered agonizing pain in the left upper abdominal quadrant and then fainted. He gave no history of malaria or trauma. On June 19 examination of the lungs revealed impaired resonance posteriorly over the left side of the chest below the eighth rib, with absence of sounds and tactile fremitus in this area. The left base posteriorly lagged in expansion. Examination of the abdomen at this time revealed tenderness and rigidity in the left upper abdominal quadrant and left lumbar region. The liver and spleen were not palpable. There was pain in the left shoulder. A splenectomy was performed on June 20, 1946 with the following notation as to gross observations: The abdomen contained about 1,500 cc. of free blood. Two lacerations of the spleen were present, one located on the central portion and one on the lower pole. There were some subcapsular hemorrhages. The spleen was about three times the normal size and was friable. The postoperative convalescence was somewhat stormy, complicated by the development of fluid within the left side of the chest.[3] Postoperative treatment consisted chiefly of the administration of heparin and Dicumarol (3,3′-methylene-bis-[4-hydroxycoumarin]) for the prevention of thrombi in the splenic vessels, which may be an extremely discomforting complication of this disease. Also repeated aspirations of the chest were performed for the removal of fluid. The prothrombin level was watched closely during the administration of Dicumarol and heparin, and these levels were used as an index in the administration of the anticoagulant therapy. The fluid removed from the chest was sterile in smear and culture and contained about 60 lymphocytes per centimeter. The heterophil antibody test was positive at one time, being 1:248, and the Davidsohn absorption test revealed that not more than three fourths of the heterophil antibody was removed by guinea pig kidney antigen absorption. This is considered confirmatory evidence for the presence of infectious mononucleosis. The leukocyte-lymphocyte ratio is not particularly characteristic. However, the characteristic abnormal mononuclear cell was found on frequent occasions, as shown in the accompanying table.

PATHOLOGIC REPORT

The spleen weighed 695 Gm. and measured 8.5 by 5.5 cm. The vessels of the hilus were small. Only small stumps were shown with no arterial sclerosis or thrombosis in the arteries.

From the Veterans Hospital, Wood, Wis., and the Marquette University School of Medicine.

The vein was collapsed and contained no thrombosis. The capsule was dark red, thin, transparent and smooth on the hilar or mesial surface. This capsule was also firm and closely adherent to the stroma. On the diaphragmatic surface there was a loose, redundant, dark red, pliable capsular membrane over the major portion of this surface with an absence of the capsule close to one pole. In this latter area shreds of capsule adhered to a blackish red blood clot. There were no other discolorations in the subcapsular area or in the adjacent stroma except as indicated later. There was a recent black-red thrombus adherent to the spleen. On section, the loosened capsule was found to cover a partially firm, blackish red clot, which was 1 to 1.5 cm. thick. Beneath it the stroma was light reddish brown, firm, homogeneous and smooth, with lymphoid follicles visible grossly. The blood vessels in the stroma were unaltered. At the upper pole, where the thrombus was not adherent at all, there was a solution of the spleen involving the capsule for a distance of about 4.5 cm. and extending into a softened area about 1 cm. deep. The stroma was darker red and relatively soft. At the upper pole there was definite dark reddish softening along the mesial aspect in an area 5 by 3.4 cm. No thrombus of the veins in this area and no gross alteration or enlargement of arteries were noted. The subcapsular clot had an approximate weight of 150 Gm. The weight of the spleen 545 Gm. The diagnosis was subcapsular hematoma with rupture of an enlarged spleen.

MICROSCOPIC EXAMINATION

A section taken through the hematoma showed an organizing blood clot which on the margin was subcapsular in location. Near the hemorrhage into the capsule there was an infiltration of cells, comprising polymorphonuclears, fibroblasts and large, pale, round cells. The pulp was extremely cellular. The malpighian follicles were conspicuous, although not particularly enlarged. The germinal centers showed no activity. The white pulp revealed a striking uniformity of cellularity. A large cell in which the nuclei were either rounded, kidney-shaped or elliptic with pale cytoplasm was the conspicuous and predominating cell. These cells were found within the splenic cords, along the endothelial layer of the sinusoids and within the sinusoids proper. The latter were compressed and almost indistinguishable from the cords, particularly because of the uniformity of each component cell. Eosinophilic cells were increased in number. The trabecular veins showed a decided metaplasia of endothelial cells to cells similar to those found in the cords and sinusoids. Within the lumen of these veins there were collections of similar cells. There were no dilated sinusoids, no thrombi, and no areas of infarction. The diagnosis was hyperplasia compatible with infectious mononucleosis.

SUMMARY AND COMMENT

An additional case of spontaneous rupture of the spleen occurring in a case of infectious mononucleosis is reported. The diagnosis of infectious mononucleosis was not arrived at until after the rupture, when a review of the history of sore throat, malaise, fever and pain in the left upper quadrant of the abdomen suggested the cause and a positive heterophil reaction confirmed the diagnosis. The Davidsohn absorption test was performed in conjunction with the heterophil test because this patient had received diphtheria antitoxin at the onset of his illness, and diphtheria antitoxin could also give a positive heterophil reaction. The laboratory findings were not too characteristic as far as the polymorphonuclear, lymphocyte ratio is concerned, although the characteristic mononuclear cell was found.

The pathologic specimen conformed with the findings of others in that the spleen was enlarged, soft and friable and microscopically presented a cellular infiltration of the capsule, trabeculae, sinusoids and follicles—the entire architectural structure was blurred. The characteristic mononuclear cells were found throughout the stained tissue.

Diagnosis of rupture of the spleen is not difficult if it is kept in mind. Pain in the upper left quadrant of the abdomen, shifting dulness and pain referred to the left shoulder blade are all symptoms which suggest the spleen as the etiologic agent. In the course of malaria or infectious mononucleosis, however, it has been our experience that perisplenitis will give all these symptoms except shifting dulness; therefore, some evidence of bleeding must be awaited for confirmation of the rupture. A falling hematocrit reading or blood count in the presence of these other symptoms is sufficient to warrant an exploration.

CONCLUSIONS

1. Spontaneous rupture of the spleen may occur in infectious mononucleosis.

2. The heterophil reaction may be affected by diphtheria antitoxin, and therefore the Davidsohn absorption test should be combined with the heterophil test to make an accurate diagnosis.

3. Patients presenting symptoms of left upper abdominal pain in whom a diagnosis of acute infectious mononucleosis has been made should be observed for rupture of the spleen.

4. Operative intervention should not be undertaken until definite signs of bleeding are present.

5. Pleurisy with effusion is a common complication of spontaneous rupture of the spleen due to infectious mononucleosis, probably because of perisplenitis, diaphragmatitis and pleuritis.

Council on Physical Medicine

The Council on Physical Medicine has authorized publication of the following report. Howard A. Carter, *Secretary.*

GLASDOWN PILLOWS ACCEPTABLE

Manufacturer: Glasdown Corporation, Wilkes-Barre, Pa.

Glasdown Pillows are filled with microscopically fine fibers of glass (Owens Corning Fiberglas Corporation). Glass fibers are inorganic. Hence the pillows are recommended for relief of persons sensitive to feather dust or to the disintegration or deterioration of products of other organic materials used to fill pillows. The fibers are lightly bonded with a combination of phenolformaldehyde and silicon resins to provide consistency of pack and ease of handling.

Repeated use of the pillows apparently will not cause the fine fibers to penetrate the pillow ticking, and evidence has been submitted to substantiate this claim. In the test a bowling ball 8 inches in diameter weighing 16½ pounds was repeatedly dropped on the pillow under observation. The testing apparatus was so arranged that approximately twenty seconds elapsed between impacts of the bowling ball to allow the pillow to recover essentially its original shape. The pillow was crushed 50,000 times in this manner. Periodic examinations of the pillow during the running of the test disclosed that no fiber penetrated the pillow ticking and no fiber was found in the pillow slip. Indentation in the pillow resulted where the bowling ball came in contact with the pillow but was removed by kneading and "fluffing" the pillow. Examination at the conclusion of the test showed the pillow to be in good condition after 50,000 crushings. The pillow ticking was cut open to allow additional examination of the fibers. The fibers did not break down during the test. The density of the fibers is 0.6 pound per cubic foot and the average diameter of each fiber is 0.00008 inch.

Glasdown Pillow.

Examination by the Council confirmed the results of the investigation and the evidence submitted by the firm. The fact that the fibers did not break down precluded the possibility of air borne glass being formed and expelled when the pillows are in use.

The Council on Physical Medicine voted to accept the Glasdown Pillows for inclusion in its list of accepted devices.

THE TEACHING OF NUTRITION—III

The ability of animals to withstand the stress and strain of pregnancy and produce healthy offspring depends in large measure on the type of food consumed during the antepartum period. The offspring's ability to grow and resist infection is influenced by the food consumed during the antepartum period. Moreover, specific congenital malformations can be produced almost at will by feeding diets deficient in certain essential nutrients.[1]

Until recently little attention has been paid to the role of nutrition in the pregnant woman, probably because our medical training has been concentrated on the study of definite clinical entities rather than on the state of health of the individual patient. While investigation in recent years has shown that gross deficiency diseases are usually the result of a severe lack of certain nutrients, even a relatively slight food deficiency, particularly during periods of stress, can disturb the normal metabolism of the body, with resultant impairment in health.

Studies[2] have been reported which demonstrate the striking effect of the food intake during the antepartum period on the health of both the mother and the offspring. Pregnant women on a diet that supplied less than the recommended amounts of the essential nutrients[3] had more complications, such as anemia, severe vomiting, preeclampsia and eclampsia, miscarriage, stillbirth, accidental hemorrhage and primary uterine inertia than women receiving what is considered an adequate diet. The duration of labor was longer and complications were encountered more frequently not only during the antepartum period but also during both labor and convalescence. The ability of the mother to nurse her infant was influenced by the antepartum diet.

What may at first glance resemble a "fairy story" are the reports of the effect of the antepartum diet on the health of the offspring. Women who received a poor diet compared with those on an adequate diet had a greater number of stillbirths and prematurely born infants. The number of illnesses and deaths during the first few months after birth was much greater in infants born of mothers who had a poor antepartum diet than in the offspring of those who had received the recommended diet. These observations simply confirm what every one interested in animal husbandry has known for years; namely, that the health of the offspring is affected by the nutritional adequacy of the food eaten before the offspring is born.

During the past thirty years pediatric care has improved, with a striking reduction in the infant mortality rate. However, the reduction in the neonatal mortality rate has not been nearly so ample. For instance, in the city of Toronto the mortality rate for infants over 1 month of age and under 1 year of age dropped from 63 per thousand in 1915 to 9 per thousand in 1945, while the mortality rate for the first month of life dropped only from 46 per thousand in 1915 to 23 per thousand in 1945. Thus in 1945 no less than 72 per cent of all deaths in the first year of life occurred during the first month of life.

The importance of incorporating the study of nutritional requirements during pregnancy into the teaching curriculum of the medical student is obvious. In most medical schools the fundamental principles of nutrition are first taught in the early years of the course in the departments of biochemistry and physiology. In lectures the students are told about the essential nutrients, such as amino acids, carbohydrates, fats, minerals and various vitamins and the part played by these nutrients in the normal metabolism of the body. However, the student usually has little idea how this information is to be applied in the practice of medicine. There is need for closer correlation of this preclinical teaching of nutrition and the teaching of its practical application. The student's interest in nutrition can be increased by incorporating in the early part of the medical course lectures given by clinicians. The practical importance of nutrition in obstetric practice could here be emphasized.

Most of the teaching on nutrition in obstetric practice should be done in the antepartum clinic and the lying-in hospital. Here the obstetrician can draw attention to the importance of adequate nutrition. Practical instruction on nutrition in obstetric practice should be just as much a part of obstetric teaching as instruction on routine urine examinations, blood pressure records and pelvic measurements. It can be demonstrated how easily and how frequently, even in the best fed areas of the country, pregnant women take diets low in the essential nutrients, particularly protein, calcium, iron and ascorbic acid. Also at the antepartum clinic practical instruction on nutrition can be given to the medical student by the obstetrician and the dietitian. He can be taught how to translate the patient's requirements for the essential nutrients into amounts of ordinary foods and, with a minimum of time and effort, check the nutritional adequacy of the diet by estimating the daily consumption of milk, meat, eggs, vegetables, fruits, whole grain cereals and vitamin D. The application of this knowledge in the practice of medicine is important not only for the patient but also for future generations.

THE METABOLISM OF TRYPTOPHAN

Certain amino acids, including tryptophan, are essential for the growth of young animals and for maintenance in the adult. The necessity for the essential amino acids is not limited to protein for formation of new tissue; the metabolic use of methionine for detoxication and for the formation of such physiologically important substances as choline and creatine exemplifies this fact. Current experimental studies reveal metabolic functions of comparable importance for tryptophan.

Support for the view that the daily requirement for tryptophan may reflect other physiologic functions than formation of tissue protein is found in a recent observation in adult human subjects[1] that only approximately 1 per cent of ingested tryptophan from dietary proteins appears in the urine as such. Since the fecal loss should be small according to the available evidence, a large part of ingested tryptophan must be accounted for by some other disposition. A portion of ingested tryptophan is metabolized to undetermined end products by way of such intermediates as kynurenine and kynurenic acid. Pyridoxine appears to be involved in the metabolic breakdown of tryptophan since, in experimental pyridoxine deficiency, intermediate degradation products, such as xanthurenic acid,[2] appear in the urine.

Recent studies indicate a further pathway in the metabolism of tryptophan, this one being of immediate practical importance. In 1945 a group of workers at the University of Wisconsin[3] reported that rats fed a "pellagragenic diet" containing corn grits showed poor growth and that this was counteracted by either niacin or tryptophan. This striking observation was soon verified by other workers, who succeeded in demonstrating in addition that niacin derivatives were excreted in the urine in increased amounts.[4] Current studies[5] have now confirmed the foregoing work in human subjects. The oral administration of tryptophan produced a prompt and distinct increase in the content of niacin derivative in the urine, thus indicating that some niacin can be synthesized in the body from tryptophan. This conversion explains the puzzling observation of Goldberger and his associates[6] some twenty-five years ago that an increase of the protein allowance of pellagrins brought about an improvement in their condition. In the light of the recent experiments, some of the tryptophan from the additional dietary protein was converted to niacin, thus partially satisfying the niacin requirement of the pellagrous patients and bringing about the observed improvement in their clinical condition. Apparently, however, the human subject is unable to synthesize a sufficient amount of niacin from tryptophan to satisfy completely the daily need. This additional amount, some 12 to 20 mg., must still be provided as the preformed vitamin in the food.

SENATOR SMITH OF NEW JERSEY AND MEDICINE

As a part of the celebration of its one hundredth anniversary the New York Academy of Medicine presented a series of lectures on the relation of health to government and medicine. Dr. Haven Emerson delivered the Herman Biggs Memorial Lecture on "The Hospital Survey and Construction Act and a Nationwide Health Program," and an address was made on "Government and Medicine" by the Honorable H. Alexander Smith of New Jersey. The medical profession of the United States is fortunate in the election of Mr. Smith to the Senate; his father was a physician, a member of the New York Academy of Medicine. In his presentation, Senator Smith stated his credo relative to proposed legislation affecting the medical profession. He indicated his support of the establishment of a National Science Foundation; he endorsed the view that education in the professions can best be left to the institutions of learning, which have long carried this responsibility. He expressed considerable doubt of the value of subsidies to encourage students and endorsed the statement of Dr. Haven Emerson that "it is not at all certain or clear from past experience that paying students to be educated . . . by public subsidy is the best way of securing the highest quality of candidates."

[6] Goldberger, Joseph, and Tanner, W. F.: Public Health Rep. **37:** 462 (March 3) 1922; **39:** 87 (Jan. 18) 1924.

Senator Smith called attention to the fact that the election in the fall of 1946 shifted the "center of political gravity." "We as a party," he said, "favor the decentralization of responsibility and a plan which contemplates grants-in-aid to the several states in order that they may solve their own problems and act as experimental laboratories in the overall health field."

Senator Smith opposed the philosophic foundation on which the Wagner-Murray-Dingell bill was built. He said:

> Obviously such a measure would be revolutionary in this health field and if it was adopted all at once it might take us over many difficult bridges which would be burned behind us. It is the kind of approach that the so-called "planners" have in mind—a blueprint laid down by the few which must be accepted by the many, a blueprint not made by the trial and error method, but thought through theoretically only, ignoring the trial and error method of building an experience.

Senator Smith also analyzed the Taft-Ball-Donnell-Smith bill and contrasted it with the Wagner-Murray-Dingell bill. He said:

> The Wagner-Murray-Dingell bill calls for compulsion by government, whether federal and state, or federal alone or state alone, whereas the Ball-Taft-Donnell-Smith bill calls for freedom of action by state and local governments, by health and medical professions and by individuals. Our bill has the approach of freedom. As I said before, it aids and encourages but it does not compel. It does not contain rash promises to provide health and medical services for the entire population. In fact it is based on the theory that the vast majority of people would prefer to make their own arrangements for hospital, medical and dental care. The bill, we sincerely hope, will lead to an improvement in the quantity and quality of specified services that will be available to persons having small incomes. It should aid in bringing about a better distribution of services in rural areas through some form of public subsidy to doctors, dentists, nurses and other health personnel in such areas.

Indeed the whole theory of this approach to the health problem of the nation is expressed in a single statement by Senator Smith: "Fundamentally we believe it is wiser to aid the relatively few who need our aid, rather than to coerce the many."

The medical profession, as has already been said, is fortunate by the presence in the United States Senate of one who is familiar with the medical point of view. "The big issue," Senator Smith said, "is between federal paternalism with its overall plan and, on the other hand, federal study and assistance with the maximum of freedom to our various sovereign states to work out their own programs by the trial and error method." The philosophy which caused Senator Smith to arrive at this belief was expressed in his concluding sentence: "No one could have lived as I lived in the environment of my father's home and have seen the service he was rendering to humanity without becoming acutely conscious of the difference between the attitude toward life of those who, on the one hand, are seeking only their own selfish ends, and those who are dedicating their lives, as you all are, to the service of humanity."

Current Comment

FATAL AUDIOGENIC SEIZURES IN MICE

The term "audiogenic seizure" is employed for a pattern of behavior in rats and mice which is produced by auditory stimulation, such as an air blast, Galton whistle or the jingling of keys. The seizure is characterized by frenzied running, terminating in convulsions. In a report on this subject by Hall[1] audiogenic seizures were observed in mice following ringing of a bell inside a wash tub. Two strains of inbred mice were observed with great differences in reaction between the strains. Two mice of the more highly reactive strain died following the production of convulsions by auditory stimuli. Evidence that susceptibility to audiogenic seizures is inheritable had been previously compiled. Hall's experiments, however, appear to be the first in which lethal effects were observed from auditory stimulation. The suggested possibility that there may be a wide variation in inherent susceptibility to noise in human beings warrants investigation.

PHYSICAL STANDARDS FOR PILOTS

The Journal has commented previously on the failure of the Civilian Aeronautics Administration to have its physical examinations conducted by competent physicians. The *Journal of Aviation Medicine* points out that the department ruled that osteopaths could make these examinations a few years ago and now examinations are being accepted even from chiropractors. How many of the persons who observe air transport realize that this is the type of protection afforded by the government agency? When one contrasts the kind of education given to low grade nonmedical healers with the type of examination made by specialists who are really competent in examining the eyes, the ears and the other special senses on which safe flying so greatly depends, the folly of accepting examinations by the incompetent becomes clearly apparent. The *Journal of Aviation Medicine* points out that the bars have not thus far been lowered in the case of commercial and airline pilots, but the tendency to depreciate the quality of the examination makes the hazard of such lowering imminent. Surely here is a responsibility that the administrator cannot dodge.

REPORTS OF OFFICERS

NOTE.—At the 1925 session of the Association, the House of Delegates suggested that all reports of officers, committees, etc., and resolutions to be brought before the House, if available, be published in advance of the session so as to permit careful consideration and discussion.—Ed.

REPORT OF THE SECRETARY

To the Members of the House of Delegates of the American Medical Association:

The following report of the Secretary is respectfully submitted:

MEMBERSHIP

Each year brings a steady growth in the number of members of the American Medical Association. On April 1, 1946 the membership roster contained 126,835 names. During the ensuing twelve months the names of 5,389 new members were added, so that on April 1, 1947 the number of members was 132,224, the largest ever recorded. It is interesting to note in this centennial year of the Association's existence that the "Catalogue of Permanent Members" recorded in 1847 contained the names of 426 physicians!

FELLOWSHIP

The Fellowship roster on April 1, 1947 contained 72,888 names, as compared with 68,366 on the corresponding date in the preceding year. The reduction which occurred during the war years has been largely restored. From April 1, 1946 to April 1, 1947 the deaths of 778 Fellows were recorded, the names of 92 were dropped for nonpayment of dues and 711 resigned for various reasons.

The accompanying table shows the organization of the constituent state and territorial medical associations as of April 1, 1947.

CONFERENCE OF STATE SECRETARIES AND EDITORS

The regular annual Conference of State Secretaries and Editors was held in Chicago on Dec. 7 and 8, 1946. Attendance was exceptionally large, owing probably to the fact that the conference took place on the two days just preceding the supplemental session of the House of Delegates.

The secretaries of all constituent state medical associations and the editors of all state society operated medical journals are invited to attend this conference, and nearly all of them do so. In the past several years many other officers of the state associations and officials of many component county medical societies have been present. A new method of arranging the program was tried out for the December conference and proved acceptable to the members. By this arrangement a committee appointed at the previous conference by the chairman, who is elected from the floor each year, is charged with the duty of preparing the program as to subjects to be discussed and of suggesting desired speakers. The conference is always held at Association headquarters in Chicago.

COMMITTEE TO STUDY REVISION OF THE CONSTITUTION AND BY-LAWS

At the annual session of the House of Delegates in 1946 a committee was appointed to study and recommend revision of the Constitution and By-Laws. This committee has had several meetings and made a preliminary report to the House at its 1946 supplemental session. It is expected that the final report will be made at the Atlantic City session.

RESOLUTION ON ESTABLISHMENT OF GENERAL PRACTICE SECTIONS IN APPROVED HOSPITALS

The House of Delegates at its Supplemental Session in December 1946 adopted a resolution recommending that hospitals be encouraged to establish general practitioner services and directing that copies of the resolution be sent to the American College of Surgeons, the American College of Physicians, the American Hospital Association, the Protestant Hospital Association, the Catholic Hospital Association and every hospital in the country. Since no specific mention was made as to the body which should undertake this effort, the Secretary referred it to the Council on Medical Education and Hospitals for action. It is understood that the Council has complied with the recommendations contained in the resolution.

Resolutions and Memorials

In accordance with the action of the House of Delegates at San Francisco, the Secretary requested the secretaries of all constituent associations to send to his office, as far in advance of the meeting of the House of Delegates as possible, all resolutions adopted by those associations which require the attention of the House. Two such resolutions have been received from the Executive Secretary of the Colorado State Medical Society, and are as follows:

RESOLUTION ON CLARIFICATION OF RULES RELATING TO MEDICAL SERVICE FEES RECEIVED FROM THE FEDERAL GOVERNMENT

Whereas, Many members of the American Medical Association are now being remunerated financially by various branches of the Federal Government as the result of pension rights or retirement pay from the Army or Navy and for services rendered as Veterans Administration Consultants, teachers in Veterans Administration Institutions, experts in Federal Compensation cases or as participants in "Hometown Care Plans"; and

Whereas, Much confusion now prevails regarding the numerous rules, regulations and directives of the various branches, bureaus, agencies and commissions of the Federal Government; and

Whereas, The receipt of income from one branch of the Federal Government would seem, in certain instances, to preclude the acceptance of fees from other branches of government, therefore be it

Resolved, That the House of Delegates of the American Medical Association instruct the editor of The Journal of the Association and the Bureau of Legal Medicine and Legislation to collect, annotate, analyze, interpret and publish a digest of all the rules and regulations of the Federal Government pertaining to medical practice and medical service fees.

RESOLUTION ON CHANGE OF POLICY OF AMERICAN SPECIALTY BOARDS

Whereas, Certain of the American specialty boards not only refuse to grant credit for experience and training acquired in the field of general practice but have also recently announced discontinuance of their former practice of according credit for preceptorships with a certified diplomate and have ruled instead that every applicant for certification must serve a lengthy residency following his internship, and

Whereas, This recent change in policy constitutes an unfair imposition on many returned medical veterans and other young physicians who find it impossible to obtain such residencies, and

Whereas, Doctors entering the various specialties without any experience or training in the field of general practice find it difficult, if not impossible, to develop a broad overall understanding of the field of medicine as a whole, and

Whereas, General practice offers unique opportunities for the development of individual initiative, self reliance, personality development and professional growth, and

Whereas, It is the opinion of the American Medical Association that general practice and preceptorships are two of the best methods of teaching the art of medicine, and

Whereas, Qualified and experienced preceptors already certified by these boards are available in all parts of the United States, and

Whereas, The art of medicine is frequently neglected in hospital residencies owing to overemphasis on the science of medicine, therefore be it

Resolved, That the House of Delegates of the American Medical Association requests the Advisory Board for Medical Specialties and the several American specialty boards to review and reconsider their policies in relation to general practice, residencies and preceptorships in accordance with the foregoing statements.

Field Activity

The Secretary has tried during the past year to attend as many annual meetings of constituent state medical associations as possible. This has necessitated absence from the office for several days at a time, so that correspondence sometimes has been somewhat delayed. It is thought, however, that the best interests of the Association are served by personal contact with the constituent associations.

In Appreciation

The Secretary wishes to express his appreciation for the assistance given him by the officers and members of official bodies of the Association. The directing heads of councils, bureaus and departments and the personnel at the headquarters offices are deserving of praise for loyal contributions to the successful administration of the Association's affairs

Respectfully submitted,
George F. Lull, Secretary.

REPORT OF THE BOARD OF TRUSTEES

To the members of the House of Delegates of the American Medical Association:

The following annual report of the Board of Trustees is respectfully submitted to the House of Delegates. The activities of the various councils, bureaus and departments of the Association during 1946 and a part of 1947 are covered in this report.

Resignation of President-Elect

Under date of March 18, 1947 Dr. Olin West tendered his resignation as President-Elect of the American Medical Association. It is fitting that the members of the House of Delegates, by whose unanimous vote Dr. West became President-Elect at the San Francisco session in July 1946, should have before them his letter of resignation.

Dr. R. L. Sensenich
Chairman, Board of Trustees
American Medical Association

My dear Doctor Sensenich:

Because of continued and possibly permanent impairment of health, I feel compelled to submit to the Board of Trustees, through you as its Chairman, my resignation as President-Elect of the American Medical Association, to take effect immediately.

I take this step with the greatest possible regret, because of having been signally honored by the action of the House of Delegates in electing me to this high office, as well as because of my devotion to the Association and to its ideals. It has been my most earnest desire and my strongest intention to do all that I could do to promote the great cause that the Association has served so well for nearly one hundred years. I sincerely hope that even as an humble member in the ranks I can make some small contribution toward the success of the very worthy aims of our great society.

I am now firmly convinced that I cannot properly perform the duties of the President-Elect and, later, those imposed on the President and that, in all fairness to the Association, my resignation should be submitted and officially accepted.

It now seems probable that I shall not be able to attend the Centennial Session to be held in Atlantic City, in which case I hope you, as Chairman of the Board of Trustees, will present my apologies for my failure in office. I hope that the House of Delegates will believe that "the spirit was willing but the flesh was weak."

I have an abiding faith in the A. M. A. and in the sincerity, integrity and soundness of judgment of those who have served and now are serving as members of its official bodies. May the richest of blessings come to all of them!

Very truly yours,
Olin West.

It was with the greatest regret that the Board, by mail vote, accepted Dr. West's resignation.

Under the provisions of the Constitution and By-Laws, Dr. Edward L. Bortz of Philadelphia, Vice President, succeeded Dr. West as President-Elect and will be inaugurated as President at the Atlantic City session.

Income and Expenditures

The official reports of the Treasurer and of the Association's auditors are appended as a part of this report.

In 1946 the net income of the Association amounted to $106,368 33, as compared with $990,708 81 in 1945, a difference of $884,340 48

During the past year the cost of both material and personnel service has increased enormously. The accompanying tabulations show the more important items, together with the increase in cost over the previous year.

The budgets submitted by the various councils and bureaus for the year 1947 were given very careful consideration by the Board of Trustees. The budgets had to be reduced to a point in keeping with estimated income. During the past several years, new projects have been instituted which continue to grow, and their growth naturally is accompanied with additional expense. The submitted budgets for some of these activities, motivated by actions of the House of Delegates, are as follows:

	Submitted Budget for 1947
Bureau of Medical Economic Research	$127,380.00
Department of Public Relations	122,088.00
Committee on Rural Medical Service *‡	2,838.57
Committee on National Emergency Medical Service *	10,857.61
Council on Medical Service, including Washington office	134,265.00
Bureau of Information	21,225.00
Total	$418,654.18

* No budget. Figures are 1946 expenditures.

‡ Includes work done in Bureau of Information.

The Journal of the American Medical Association

The Journal of the American Medical Association has continued to gain in circulation, advertising and prestige. As a contribution to the celebration of the centennial, The Journal published serially a "History of the American Medical Association." Following the end of the war the foreign correspondence has been extended so that The Journal now has its own regular correspondents in London, Paris, Rome, Naples, Madrid, Geneva, Brussels, Amsterdam, Copenhagen, Oslo, Stockholm, Moscow and Ankara and also in Australia, Tokyo, Mexico City, Puerto Rico, Rio de Janeiro, São Paulo, Buenos Aires, Santiago (Chile) and La Paz (Bolivia). For coverage from the nation's capital The Journal maintains a regular correspondent, and a weekly letter referring to news from Washington is published in The Journal.

As new departments and bureaus have developed in the headquarters office, it has become necessary to provide space for their interests in THE JOURNAL. The demand for space has been far beyond the available paper supply, so that it became necessary to diminish somewhat the space allotted to original scientific articles. It is hoped that more paper may become available in the near future, since THE JOURNAL must now reject almost 80 per cent of all manuscripts submitted for publication, many of them simply on account of lack of space.

The special issues during each year include educational, hospital, state board (licensure), annual session and industrial health numbers, as well as three index numbers.

TABLE 2.—*Percentage of Physicians Receiving The Journal* *

State	Number Receiving Journal	Physicians in A. M. Directory	Approximate Percentage Receiving Journal
Alabama	1,061	2,123	50
Arizona	485	615	77
Arkansas	702	1,806	39
California	10,478	12,365	85
Colorado	1,101	1,886	58
Connecticut	2,066	2,720	76
Delaware	259	360	72
District of Columbia	1,741	4,540	38
Florida	1,673	2,391	70
Georgia	1,383	2,814	49
Idaho	244	446	55
Illinois	8,576	12,548	68
Indiana	2,622	4,165	63
Iowa	1,631	3,102	54
Kansas	1,246	2,042	61
Kentucky	1,241	2,717	46
Louisiana	1,402	2,601	54
Maine	542	1,011	54
Maryland	2,166	3,085	70
Massachusetts	5,182	8,085	64
Michigan	4,325	6,509	66
Minnesota	2,352	3,614	65
Mississippi	580	1,525	38
Missouri	2,966	5,183	57
Montana	327	556	59
Nebraska	987	1,637	60
Nevada	123	174	71
New Hampshire	391	687	57
New Jersey	4,439	6,008	74
New Mexico	320	447	72
New York	19,238	27,928	69
North Carolina	1,741	2,871	61
North Dakota	323	520	62
Ohio	5,632	9,406	60
Oklahoma	1,110	2,284	49
Oregon	981	1,493	66
Pennsylvania	9,218	13,503	68
Rhode Island	601	958	63
South Carolina	713	1,427	50
South Dakota	295	493	60
Tennessee	1,558	2,961	53
Texas	3,851	6,952	55
Utah	510	585	87
Vermont	285	551	52
Virginia	1,995	2,920	68
Washington	1,639	2,234	73
West Virginia	919	1,834	52
Wisconsin	2,213	3,551	62
Wyoming	163	263	62

* This table gives the number of physicians (based on the 17th edition of the American Medical Directory) in the United States, the number receiving THE JOURNAL and the approximate percentage in each state. Copies to physicians in the United States Army, Navy and Public Health Service are not included.

THE JOURNAL has carried on the campaigns for which it has achieved great repute against nostrums and charlatans, cultists and inferior institutions of education. Among all the medical periodicals of the world THE JOURNAL is most frequently quoted in both medical and lay periodicals.

The net paid weekly average circulation in 1946 was 121,122 as compared with 111,407 in 1945, and the weekly average of copies printed in 1946 was 122,835, compared with 112,460 in the preceding year.

The accompanying table 1 shows the number of Fellows and subscribers on the mailing list of THE JOURNAL as of Jan. 1, 1946. Table 2 indicates the number of physicians in each state, the number receiving THE JOURNAL and the approximate percentage of subscribers in each state.

Field Service of the Editorial Staff

Many calls come to the editorial staff of the American Medical Association for addresses on a great variety of subjects to audiences of both the medical profession and the public. They are requested as well to conduct courses in educational institutions on scientific publications and other medical subjects.

Dr. Edwin P. Jordan, an associate editor, edits the "Standard Nomenclature of Disease and Standard Nomenclature of Operations" and attends the sessions of the American Association for Advancement of Science and of the American Association of Medical Record Librarians and has also spoken before several county medical societies and similar groups.

Dr. Johnson F. Hammond, an associate editor, has made several addresses annually for groups of physicians interested in problems related to medical writing and similar subjects.

The Editor of THE JOURNAL delivers many addresses each year to county and state medical societies, business clubs, forums and educational institutions. The Editor also serves on the medical advisory boards of the American Red Cross, the National Foundation for Infantile Paralysis and the Division of Medical Sciences of the National Research Council. He has also served as consultant to several national organizations and publications.

Special Journals

In spite of adverse conditions—shortage of help in the manuscript editing and mechanical departments, inability to procure sufficient paper and restrictions placed on the use of paper by the government—the Association has maintained the high quality of the special periodicals. With the January 1946 issue the format of all the special journals published by the Association reverted to that prevailing in 1944.

The number of pages in the special journals has not been greatly increased on account of paper restrictions and shortage of help, and consequently some have not yet caught up with the accumulated material awaiting publication.

Featured in the special journals are the collective reviews. In the ARCHIVES OF INTERNAL MEDICINE reviews have been published on blood, syphilis, neuropsychiatry, allergy, gastroenterology and infectious diseases. Reviews have appeared in the ARCHIVES OF OTOLARYNGOLOGY on allergy, advances in the understanding of rhinologic and otologic conditions related to the nervous system, otitis media and complications, peroral endoscopy, functional examination of hearing, the paranasal sinuses and contributions to plastic surgery. The ARCHIVES OF OTOLARYNGOLOGY took over publication of the yearly instalment of the review on otosclerosis prepared under the auspices of the Central Bureau of Research of the American Otological Society and is reprinting it in loose leaf form with an index of authors according to subjects. In the AMERICAN JOURNAL OF DISEASES OF CHILDREN there have been reviews on coronary occlusive disease in infants and children, the gastric phase of milk digestion in childhood, the relationship of pediatrics and psychiatry, the role of psychiatry in children's hospital service, the recurrence of infection following therapy with sulfonamide compounds and penicillin, and carcinoma of the adrenal cortex with the adrenogenital syndrome in children. The ARCHIVES OF OPHTHALMOLOGY published a review on ocular complications of malaria, one on alkali burns of the eye and one on metabolism of the retina. In the ARCHIVES OF SURGERY the series of articles under the heading "Progress in Orthopedic Surgery," prepared by an editorial board of the American Academy of Orthopaedic Surgeons, has been continued, and reviews of the literature on urologic surgery have also appeared. The ARCHIVES OF PATHOLOGY published a general review on tropical diseases, particularly the involvement of the nervous system. This periodical has also carried many excellent and helpful suggestions under the heading "Laboratory Methods and Technical Notes." The ARCHIVES OF NEUROLOGY AND PSYCHIATRY has published excellent articles on disturbances in sleep mechanism, studies in diseases of muscle, electric shock therapy, behavior disorders, neurologic diseases following infections of throat and skin, and the incidence of diphtheritic infections. In the ARCHIVES OF DERMATOLOGY AND SYPHILOLOGY there was a symposium on Diagnosis and Treatment of Cutaneous Cancer, which was presented at the New York Academy of Medicine, Section of Dermatology and Syphilis. This periodical continues to receive for publication practically all the papers read at the annual meeting of the American Dermatological Association. The publication of WAR MEDICINE was discontinued with the issue of December 1945, and the publication of OCCUPATIONAL MEDICINE was begun in January 1946. There has been a shortage of material for publication because the initial announcement regarding the establishment of the periodical was not made until November 1945. However, much progress is being made, and comments on this periodical have been most favorable.

Requests for the use of kodachromes and other colored illustrations presented in all of the special journals have increased.

To relieve stress on the Association's mechanical departments, permission has been given to authors and to commercial firms provided they have the author's consent also, to have reprints made by other printers in instances in which more than 2,000 copies are desired.

Circulation of all the special journals increased in 1946, from an increase of 152 for the ARCHIVES OF NEUROLOGY AND PSYCHIATRY to 1,826 for the ARCHIVES OF INTERNAL MEDICINE. As of Jan. 1, 1947 there were 2,253 names on the mailing list of the new journal OCCUPATIONAL MEDICINE.

Hygeia

The increasing demands on the American Medical Association Press and on the staff made necessary transfer of the printing of HYGEIA from the headquarters office to Kable Brothers, Mount Morris, Ill. By this transfer it became possible to have many more colored pages in each issue of HYGEIA and to assure regular appearance of the magazine at a definite date each month.

HYGEIA is the most quoted of all periodicals in the field of health, and many of its articles are reproduced widely in the digest magazines, in house organs of various industries, in the general press and on the radio. Its influence extends widely throughout the nation. Several state medical societies have arranged to provide a subscription to HYGEIA to each of the representatives and senators in their state legislatures. In other states, through efforts of the Woman's Auxiliary, HYGEIA has been provided to most of the leading educational institutions. The pages of the periodical are constantly sought by federal agencies in the field of health education, and the periodical cooperates completely with practically all national voluntary agencies in the field of health.

CIRCULATION

For the past five years the circulation of HYGEIA was held down because of the shortage of paper. Early in 1946 a small increase in paper tonnage was granted, so that it was possible to print an average of 164,537 copies a month, with the press run varying monthly from 155,450 in January to 192,000 in December. During 1947 an average monthly circulation of 200,000 or better will be maintained, depending on how much more paper can be purchased, as an advertising guaranty of 195,000 net paid circulation for 1947 must be met.

HYGEIA is greatly in need of additional reading pages, and as soon as feasible the number of pages in each issue will be increased from the present 80 to 96 or 112.

Most of the increased circulation of HYGEIA was obtained from selected fields, including physicians, dentists, schools, libraries, nurses and other health teaching groups. In the educational field the high school Group Study Plan was initiated whereby HYGEIA is furnished as an auxiliary text for classroom use at a special rate of fifteen cents a copy on school orders for ten or more copies. In a recent survey covering these groups, it was found that each copy of HYGEIA is read by an average of four students and that the magazine is used in classes on public health, physical education, biology, personal hygiene, first aid, physiology and science.

During 1946 HYGEIA was exhibited at the annual session of the American Medical Association and at the annual conventions of the American Nurses Association and the American Public Health Association.

In 1931 the House of Delegates urged the Woman's Auxiliary to the American Medical Association to recognize as one of its chief activities the promotion of the distribution of HYGEIA through parent-teacher associations, boards of education and similar groups interested in health education. The bulk of this work has been carried on principally by a comparatively small number of auxiliaries. With 600 organized county units reported last year, 90 per cent of the orders came from 25 per cent of the county auxiliaries; another 25 per cent showed interest, but more than 50 per cent took no part in the promotion of the magazine. Many of the county auxiliaries that were active did excellent work in introducing the magazine to new readers and in raising funds to present HYGEIA to schools, libraries, reading rooms and other organizations in their counties. The final figures for orders received from the Woman's Auxiliary during 1946 showed 15,631 years of subscription as against 11,383 for the preceding year.

At the end of the first year HYGEIA was published, 1923, the circulation of the magazine was 23,687, of which 14,175 subscribers were physicians. In December 1946 the circulation was 192,000, and of that number only 17,181, or 9 per cent of the subscribers, were physicians. Although the number of physicians in the United States has increased from 145,966 in 1923 to 196,881 in 1946, an increase of 28 per cent, subscribers to HYGEIA among the medical profession have failed to keep pace with the increase in circulation or with the increase in the number of physicians. It seems reasonable to believe that HYGEIA should have at least 50,000 circulation, or 25 per cent of the profession, among physicians. For several years the Minnesota State Medical Association has renewed 198 subscriptions placed for senators and representatives in the state legislature, while in Wisconsin the state medical society has renewed 220 subscriptions for legislators and distinguished citizens. HYGEIA, however, may need a reindorsement by the medical profession. The magazine could be a tremendous influence as a voice of the medical profession to the public if there were a larger circulation in the reception rooms.

For the sixth consecutive year HYGEIA showed, in 1946, a profit. A new high was reached in advertising income and in net paid circulation. The financial statement shows a profit of $56,876.26, compared with $108,214.21 for 1945 and $68,117.81 for 1944.

American Medical Directory

It is now almost five years since the Seventeenth Edition of the American Medical Directory was published in 1942. The delay in publishing the new edition is due to the shortage of clerical help in the Chicago area. It is hoped, however, that compilation will be started within the next few months so that the Eighteenth Edition will be ready for delivery by at least the middle of 1948. Since publication of the 1942 edition, information on more than 32,000 new physicians has been added to the files, and the names of more than 15,000 physicians who have died have been deleted. Reports have been received that more than 53,000 physicians have terminated their service with the government. Of this number more than 50,000 have furnished information concerning their present locations. About 7,000 physicians are still listed as serving in the armed forces.

Book Publications

The American Medical Association Press has issued more than a score of books which have attained tremendous circulation among the medical profession. Many of these books originate from articles published serially in THE JOURNAL. Others originate with the individual councils and bureaus of the Association. The increasing demands made on the American Medical Association Press by the expansion of circulation of THE JUORNAL and of the special periodicals and also for the publication of material developed by the various departments and councils made necessary the transfer of the printing and publication of these books to private medical publishers. The History of the American Medical Association and the Intern's Manual have been assigned to the W. B. Saunders Company, Philadelphia.

New and Nonofficial Remedies, Epitome of the U. S. Pharmacopeia, Useful Drugs and Fundamentals of Anesthesia will be published by the J. B. Lippincott Company, and Standard Nomenclature of Disease and Standard Nomenclature of Operations and Medical Writing by Blakiston. Negotiations are in process with other publishers for some of the other books published by the American Medical Association. Each of the books thus published will bear on its title page the statement "Published for the American Medical Association."

By this arrangement the Board of Trustees believes it will be possible to secure for these books an even wider circulation than has been possible through publication by the Association itself.

Library

The usual type of library service was maintained during the past year under much more difficult conditions than heretofore, owing to a shortage of personnel.

The package library department prepared and lent 2,865 package libraries. More requests were received for material on the Rh factor during the past year than on any other subject. Other popular subjects were anesthesia, undulant fever, arthritis, neostigmine therapy, treatment of poliomyelitis, penicillin and treatment of hypertension.

Various types of general reference questions were answered by the library staff, such as the preparation of recommended lists of books, the compilation of short bibliographies on recent literature of many different subjects and requests for the location of vast numbers of articles appearing in past issues of The Journal of the American Medical Association. Exact figures are not kept for the number of questions answered each year by the library department, but the number of requests exceeds 5,000.

Through the periodical lending service 11,401 periodicals were lent. This type of service seems to be increasingly popular and to be greatly appreciated by the physicians using it. The fact that the American Medical Association Library does not bind its periodicals has had a great influence on the number of requests received for periodical loans. In practically all libraries of the country periodicals are bound, and because of conditions in book binderies for the past two years the length of time taken in binding has greatly increased. Libraries are therefore denied the use of their periodicals while they are being bound. The fact that all the periodicals received in the library of the American Medical Association are available for loan during this "binding period" has been of great help to physicians.

In order to serve all of the members of the Association as promptly as possible regardless of their geographic location, the Library rules require a written request for the package library service. The bulk of reference work is therefore conducted by mail. In spite of this fact, approximately 500 visitors last year requested library service.

Three separate volume indexes to The Journal of the American Medical Association were prepared, as usual, in the Library and the total number of pages for the indexes in 1946 was 135.

Quarterly Cumulative Index Medicus

It is to be regretted that a report of the 1946 Quarterly Cumulative Index Medicus cannot include a brighter picture regarding a return to the normal printing schedule. As the January-June 1945 bound volume of the Index was not ready for mailing until Feb. 2, 1946, the only other issue of the Index Medicus issued in 1946 was volume 38, July-December 1945. Volume 39, January-June 1946, of the Index Medicus was sent to the bindery late in December 1946 but was not ready for mailing to subscribers until Feb. 10, 1947. It was possible to include in the 1946 volumes much more literature from European countries. Whereas 64 per cent of the foreign language material included in the 1942 Index covered Spanish and Portuguese periodicals, this percentage dropped in the 1946 issues of the Index Medicus to 51.5 per cent. Numerous requests have been received from medical periodicals published in Italy, France, Belgium and the Scandinavian countries for the establishment of exchanges with publications of the American Medical Association, and practically all requests for exchanges have been granted. The Library, therefore, was receiving in 1946, through exchange, about 180 medical periodicals from European countries. Many other foreign periodicals, of course, are purchased for indexing purposes. In volume 38, July-December 1945, 7,612 foreign language articles were included in the Index Medicus. In volume 39, January-June 1946, 10,461 foreign language articles were included. Thus there is beginning to be a gradual return to the normal amount of foreign language material included in the Index. A shipment of discarded periodicals covering the years 1933 and 1934 was sent to the Army Medical Library in accordance with an agreement between the Board of Trustees of the American Medical Association and the Army Medical Library.

Order and Mailing Departments

The Order Department in 1946 handled a total of 60,522 orders for 402,382 individual units. This rather small increase over the 386,844 units distributed in 1945 is attributed to many items being unavailable because of printing difficulties. The greatest demand was for material issued through the Bureau of Health Education and the Council on Medical Education and Hospitals. In handling the orders over 6,000 mail bags were used having a total content-weight of more than 186 tons.

The total number of pieces of letter mail handled by the Mailing Department in 1946 was 1,708,181, including 622,666 pieces of first-class metered mail, 39,875 pieces of air, foreign and overweight first-class mail and 1,045,640 pieces of third-class mail.

Employment Department

During 1946 new employees placed through the activities of the Employment Department totaled 307 as compared with 123 new employees during the year 1945. The value of the "screening out" process of the employment activity is indicated by the fact that the 307 placements represent the desirable applicants out of a total of 1,093.

Cooperative Medical Advertising Bureau

The Cooperative Medical Advertising Bureau, established thirty-two years ago, has continued since its reorganization in 1945 to increase its service and revenue to the state medical associations for their official publications. The Bureau earned $148,071.59 in commissions during its fiscal year December 1945 through November 1946. Cash discounts allowed on payments amounted to $12,425.84 and costs of operation to $22,781.78, permitting rebate to the participating journals of $112,863.97.

During 1946 the Bureau placed the largest amount of advertising in its history with the thirty-five state medical journals it serves, thereby making possible the largest returns to the journals in their annual refund, exceeding that of the previous year by $35,063.97. Including the monthly remittances, the net revenue to the state journals amounted to $557,049.18.

After distribution of the annual rebate checks to the member journals in December 1946, expressions of gratitude were received from practically every member for the increased portions derived from the added earnings of the Bureau.

Contracts on hand for 1947 indicate that an equal amount of business will be placed in state journals by the Bureau as was submitted for 1946, with a possibility of an increase unless present contracts are curtailed for economic reasons. Billing for December 1946 and January 1947 shows an increase of $10,236.21 over the corresponding months of the previous fiscal year.

Several meetings of the Advisory Committee were held during the year, at which matters pertaining to the work of the Bureau were discussed. Dr. Julian Price, Editor of the *Journal of the South Carolina Medical Association,* was elected a member of the Advisory Committee to succeed Dr. John S. Bouslog of Colorado, whose term expired.

Council on Pharmacy and Chemistry

An interim report on the work of the Council on Pharmacy and Chemistry was presented to the House of Delegates at its Supplemental Session in December 1946. The present report includes Council activities up to March 15, 1947.

REORGANIZATION OF WORK

The Council on Pharmacy and Chemistry, the Council on Foods and Nutrition, the Council on Physical Medicine, the Chemical Laboratory and the Bureau of Investigation form the Division of Therapy and Research of the American Medical Association. Each office has its own peculiar problems but there is a certain amount of overlapping medical consideration that encourages and, in fact, makes necessary at times an exchange of information and interchange of professional personnel. In the past, professional assistance has been made available for each office, but during the war most of this help was called into service by the armed forces or to perform other special duties. With the return of peacetime activities a plan was devised whereby the work of the units of this division at headquarters could be more closely integrated and overlapping and duplication reduced to a minimum. As a result of the plans now in effect, while the work of each council or bureau is maintained as a separate entity, the routine adopted to put into effect the work of these offices permits from an overall picture a new solidarity of effort. In this way each office contributes to the other, enhances the value of the units of the Division and increases the amount of work that can be done by this section of the American Medical Association.

MEMBERSHIP

Dr. Torald Sollmann and Dr. Isaac Starr were reelected to membership on the Council. Dr. Robert F. Loeb and Dr. C. Guy Lane were elected to fill the vacancies created by the resignations of Dr. Harold N. Cole and Dr. Elmer Sevringhaus. Dr. W. W. Palmer, who has served as a member of the Council for twenty-seven years, resigned because of plans for retirement and has been appointed a member emeritus of the Council. Dr. Palmer is the third individual to have been made a member emeritus of the Council, the other two being Dr. George H. Simmons and Dr. Robert A. Hatcher. Dr. Paul R. Cannon has been elected to fill the vacancy created by Dr. Palmer's resignation.

MEETINGS OF THE COUNCIL

At the meeting of the Council on Nov. 1, 1946 a conference was held with representatives of the American Pharmaceutical Manufacturers' Association and the American Drug Manufacturers' Association to discuss the rules of the Council. Suggestions were presented, following which there was open discussion. The Council was requested to assist manufacturers in the coining of protected and generic names. It was explained that the Council's Committee on Nomenclature already does this. Other suggestions discussed at the meeting were the exemption of certain official articles from the scope of Council consideration, the consideration of mixtures by the Council, the expediting of the Council's consideration of submitted products and the further exchange of information between the Council, the American Pharmaceutical Manufacturers' Association and the American Drug Manufacturers' Association. Immediately following this conference, the Council instructed its Secretary to prepare a redrafting of the rules incorporating the changes agreed on at the meeting with the manufacturers' representatives.

The discussions at the November meeting of the Council included warnings on labels of prescribed drugs, the responsibility of physicians in prescribing drugs known to have inherent dangers for their patients, the use of human plasma and plasma products, the advertising of products to the public, atomic fission products, preliminary reports on new substances and technics, the status of sulfobromophthalein and of BAL, specialty representation on the Council and the Therapeutic Trials Committee, the status of demerol hydrochloride, desirable dosage forms of drugs, the legal significance of the Council's seal of acceptance, medical patents, distribution of copies of New and Nonofficial Remedies to the American University of Beirut, liaison with organizations such as the National Institute of Health, Federal Food and Drug Administration and the U. S. Department of Commerce, the providing of assistance to the Technical Industrial Intelligence Committee of the U. S. Department of Commerce, and the status of high potency vitamin D preparations. At this meeting there were also presented reports of the Therapeutic Trials Committee and the Therapeutic Research Committee, two standing committees of the Council.

THERAPEUTIC RESEARCH COMMITTEE

During 1946 the Therapeutic Research Committee approved twenty-five grants to aid investigators in medical research. Approximately thirty-two articles were published during the year as a result of work done under the Council grants. A detailed report of the investigations conducted under the sponsorship of this committee will be found in the Addenda to the report of the Board of Trustees.

THERAPEUTIC TRIALS COMMITTEE

The Therapeutic Trials Committee, which was activated in April 1946, held its first formal meeting on Oct. 31, 1946. The Committee started its work by obtaining information with regard to available clinical investigators and facilities and, at the time of the meeting in October, the Committee had secured information from nineteen institutions following personal interviews with 89 investigators and had collected information on 311 investigators. Since that time the number of institutions has extended to twenty-seven and the investigators to 583. Six projects have been presented for the Committee's consideration, exclusive of numerous projects which were obviously unacceptable for consideration.

Dr. Chester S. Keefer is chairman and Dr. Stuart Mudd vice chairman of the Therapeutic Trials Committee. The membership, besides Dr. Keefer and Dr. Mudd, now consists of Dr. David Barr, Dr. Windsor C. Cutting, Dr. E. M. K. Geiling, Dr. Keith S. Grimson, Dr. Perrin H. Long, Dr. J. E. Moore, Dr. W. W. Palmer, Dr. Ralph M. Waters and Dr. W. Barry Wood, with Drs. Morris Fishbein, Austin E. Smith, Torald Sollmann and Walton Van Winkle, Secretary, as ex officio members.

An advisory subcommittee has been appointed to consider the technical aspects of a proposed investigation of testosterone and mammary cancer.

The Therapeutic Trials Committee has planned several reports for publication dealing with general problems related to clinical research. One such report, "The Cost of Clinical Research," was published in THE JOURNAL, Jan. 4, 1947, page 30. Among the projects undertaken by the Committee is the preparation of a series of articles on the statistical methods for clinical investigators.

To aid clinical investigators and to facilitate the rapid development of knowledge concerning new therapeutic agents and procedures, conferences have been planned to permit research workers in certain fields to meet and exchange information. Such conferences will be held of course only if there is a reasonable possibility that the meetings would facilitate the research and provide substantial benefit both to the investigators and to the medical profession.

The Committee is engaged in a joint project with the Council on Industrial Health, namely the evaluation of aluminum in the prevention and treatment of silicosis. The Committee has also been approached by other departments at Association headquarters and by organizations outside the American Medical Association to obtain its facilities for joint medical research. It is hoped that it will be possible to report in the near future on some of the joint efforts.

The Committee has rendered advice to manufacturers of pharmaceuticals regarding the scope of laboratory investigations of new remedies, has criticized plans of investigation submitted to it by sponsors of research and has assisted investigators desiring support for research problems by bringing them in touch with possible sources of funds.

PUBLICATIONS AND REPORTS

During 1946 the Council made available New and Nonofficial Remedies 1946 and began revision for the 1947 edition. Revision also was begun for Useful Drugs, the Epitome of the U. S. P. and N. F., and the A. M. A. Interns' Manual. During the early part of 1947 the revisions for these books were completed so that the publications would be available at the Atlantic City session in June.

During 1946 and up to March 15, 1947 the Council published ten status reports. Included in the reports were statements on BAL (British Anti-Lewisite) in the Treatment of Arsenic and Mercury Poisoning; Clinical Toxicity of Thiouracil; Histamine and Antihistaminic Agents; Human Immune Serum Globulin; Penicillin Facts and Rumors; Rutin; a joint report with the Council on Industrial Health on Aluminum in the Prevention and Treatment of Silicosis; Status of Methionine in the Prevention and Treatment of Liver Injury, and Possible Dangers of Tetrathionate Therapy of Thromboangiitis Obliterans.

The Council has long been known for its efforts in exposing widely exploited preparations with misleading claims. With the cessation of war activities, more attention could be given to this problem and as a result the Council prepared several articles on products that fall into this class, e. g. Cabasil, Formula A-N-1, Ethylene Disulphonate and a joint report with the Council on Industrial Health on Pyogen. More of these articles are now in preparation.

COUNCIL EXHIBITS

The Council office has prepared a number of exhibits for loan to state medical associations and to scientific sessions of allied professions. During 1946 and until March 15, 1947 exhibits were made available on fourteen occasions. Among the exhibits are displays relating to the barbiturates, chemotherapy, malaria, tropical diseases and endocrine products, and others relating to the work of the Council and its publications. When the exhibits are on display there is usually in attendance a physician from the Council office.

PROFESSIONAL RELATIONS

Representatives of the Council met with representatives of the American Pharmaceutical Association to discuss the control of barbituric acid compounds and to consider preparation of a "model bill," a bill designed to permit control at the state level. Such a bill has been prepared and generally agreed on. Copies may be obtained from the office of the Director of the Bureau of Legal Medicine and Legislation of the American Medical Association, from the office of the Secretary of the Council or from the office of the secretary of the American Pharmaceutical Association.

The Secretary and other members of the Council met with members of U. S. P. committees and subcommittees to discuss a variety of problems, including tests and standards for amino acids and the development of effective dermatologic ointments. The Secretary was elected to the U. S. P. Revision Committee. Several Council members are also members of a number of U. S. P. committees. There is close liaison between these two organizations, as there is between the Council and the American Pharmaceutical Association, which is responsible for the publication of the National Formulary, and between the Council and the Council on Dental Therapeutics of the American Dental Association, which publishes Accepted Dental Remedies.

The Council continued to make available its facilities and information for other departments at Association headquarters. It made a special attempt to provide assistance for the Cooperative Medical Advertising Bureau, as it has much sympathy for the problems of the constituent state medical associations.

The Council also continued its close relation with other organizations, including state and federal departments, and particularly with voluntary organizations such as the American Red Cross and the National Foundation for Infantile Paralysis.

The Secretary of the Council was one of three delegates from the American Medical Association to the Pan American Medical-Social Congress held during the first week in December in Havana, Cuba. The congress was called to discuss methods of promoting better exchange of information between the United States, Canada and the Latin American countries.

Chemical Laboratory

The close of 1946 marked the completion of forty years of service by the Chemical Laboratory of the American Medical Association in the interest of rational medicine. During this period, in seeking to discharge its primary function of assistance to the Council on Pharmacy and Chemistry, the Laboratory has enjoyed the cooperation of an ever increasing number of drug manufacturers in the drafting of suitable standards of identity and purity for new medicinal products.

Originally established to help the Council on Pharmacy and Chemistry in the disclosure of the nature of ingredients of products of doubtful merit, the work of the Laboratory has kept pace with the tremendous improvement in scientific medicine brought about by the combined efforts of the Councils of the American Medical Association, manufacturers and federal and state agencies. Today, as in earlier years, the Laboratory must confine its work to problems of general interest. It cannot undertake analyses for individual physicians and, of course, it does no commercial work.

WORK FOR THE COUNCIL ON PHARMACY AND CHEMISTRY

In connection with the consideration of new medicinals by the Council on Pharmacy and Chemistry, the Laboratory is called on to make chemical examinations of many active ingredients and finished dosage forms each year. Its findings are reported to the Council and are incorporated into tests and standards which are published in the book New and Nonofficial Remedies.

In 1946 the Laboratory examined the following products, for which tests and standards were drawn up with the cooperation of the manufacturers: Benadryl Hydrochloride, an antihistamine compound; Ceepryn Hydrochloride, a quaternary ammonium germicide; Demerol Hydrochloride, an analgesic and antispasmodic; Estinyl, an estrogen; Furacin, a topical antibacterial agent; Monocaine Hydrochloride and Monocaine Formate, anesthetics for local and spinal application; Sulfathalidine, intestinal antibacterial compound; Thiouracil, a synthetic antithyroid compound, and Tridione, synthetic anticonvulsant.

A considerable amount of time was spent in the examination of a large number of products for which standards are currently described in New and Nonofficial Remedies or in the U. S. Pharmacopeia and National Formulary.

The Laboratory continued to assist the Council on Pharmacy and Chemistry in connection with the preparation of monographs and descriptions of dosage forms of various products, published in THE JOURNAL during the year. Assistance was also provided in connection with the revision of N. N. R., 1946, and with correspondence on chemical subjects.

WORK FOR OTHER DEPARTMENTS OF THE ASSOCIATION

The Laboratory was of assistance to the Bureau of Investigation, the Library staff, the Editorial Department, the Advertising Committee and other departments through technical advice and a limited amount of chemical work.

Members of the staff have attended a number of scientific and technical conferences during the year.

Council on Physical Medicine

The successful employment of physical medicine during World War II has had a great influence on the acceptance of physical medicine by the general practitioner. As a result, physical medicine has gained in stature.

In 1946 the Council on Physical Medicine voted to strengthen its position in the branches of ophthalmology and otolaryngology. The move is in keeping with the trend of activities and problems coming to the attention of the Council.

Since the name of the Council was changed in 1944 from Council on Physical Therapy to Council on Physical Medicine, increasingly more apparatus for therapeutic and diagnostic purposes has been presented for consideration. Some of the appliances requiring immediate consideration are contact lenses, ophthalmic training equipment and hearing appliances for therapy and testing. The Council on Physical Medicine has been considering hearing aids and audiometers for more than ten years, and this work will be continued

As an indication of the return to civilian production, the work of the Council during the year has increased tremendously. Raw materials have become more plentiful and some of the materials are finding their way into the production of apparatus for therapeutic and diagnostic purposes. Approximately fifty appliances were submitted for consideration during the year. These devices included hearing aids, an epilation unit, sunlamps, respirators, allergenic devices, contraceptives, heat lamps and ultraviolet equipment. Investigations of approximately twenty devices were completed and reported on in The Journal.

PUBLICATIONS

The Manual of Occupational Therapy was revised and reprinted during the year. The Council now contemplates the revision of the Handbook on Amputations and the Manual on Physical Medicine. Four articles were published during the year: Radium, What Is Orthoptics? Eye Discomfort Caused by Improperly Shielded Black Light Ultraviolet Lamps and Requirements for Acceptability of Contraceptive Devices.

ATOMIC ENERGY

The discovery of the release of the energy within the atom has augmented the work of the Council. During the year the Council held a joint meeting of its recently appointed Consultants on the Medical Aspects of Atomic Energy, the Consultants on Roentgen Rays and Radium and the Council on Industrial Health. This joint meeting was held in December prior to the regular meeting of the Council. Briefly, the following decisions were reached:

1. To gather all available information regarding isotopes in use at the present time as related to medicine;
2. To prepare a statement regarding the dangers of radiant energy and methods of guarding against them;
3. To appoint a subcommittee to consider questions of thorium-X and radon ointment; and
4. To appoint a committee to consider the editorial usage for names of terms used in the field of atomic energy.

ARTIFICIAL RESPIRATION

The Council is continuing its survey of methods for artificial respiration which are being currently employed by lay organizations, life-saving crews, the Coast Guard and police and fire departments. Since undertaking these surveys the Council has clarified several controversial aspects of artificial respiration. A research project to investigate in the laboratory various methods of artificial respiration has been supported by funds allocated by the Board of Trustees. This research is being carried out by Dr. Henry Schwerma under the direction of Dr. Andrew C. Ivy.

PRODUCTS CONSIDERED

Several ultraviolet lamps recommended for disinfecting purposes have been considered. In general, the claims advanced for the efficacy of these products are exaggerated. The Council has found it necessary to withdraw acceptance of one of the disinfecting ultraviolet lamps which had been on the accepted list.

The Council voted to undertake the consideration of thermometry in the practice of medicine. The accuracy of calibration, manner of use and other problems related to clinical thermometers will be studied. A committee has been appointed, and this work is now going forward under the direction of Dr. George Morris Piersol.

The Council gave consideration to products for the relief of allergic hypersensitiveness. Several mattress and pillow covers were considered and accepted.

Radon ointments have been marketed to the profession for the treatment of radiation injuries, skin diseases and rheumatism as well as other conditions. A report has been prepared jointly with the Council on Pharmacy and Chemistry. It is the opinion of the Councils that unwarranted, exaggerated and misleading claims have been made, in the past, for the ointment. The investigation is being continued.

Ultraviolet irradiation of the blood: Although many therapeutic claims are made, the chief claim is the alleged successful treatment of asthma. In the opinion of the Council, this device is not efficacious and does nothing which cannot be accomplished by simpler means.

SEAL OF ACCEPTANCE

In the course of the year the Council voted to adopt a seal which has a format comparable to the seals of the Council on Pharmacy and Chemistry and the Council on Foods and Nutrition.

COUNCIL CONSULTANTS

Consultants on Audiometers and Hearing Aids: The article "Tentative Standard Procedure for Evaluating Percentage of Hearing Loss in Medicolegal Cases" has been released for publication. The revised audiogram chart was adopted and published. Six hearing aids were accepted and one was rejected.

Consultants on Contraceptive Devices: "Minimum Requirements for Acceptability of Contraceptive Devices" were adopted by the Council and sent to manufacturers of contraceptive devices for comment and suggestion. The requirements were referred to The Journal for publication. Three devices have been submitted for consideration, and one was accepted.

Consultants on Education: The consultants recommended that an American Board of Physical Medicine and a Section on Physical Medicine of the American Medical Association be established. Special study was focused on the training of a physical therapist. The Council has cooperated with the Council on Medical Education and Hospitals in studying this problem.

Consultants on Electrocardiographs: "Minimum Requirements for Acceptable Electrocardiographs" were compiled in rough draft and sent to six manufacturers of electrocardiographs for comment and criticism. The requirements are not complete and are still undergoing revision. One electrocardiograph has been submitted for consideration, but the report is not complete.

Consultants on Occupational Therapy: The "Manual for Occupational Therapy" has been revised and released for publication. It was ready for distribution Jan. 1, 1947.

Consultants on Ophthalmic Devices: An article entitled "What Is Orthoptics?" has been published. Consultants have voted to sponsor articles on contact lenses, artificial eyes and orthoptics. Articles on contact lenses and orthoptics are being considered at the present time.

Consultants on Respirators: Three respirators have been submitted for consideration. They are undergoing investigation at the present time.

Consultants on Roentgen Rays and Radium: A joint meeting of the Consultants on Roentgen Rays and Radium and the Consultants on the Medical Aspects of Atomic Energy with the Council on Industrial Health and the Council on Physical Medicine was held Dec. 12, 1946. The present status of the therapeutic efficacy of radium, radon and radioactive isotopes and an outline of the Council's future activities in these fields were discussed. On the agenda will be the compilation of requirements for acceptance of radium, radon and radon products.

Committee on American Health Resorts

The Committee on American Health Resorts continued as in 1945 with only four members instead of five. It is expected that a new member to fill the vacancy will be appointed in the near future.

On Jan. 2, 1947 the files and functional activities of the Committee were transferred from the Bureau of Health Education to the office of the Council on Physical Medicine. During the seven years of its existence the Committee has learned that much of its work is akin to problems of the Council on Physical Medicine.

Since the last annual report was published, the following health resorts have been listed by the Committee as meeting its official rules:

Saratoga Spa, Saratoga Springs, N. Y.

The Homestead, Hot Springs, Va.

The report on the acceptance of the Saratoga Spa appeared in The Journal for Aug. 3, 1946. The report on the Homestead has not been published but has been released for publication.

Council on Foods and Nutrition

The Council on Foods and Nutrition endeavors to promote improvement in the quality of foods through the application of scientific knowledge to the problems of the food industry. It encourages accuracy of labeling and advertising. It endeavors also to keep the medical profession informed of important advances in the field of foods and nutrition. It is concerned deeply with nutrition education for the medical student, for the practicing physician and for the public.

In reporting the work of the Council, it is necessary to retell occasionally what the Council's seal is intended to signify. When the Council's seal is used by a food company, it is intended to signify that the food product is as represented and that its label and the nutritional claims made for it are consistent with established knowledge or the best authoritative opinion. Acceptance is intended to signify further that the manufacturer, distributor or sponsor has complied and has agreed to continue to comply with the Rules and Regulations and the General Decisions of the Council on Foods and Nutrition.

To make Council acceptance mean these things requires constant vigilance on the part of the Council and the full cooperation of the medical profession. The work and the responsibility are far too heavy for the Council alone. Therefore it is urged that physicians as well as the sponsors of accepted foods and others notify the Council of violations of its Rules and Regulations and General Decisions. This cooperation will greatly assist in maintaining the Council's food acceptance program as an important factor in the maintenance of the nation's health.

In general, the makers of accepted foods and their advertising agencies have cooperated splendidly. This is due to an improved spirit of cooperation and the realization that the physician in practice expects labels and advertisements to mean what they say. The work of checking facts involves the full time of two staff members and part of the time of others together with a great deal of voluntary assistance by members of the Council and consultants.

One of the constructive efforts of the Council has been the stimulation of continued voluntary cooperation of food processors and advertising agencies in the food acceptance program. This entails the expenditure of many hours each week at the Council's office in consultation with representatives of the food industry from all parts of the United States.

ORGANIZATION

The decisions, policy and work of the Council are guided by its members, while responsibility for carrying out policy rests with the central office. Although a system has been established for the handling of routine problems, it is an interesting fact that most of the work requires individual attention and study.

Examples of important projects that have had to be temporarily rejected because of lack of personnel in the headquarters office are the preparation of a workbook dealing with intravenous feeding, the revision of the book "Protein Nutrition in Health and Disease," the preparation of short reports on the nutritive merits and uses of special purpose foods and expansion of the scope of the Council's food acceptance program.

The rapid development of the science of foods and nutrition demands the expansion of the scope of the Council and the preparation of more reports of advances in this field for the use of the profession.

MEMBERSHIP

Dr. Harold C. Stuart of Harvard University was elected to fill the vacancy created by the resignation of Dr. A. A. Weech. Dr. C. A. Elvehjem and Dr. Philip C. Jeans were reelected to membership to succeed themselves.

These three men are eminent in their respective fields of endeavor and it is the energy, experience and scientific integrity of these men and of the others who comprise the membership of the Council that has made the work of the Council an important contribution to the stature of the American Medical Association.

MEETINGS

Two meetings were held during the past year. Dr. James S. McLester and Dr. Howard B. Lewis were reelected chairman and vice chairman respectively. The following is a partial list of matters taken up at Council meetings and continued by means of its biweekly Bulletin: flour enrichment, corn meal enrichment, improvement of the nutritive merit of fruit juices, iodized salt, specific foods and brands, the essentiality of fats, balance in nutrition, the food requirements of the aged, misleading comparisons of wet and dry weights, the vitamin deficiencies, nutritional merits of strained foods and a consideration of particle size, the use of DDT on fruits to be canned, protein hydrolysates, nutrition teaching methods in medical schools and the Handbook of Nutrition.

RELATED PROGRAMS FOR PUBLIC WELFARE

Some of the great public health movements are concerned with matters of foods and nutrition, advancements in the development of which have led to improved public health and welfare. Some of the movements in which the Council has played an important role are as follows:

1. The Council gave continued support to the enrichment program for flour and its products. Two reports, on the enrichment of 80 per cent extraction flour and on the enrichment of macaroni, were published. The Council on Foods and Nutrition assumed an important role in starting this great public health movement and has consistently given its support to the program.

2. The Council reaffirmed its approval of iodized table salt at the level of 0.01 per cent of potassium iodide and recommended that legislation should be encouraged with a view to the establishment of a definition of table salt which should include the incorporation of a specified amount of iodine. It is assumed that pure sodium chloride will always be available for those who require plain salt. The iodized salt program is regarded as one of the important public health programs of this generation. During the past year the Council has reexamined nearly all the iodized salts bearing its seal of acceptance.

3. The vitamin D milk programs, another of the important public health movements, continues to receive the support of the Council. The routine work of this program requires the full time of one member of the office staff. Council accepted vitamin D milk is now produced and sold in the form of whole bottle milk, evaporated or dry milk in every part of the United States. To those who recall the high incidence of rickets twenty-five years ago, the scarcity of rickets today is little less than a miracle. That vitamin D milk plays an important part in this can hardly be doubted.

4. The Council encourages the production of fruit juices containing high natural levels of ascorbic acid (vitamin C) by offering acceptance to products that meet its standards. The tomato juice and the production methods of a large packer have been carefully studied and accepted, because by careful selection and good packing methods the producer is able to produce regularly juice which meets the Council's standard for vitamin C.

In addition, the product of two producers of fresh frozen orange juice has been accepted. Both of these brands of frozen juice meet the Council's standard for vitamin C. All companies producing Council accepted juices have accepted suggestions of the Council relative to containers and labels and have agreed to abide by the Council's rules with reference to advertising claims. The Council is studying other brands of juice at the present time.

Vitamin C standards set by the Council are, for tomato juice, 20 mg. per hundred grams; for grapefruit juice, 35 mg. per hundred grams; for orange juice, 40 mg. per hundred grams.

MISCELLANEOUS FOODS

Preliminary consideration has been given to a study of sanitary measures in cheese manufacture. The importance of this problem has long been known, and it is presumably true that cheese manufacture should be governed by measures which will make it as safe as pasteurized milk. It is believed that this subject is worthy of further study by the Council.

A joint committee of the Council on Pharmacy and Chemistry and the Council on Foods and Nutrition was appointed and met for the preliminary consideration of problems related to the protein hydrolysates.

During the year the Council again started the review and reconsideration of foods bearing the Seal which have been on the accepted list for more than two years. The reconsideration of accepted foods at regular intervals is essential in order to keep current knowledge of accepted products alive and up to date. The reexamination of foods will continue.

FIELD SERVICES

In addition to its normal activities the Council provides answers to inquiries on food and nutrition problems. Many of the questions come from the medical profession, and the Council office sincerely hopes that its facilities will be increasingly used by physicians and others. Evidence of the recognition given to this assistance is the frequency with which individuals visit the Council office.

Some of the meetings which the Secretary attended during the past year were the Canadian Red Cross Conference on the School Lunch, the Conference of the Children's Fund of Michigan, the meeting of the Food and Nutrition Board of the National Research Council and a public hearing of the New York State Joint Legislative Committee on Nutrition. The Secretary has also met with representatives of the Food and Agriculture Organization of the United Nations, the World Health Organization and other groups for discussion of matters of common interest. At the Council office an article was prepared for the December issue of the *Food Drug Cosmetic Law Quarterly* entitled "The Food Acceptance Program of the Council on Foods and Nutrition of the American Medical Association."

PUBLICATIONS

Basic material has been secured from eminent authorities for the preparation of reports on the teaching of nutrition in four branches of clinical medicine, namely medicine, surgery, pediatrics and obstetrics.

New printings with minor revisions were made of the Council's booklets "Rules" and "General Decisions." It is hoped that more extensive revisions may be made at a later time.

Of special interest has been the publication of a syllabus of the vitamin deficiencies called "Vitamin Deficiencies: Stigmas, Symptoms and Therapy." More than two hundred thousand have been printed. Permission was granted for a Spanish translation of "Protein Nutrition in Health and Disease."

The Council has sponsored publication of six reports in The Journal on special subjects and has made minor reports on other matters.

Handbook of Nutrition.—An important work of the Council in 1947 will be the extensive revision of the Handbook of Nutrition. The arrangement of sections and chapters is new. Many of the chapters will be entirely rewritten. Distribution will be made to the practitioner and the medical student.

NUTRITION EDUCATION IN MEDICAL SCHOOLS

It has been suggested by a number of interested groups that a survey of nutrition teaching methods should be made. The matter was taken up therefore with the Council on Medical Education and Hospitals, which gave its support. This is one of the most important of the Council's present activities, and it its hoped that it will give some assistance and guidance to a worldwide survey which is anticipated by the Food and Agriculture Organization of the United Nations. A pilot study has been authorized and started and will be completed in preliminary form in 1947.

As part of an effort to find new methods of intensifying the interest of medical students in the science of foods and nutrition and its relation to the maintenance of health, the Council has secured the assistance of Dr. C. G. King of the Nutrition Foundation in a cooperative project. The Council arbitrarily selected eight medical schools and two schools of public health and secured permission of their deans to supply all of the fourth year students of the medical schools and all of the students in the two schools of public health with *Nutrition Reviews*, which is widely and favorably recognized both in this country and abroad for its reporting of recent advances in the science of nutrition. The Nutrition Foundation has made this publication available gratis to the students.

Council on Industrial Health

During 1946 and the first quarter of 1947 the work and efforts of the Council on Industrial Health developed in many important ways.

PUBLIC RELATIONS

International Affairs.—A much greater interchange of experience needs to be developed by industrial physicians and hygienists in the Americas and Europe on a scientific nonpolitical level. A new form of international conference is proposed to include leading representatives of medicine, engineering, psychology and sociology who need to be mutually aware of developments occurring in these collateral fields. In the same direction a plan for the interchange of corresponding editors between principal American and foreign publications, covering industrial and forensic medicine, has been developed and is now awaiting approval. The Council on Industrial Health is prepared to facilitate these developments in all practical ways in anticipation of renewed activities in the field of industrial hygiene by the International Labor Organization and the World Health Organization.

Health and Welfare Programs.—The exact status of health and welfare programs for industrial workers remains unsettled, pending federal legislation defining labor-management relations, final disposition of the United Mine Workers employment contract and the appearance of the Boone Report, descriptive of working and living conditions in the soft coal mining districts. Meanwhile the Secretary of Labor, in his annual report to Congress, has advocated the increased use of health welfare programs in labor-management agreements as an effective and flexible means of providing greater social security through collective bargaining. He has indicated that these programs will assure greater industrial harmony and workers' security.

Union officials have met recently to discuss social security problems, including medical care and disability insurance. A tripartite study of health and industrial welfare programs for industrial workers is to be undertaken by the U. S. Department of Labor, the Social Security Administration and the Industrial Hygiene Division of the U. S. Public Health Service.

In view of the increasing participation of labor organizations in plans for industrial medical service and general medical care, the Council has instituted a series of visits to union health centers and will extend this type of field service into the existing types of medical care programs provided by industrial corporations.

Health Service for Federal Employees.—Public Law 658, passed by the 79th Congress, makes available to government employees emergency treatment of on-the-job illness, preemployment and periodic health examinations, health counseling, referral of employees to private physicians and dentists and a general program of preventive medicine. The federal offices intending to develop a service of this kind must either request personnel from the U. S. Public Health Service or operate under standards acceptable to that agency. The actual number of employees likely to come under the provisions of this law is still to be determined and may range from two and one-half million to four million people.

Labor-Management Relations.—The proceedings of the Supplemental Session of the House of Delegates called attention to the great public relations contributions which could be made by the Council on Industrial Health and recommended that every possible encouragement and facility be extended to the conduct of its work. The Council has under consideration at the present time several proposals intended to improve its contact with management and labor. These plans will be integrated into the overall public relations program of the American Medical Association.

SCIENTIFIC DEVELOPMENT AND EDUCATION

Medical Education.—The Council believes that every medical student should be acquainted with the essential details of industrial health and that every medical graduate should have sufficient knowledge of the subject to assure an intelligent attitude toward its relation to general and special practice. Visits are now being made to medical schools and to schools of public health to gather as complete information as possible about current educational practices in the industrial health field. Previous data, collected by questionnaire methods, have proved unreliable as a basis for constructing practical and realistic course outlines. Results so far indicate greatly improved appreciation of the importance of industrial medical education in both the undergraduate and the graduate field, but much remains to be done.

Residencies in Occupational Medicine.—At the request of the Council on Medical Education and Hospitals, criteria for residencies in occupational medicine have been developed. These are as follows:

"ESSENTIALS OF A RESIDENCY IN OCCUPATIONAL MEDICINE"

"The principal components in a training program for occupational medicine are as follows:

"1. Health Conservation:

"The physician in industry is expected to maintain and improve health, fitness and productive capacity through physical, mental and emotional appraisals, job evaluation and placement, health counseling and health education and through the application of medical and psychiatric technics to industrial human relations.

"2. Medicine and Surgery:

"Medicine and surgery in industry deal with occupational diseases and the surgery of trauma (including disability evaluation, rehabilitation and medicolegal aspects), control of preventable illness, the industrial implications of the medical and surgical specialties and emergency care.

"3. Environmental Hygiene:

"Environmental hygiene is concerned with the detection and control of occupational exposures, general plant sanitation and housekeeping, personal hygiene of workers, accident prevention, the application of regulatory codes and factory inspection laws.

"4. Administrative Methods:

"Administration includes industrial medical department planning and operation, integration with related in-plant functions, maintenance of adequate records and statistics and correlation with community medical, hospital and health services.

"To provide adequate training, several types of facilities are necessary:

"1. In-plant Services.

"The industrial medical department shall be of sufficient size and scope to accommodate the requirements of the plant and shall be under full time medical direction. The medical director should derive his authority in the plant from the officer directly responsible for policy and operations. It shall provide facilities and equipment and teaching material required for the training of a resident physician. Dressing and examination rooms, clinical and x-ray laboratories, wards and departments of physical medicine shall be available. Physicians in training should become familiar with records pertaining to (1) individual medical services and examinations, (2) plant inspections and technical industrial hygiene studies and (3) absentee analysis and control measures. A well equipped laboratory of industrial hygiene shall be readily accessible in the plant or through close affiliation. Monthly and annual summary reports shall be prepared outlining the work of the department.

"A competent accident prevention service is essential. Close correlation should be maintained with agencies in the plant responsible for hiring, job analysis, training courses and the maintenance of personnel policies.

"2. Hospital Services.

"Affiliated hospitals shall meet the general requirements for residency approval. There shall be organized services in the hospital under competent staff direction in internal medicine, dermatology, ophthalmology, traumatic surgery, neurology and psychiatry. A well equipped rehabilitation center should be supplied. Wherever possible, the hospital should be affiliated with a medical school or school of public health."

These criteria were developed with the assistance of the Committee on Medical Education of the American Association of Industrial Physicians and Surgeons. Approval of these essentials by the Council on Medical Education and Hospitals will be the first considerable step toward the realization of the certification program in occupational medicine.

Atomic Energy.—Atomic energy in medicine is of great interest to the Council on Physical Medicine and the Council on Industrial Health. Consultants have been appointed to advise these Councils relative to the use of radiant energy in diagnosis and treatment and respecting the development of necessary safeguards as atomic energy comes into general use as a practical source of power in industry and transportation.

Aluminum Therapy.—The Council is undertaking inspections of aluminum therapy installations in the foundry and pottery industry in order to arrive at a satisfactory estimation of the prophylactic and therapeutic value of this procedure. This is a joint undertaking with the Council on Pharmacy and Chemistry. Personnel from the Therapeutic Trials Committee of that Council are participating in the surveys.

Food Service and Sanitation.—A report on sanitary food handling having direct application to food service and nutrition in industrial plant cafeterias has been prepared jointly with the Council on Foods and Nutrition and is now ready for publication.

Research Activities.—Research in industrial hygiene and toxicology is essential to progress. Visits are being made to laboratories and other institutions engaged in investigative work. The facilities and specific interests of these agencies will be tabulated as a means of correlating research and mobilizing special resources when the need arises.

PROFESSIONAL RELATIONS

Field Activities.—Field activities have been mainly directed at improving the effectiveness of the committees on industrial health in the state and county medical societies. Many are doing excellent work, others are not. Regional conferences have been held, attended by physicians, industrialists, labor leaders and others as a means of promoting industrial health activity at community levels. At these conferences emphasis has been placed on health service to small industries. The Medical Society of the County of New York has authorized its special committee on industrial medicine to organize and conduct a three year program the objective of which is to bring modern health service to every industrial plant in that area. The Council has examined these proposals and has approved them.

Congress on Industrial Health.—The Seventh Annual Congress on Industrial Health was held in Boston with the Council of New England State Medical Societies and the Massachusetts Medical Society as co-sponsors. The satisfactory character of this meeting has convinced the Council of the wisdom of conducting these meetings in various parts of the country.

Speakers Panel.—Lists of speakers have been established, made up of physicians and others in various parts of the country able and willing to express the point of view of organized medicine in matters of industrial health. This activity has been conducted as a part of the general public relations program of the American Medical Association.

WORKMEN'S COMPENSATION AND REHABILITATION

Workmen's Compensation.—The Council has continued to participate actively in the work of the National Workmen's Compensation Conference Committee in company with representatives of industrial commissions, casualty insurance companies, labor and management. Preliminary reports have been completed outlining the need for investigation and reform in the several fields of report forms, statistics, medical testimony, hearings and appeals, disability evaluation and rehabilitation. Consultants have been invited to assist in the consideration of these important matters. The medical profession needs to be adequately represented in all discussions of workmen's compensation and rehabilitation.

Disability Evaluation.—A series of conferences on disability evaluation is in preparation. Industrial commissions, and physicians as well, are greatly concerned over the unsatisfactory and unscientific methods currently employed to measure disability. Excellent work has already been accomplished along these lines by the Section on Ophthalmology and the consultants on otolaryngology to the Council on Physical Medicine. Much of the proposed activity will fall in the fields of traumatic surgery and orthopedics.

Bureau of Health Education

The year 1946 represented a turning point in the history of the Bureau of Health Education. After almost six years of wartime and postwar retrenchment and marking time, it became possible at last for the Bureau to realize some of the progress which had been planned during the war years. The study of the Bureau made as a part of the Rich survey of the Association as a whole supported many of the recommendations already in the minds of the Director and Associate Director of the Bureau. As far as this Bureau was concerned, the Rich Report was, in the main, helpful, although it was evident that the Rich Associates did not have an adequate conception of the functioning of this Bureau in its liaisons or an understanding of the purpose of its radio programs.

During 1946 the Board of Trustees authorized two very important organizational changes in the Bureau. One was the creation of a position entitled Administrative Assistant to the Director; the other was a position entitled Pamphlet Editor. The former was intended to relieve the Director of routine administrative work and permit him to devote more time to direction, study and liaison relationships, and the latter was created for the purpose of correcting deficiencies in pamphlet publications pointed out in the Rich Report, though fully realized previously and remaining uncorrected only because of lack of personnel.

Other important additions to the Bureau personnel were made during the year. The establishment of the Health and Physical Fitness Project in the Bureau of Health Education necessitated two additions: Dr. Dean F. Smiley functions as the medical adviser in this project, and Fred V. Hein, Ph.D., is the educational consultant. Dr. Smiley became a member of the staff on Aug. 15, 1946 and Dr. Hein on Sept. 15, 1946. A complete and full description of their duties is contained in that portion of this report entitled "Health and Physical Fitness."

BUREAU PUBLICATIONS

The Bureau reviewed six books for THE JOURNAL and sixteen for HYGEIA and prepared seven other contributions to THE JOURNAL and ten to HYGEIA, including editorials, radio announcements, articles and news items.

The Bureau originated twenty-one articles published in periodicals other than those of the American Medical Association. Advice and consultation on manuscripts were furnished twelve organizations.

RADIO BROADCASTING

Radio broadcasting was begun in January on the NBC network under the title "Doctors at Home" and continued for twenty-six weeks. It proved to be the most successful series thus far broadcast in the twelve years of dramatized broadcasting.

Special broadcasts were made over the three major networks in connection with the annual session of the Association at San Francisco in June.

The script library continues to shrink both in number of available talks and in demand for local usage. This library now offers 219 fifteen minute and 170 ten minute talks. Six county medical societies and auxiliaries, one state medical association, three local health departments and two miscellaneous agencies used these scripts in 1946, requesting only 142 talks. There is no record of how many of these scripts were broadcast.

ELECTRICAL TRANSCRIPTIONS

Electrical transcriptions continued to form a major part of the Bureau's activity. It is estimated that during 1946 there were between 4,000 and 4,500 local broadcasts of these transcriptions on approximately 120 outlets, mostly those not reached by network programs. These figures are estimated because the exact number of broadcasts made through local outlets could be ascertained only by a time consuming and expensive survey. The figures published are based on the number of transcription loans made and the assumption that unless the Bureau was notified to the contrary each of the recordings was broadcast.

The following new series of electrical transcriptions was added by the Bureau during the year:

Melody of Life. Thirteen quarter-hour interludes, with music of great composers. The life stories of musical masters and what medicine could do for their health problems today.

Keeping Your Baby Well. Thirteen quarter-hours with pediatricians selected by the Section on Pediatrics, interviewed by Harriet Hester about everyday problems in child care.

Fair and Cooler. Thirteen quarter-hours of delightful piano selections, with suggestions for health and comfort in the good old summer time.

Time Out! Thirteen quarter-hour programs of organ music, with brief health suggestions by Dr. W. W. Bauer and Dr. William W. Bolton.

That Wonderful Feeling! Health as a fundamental necessity to physical, mental and emotional fitness; thirteen dramatized scripts by William J. Murphy.

TELEVISION

On April 2, 1946 the first of a series of health education television programs was presented over station WBKB, Chicago. This venture has been continued, and through December a total of nineteen telecasts had been given. It has been demonstrated that television offers an excellent medium for health education. With the helpful cooperation of the WBKB staff a satisfactory method of presentation has been developed. Included in this are dramatic episodes enacted by professional actors. It has also been found helpful to utilize portions of health education films. Perhaps the most difficult obstacle has been getting away from the "lecture" type of presentation. One method that has proved of help is the interview form of program. It is recognized that, in order to sustain audience interest and attention, various aspects of the subject must be considered in turn. Another obstacle has been the fact that, unlike radio, the participants are not able to read their contributions from a prepared script. In spite of these problems it is felt that the possibilities for health education over television are excellent.

HYGEIA LOAN COLLECTIONS

An increase was noted in the requests for HYGEIA loan collections from this Bureau. Eighty-two such collections were sent out during the year, as compared with fifty-eight for the previous year. A definite shift in the source of requests for these collections, which contain material that can be incorporated into discussions before lay groups, has been observed. Of the eighty-two requests, only thirty-eight came from physicians. The remainder were from professional workers engaged in health education. These included teachers, nurses and directors of local health units. In addition there were some requests from individuals connected with various civic groups. It is believed that the requests from physicians are no longer as numerous because increased activity at the state society level has made it possible for physicians to obtain this material from these sources. In addition to this encouraging conclusion, the fact that nonmedical individuals are finding the loan collections helpful might well be considered concrete evidence that health education is making definite progress.

The loan collections went to twenty-five different states. The subjects most in demand were cancer, medical advances, health education and sex education.

HEALTH AND PHYSICAL FITNESS

The establishment of the Health and Physical Fitness Project in the Bureau of Health Education was an added step forward in the efforts of the American Medical Association to contribute to the promotion of health. The Board of Trustees early in 1946 authorized the establishment of this project in the Bureau of Health Education to work under the supervision of the American Medical Association's Committee on Health and Physical Fitness.

The project includes the health and fitness problems of the preschool child, the school child, the college student, the adult, both rural and urban, and the industrial worker. Though the Committee contemplates cooperation with all other health agencies working toward health improvement in home, school, industry and community it has expressed the belief that the most immediate and practical approach to the problem lies first in the schools and second in industry. The efforts of the consultants in the project are therefore directed primarily to these fields.

The Committee did not attempt to set up any master plans or "ideal" programs and then to foster their widespread adoption in the schools and industries. Rather will it be the purpose to implement as far as possible plans already recommended by the various professional groups and to accumulate information on the varied health programs now in use with the purpose of making both reports on these programs and advice and counsel available, on invitation, to boards of health, boards of education, employers, employee groups, medical societies and women's organizations.

The project is, in a sense, a continuation of the work carried on by the Association in conjunction with government agencies and other interested groups during the late war. Including the project in the total health education program of the Association and staffing it with a physician who has had wide experience in health education and an educator experienced in the health and physical education fields will give it a permanence and a practicability lacking in the previous organization.

Covering the period from Aug. 15, 1946 to Jan. 1, 1947, the following work has been undertaken and brought to completion or carried to the point of progress described:

A source file was prepared which includes materials on school health and physical education from over forty states and many voluntary and official health organizations. Materials concerned with curriculum planning from several states were reviewed by the consultants. The manual "Health Inspection of School Children" has been revised under the title "Standards for Determining the Health Status of School Children" and has been submitted to the Joint Committee on Health Problems in Education of the National Education Association and the American Medical Association.

Contemplated legislation relative to school health and physical education was studied and the proper department at Association headquarters advised in regard to the nature and content of projected bills. The consultants have also been called on to review a considerable number of films and other audiovisual aids for use in school health and physical education instruction.

With the approval of the Board of Trustees, the consultants have begun work as members of the following national committees:

National Committee on Standards for Interscholastic Athletics of the American Association for Health, Physical Education and Recreation.

National Committee on Standards and Surveys in Health Education of the *American Association of Teachers Colleges.*

Committee on Health Education for All College Students of the Third National Conference on Health in Colleges.

Subcommittee on Tuberculosis, National Research Council.

The Council of the American Student Health Association.

A series of thirteen radio transcriptions on health and physical fitness, "That Wonderful Feeling," was prepared for use by state or local medical societies or by other groups having the approval of the medical societies. A television program on physical fitness was broadcast over station WBKB Nov. 7, 1946.

The consultants served as participants in working conferences and gave talks at health and physical education conferences or other group meetings in Arizona, Illinois and Wisconsin. Each consultant prepared and submitted material to be used as a basis for one chapter of the book "Health Education" now being revised under the auspices of the Joint Committee on Health Problems in Education of the National Education Association and the American Medical Association. Each month the consultants prepare a series of "Suggested Discussion Topics" for the classroom use of HYGEIA, the Health Magazine, in secondary schools.

During the third of a year in which the project has been functioning the consultants have necessarily devoted a considerable amount of time to familiarizing themselves with the organization and operation of the American Medical Association. There has also been considerable orientation required in properly establishing the project as an integral part of the function of the Bureau of Health Education. An attempt has been made to bring about worth while working relationships with other committees and with the various Bureaus and Councils of the American Medical Association.

PAMPHLETS

Thirteen new pamphlets were added during the year to the Bureau's list of publications, and three were discontinued. Distribution of Bureau publications through the Order Department was 182,989; the Bureau sold 47,100 reprints direct to quantity purchasers, making a total of 230,089. Because of the paper shortages and the large amount of work in the printing department, permission was granted in a number of instances for local reproduction of articles in HYGEIA. A total of 1,450 copies of different HYGEIA articles were reproduced locally, according to reports sent to the Bureau of Health Education.

MEETINGS AND CONFERENCES

The Bureau staff traveled 64,851½ miles to attend meetings or address audiences in twenty states. Audiences numbered ninety-three and totaled 18,995 persons. The Bureau staff participated in seventy-nine conferences and committee meetings. It was necessary to decline twenty-nine engagements because of previous commitments or travel difficulties.

COOPERATIVE RELATIONSHIPS

Joint Committee on Health Problems in Education of the National Education Association and the American Medical Association.—The 1946 meeting of the Joint Committee was held for the third successive year at American Medical Association headquarters. The Committee reelected Dr. Thurman B. Rice chairman, Miss Bernice Moss was elected vice chairman and Dr. W. W. Bauer was reelected secretary.

The principal items dealt with by the Committee were as follows:

1. Standards for Determining the Health Status of School Children. A mimeographed statement about the minimum health program for school children; the objective in the health observation by the teacher, and the reasons for further observation and investigation. It sets forth the conditions which the teacher should note daily and deals with special problems.
2. The proposed procedure for establishing the American Medical Association Physical Fitness Project.
3. Statements on (1) the ultraviolet radiation for disinfecting purposes in schools, (2) hearing aids for children and adults, and (3) eye testing appliances, presented by Mr. Howard Carter of the Council on Physical Medicine.
4. Cancer control as a major health problem in the United States, a statement concerning which was authorized. Scientific facts about cancer should be taught to high school students.
5. The use of tampons. Adoption of any specific stand in relation to the use of vaginal tampons does not appear desirable to the Committee and a statement was issued to that effect. The Committee feels that the subject is in danger of becoming exaggerated. Questions should be answered by teachers referring inquirers to a physician for individual advice based on physical findings.
6. A Nutritional Program for Schools. The Committee gave careful consideration to this report, prepared by Dr. Glenville Giddings, and a subcommittee was appointed to condense and modify the Giddings manuscript.

U. S. Children's Bureau Advisory Committee.—No meeting of this committee was held during the year.

National Committee for Boys & Girls Club Work (4-H Clubs).—The work of this committee proceeded as usual, with meetings in December. The great importance of this work from the health standpoint resides in the local effectiveness of health instruction, dietetics, home economics and the like. This appears to grow stronger year by year. The disturbing feature about this relationship is the increasing reliance on federal subsidies, but those concerned in the work seem to regard such subsidies as necessary and do not appear to be alarmed by their practical application.

National Congress of Parents and Teachers.—The National Congress of Parents and Teachers is reorganizing its health work on a broader basis, in which the health interests in general are emphasized more than the Summer Round-Up of the Children, which was formerly the principal emphasis. In its health work the National Congress continues to declare itself in favor of private enterprise, but its Washington representatives also continue to support the extensions of the Children's Bureau work into the fields of private medical practice.

American Public Health Association.—The term of the Director of the Bureau of Health Education on the Governing Council expired and he was not renominated. In view of his outspoken opposition to the adoption by the association of its declaration in favor of compulsory federal health services, this was not unexpected. The Director continues to serve as a member of the Committee on Professional Education. He is now in his second term and presumably will be ineligible for reappointment at the end of that term. The work of this committee is thoroughly scientific and professional and should have a fine constructive influence in public health circles. The most interesting and significant of present projects before the committee is the accreditation of schools of public health issuing the degree of Master of Public Health and Doctor of Public Health. In this work the pioneering of the American Medical Association Council on Medical Education and Hospitals is having a definite though unobtrusive influence.

American Cancer Society, Educational Committee.—This committee is in the developmental phase. It is a large committee, representing much advisory ability and a great deal of potential power. Like all advisory committees, its ultimate effectiveness depends on how its advice is received.

United States Government Agencies.—The Bureau continues to cooperate, largely by correspondence, with government agencies. Materials or information have been furnished during 1946 to many branches of the government departments and agencies.

War Department.
Navy Department.
Federal Security Agency.
Department of Agriculture.
Department of the Interior.
Federal Works Agency.
Pan American Sanitary Bureau.
Institute of Inter-American Affairs.
Veterans Administration.
House of Representatives.

MISCELLANEOUS

The Bureau continued to compile information about attacks on and defense of medical research and to distribute it in response to requests.

The Bureau furnishes questions and answers to Hygeia for publication and checks all galley and page proofs for medical accuracy.

The Bureau continues its cooperation with the Woman's Auxiliary.

Eight students from Yale University spent four days during June observing the health education work of the American Medical Association.

APPRECIATION

The Director of the Bureau wishes to express his appreciation to the Trustees and to the General Manager for the confidence which they have placed in this Bureau and for the opportunities for increased constructive service which they have granted in the course of the year 1946 and by advance authorization for 1947 activities.

Appreciation should be recorded for the physicians and members of other professional faculties in the many universities and for the physicians in private practice and in public health work who have been called on for answers to questions and for advice and consultation.

Bureau of Investigation

In 1946 the Bureau of Investigation had one of its busiest years in carrying on its part of the Association's activities. Correspondence showed the largest increase in three years, and the Bureau almost doubled its 1945 contributions to The Journal in number and column space.

INQUIRIES

Special groups whose inquiries were particularly numerous were teachers and students, newspapers, radio stations, federal agencies, Better Business Bureaus and farm publications. All possible assistance was given to them, as well as to other inquirers, who included physicians, state licensing boards, welfare organizations, research workers and the general public. Every day brought inquiries from newspapers and Better Business Bureaus, and nearly as frequent were those coming from state boards and the federal Food and Drug Administration, the Federal Trade Commission and the Post Office Department. There were also some from the Federal Bureau of Investigation. In many instances the Bureau gave considerable time to personal interviews with representatives of these agencies. In return, the latter have cooperatively given the Bureau new and valuable information for its files.

SPECIAL SERVICE GIVEN

The Bureau has seen its work bear fruit in the legal actions brought against quacks and "patent medicine" promoters by federal and state agencies whose attention has been turned toward such offenders by this department. Numerous fraud orders issued by the Post Office Department and prosecutions of medical practitioners and nostrum exploiters have been the result of the Bureau's being the first to furnish information about them to various government departments and state licensing boards.

ASSISTANCE TO SCHOOLS AND OTHER GROUPS

The Bureau increased its service to teachers and students seeking light on nostrums and cosmetics, inviting them to send lists of such products, on which helpful reports were supplied. The pupils ranged from those having "projects" in grade school classes to college students writing theses. Many of the recipients expressed their gratitude for the assistance given them.

Information on many subjects has been given to women's groups, including clubs, the W. C. T. U., student nurses and Red Cross home nursing classes, though the latter division is less numerous since the close of the war.

The vigilance of the Better Business Bureaus over the country demands prompt information from this department on quacks, impostors, nostrums, cosmetics and various medical schemes, and these bureaus have warmly acknowledged the assistance furnished, which can be obtained from no other source. Newspapers and magazines have been similarly served. Much information has been given to inquirers about three especially conspicuous medical promotions—the Kaadt "diabetes cure," the Koch "cancer cure" and the "Spectro-Chrome Therapy" of Dinshah P. Ghadiali. All of these have been in the courts in the past year.

PUBLICATIONS AND MISCELLANEOUS SERVICES

Sales of the Bureau's pamphlets in 1946 amounted to 700 copies, an increase of 50 over 1945, and many were sent free to teachers and students. The book "Nostrums and Quackery and Pseudo-Medicine" sold in 1946 to the number of 134 copies. Thirty-five columns of material were contributed to The Journal, representing twenty-nine articles based on the Bureau's investigations and abstracts of government actions.

In August 1946 the Acting Director of the Bureau took part in a television broadcast on "Medical Fakes."

The Bureau's lantern slides and film strip dealing with the nostrum evil and quackery were lent to physicians and educators over the country.

Bureau of Legal Medicine and Legislation

The report of the Bureau submitted to the supplemental session of the House of Delegates last December reflected the more important laws of medical interest enacted during the closing days of the Seventy-Ninth Congress. That report was published in The Journal for Dec. 21, 1946, and a repetition of its contents in this report would serve no useful purpose. It will be more timely if a summary is given of legislation of concern to medicine that has been introduced in the Eightieth Congress to date and in the legislatures of the several states now in session.

FEDERAL LEGISLATION

The Eightieth Congress convened January 3 of this year, and although it has been in session for a period of only about three months, a manifest interest in problems of health is already reflected in the considerable number of bills that have been introduced relating to various aspects of such problems. Hearings have already been scheduled on some of the bills, and indications are that others will receive the consideration of committees between now and the time of the meeting of the House of Delegates in June.

Federal Department of Health.—Four days after the Congress convened, Representative Miller of Nebraska, a doctor of medicine, reintroduced his bill, as H. R. 605, to establish at the seat of government an executive department to be known as a Department of National Health. At the head of this department would be a Secretary of National Health, appointed by the President by and with the advice and consent of the Senate. It is contemplated that in this department will be centralized all activities of the federal government related to health, and the President will be authorized to transfer to it such existing agencies and functions as he may determine to be appropriate.

Another pending bill, S. 140, introduced by Senator Fulbright, Arkansas, for himself and Senator Taft, Ohio, proposes the creation of an executive department of the government to be known as the Department of Health, Education and Security. A similar bill is pending in the House, H. R. 573, introduced by Representative Harris, Arkansas. The Senate bill provides for the appointment by the President by and with the advice and consent of the Senate of a Secretary of Health, Education and Security to act as the head of the new department. The bill does not set forth the qualifications to be possessed by the Secretary. There would be three main divisions in the department, each under the immediate supervision of an Under Secretary, a Division of Health, a Division of Education and a Division of Security. The Under Secretary of Health would be a doctor of medicine licensed to practice medicine or surgery in one of the states or territories of the United States or in the District of Columbia. Provision is made for the appointing by the Secretary of advisory committees to advise and consult with him. The Office of the Federal Security Administrator and the Federal Security Agency, and its constituent units, together with all their functions, would be transferred to the new department. To the Division of Health would be specifically transferred the U. S. Public Health Service, the Freedmen's Hospital, the Food and Drug Administration and the Federal Board of Hospitalization. To the Division of Security, the Under Secretary of which will be a person experienced in the field of social security and welfare, will be transferred the Committee on Economic Security and the Children's Bureau. While the House of Delegates has repeatedly urged a National Department of Health, it has recognized the dangers incident to mingling in one department health and other functions. At a special meeting held in 1937 at a time when a reorganization of governmental activities in the executive departments was under consideration, the Board of Trustees prepared a statement expressing the opinion that "health activities of the government, except those concerned with the military establishments, should not be subservient to any other departmental interests." This action of the Board of Trustees was approved by the House of Delegates at its meeting in Atlantic City in June 1937. A preliminary hearing has been held on this bill by the Senate Committee on Expenditures in the Executive Departments, and additional hearings have been scheduled at which the points of view of various interested groups will be presented, including the point of view of the American Medical Association.

A third bill, S. 712, introduced by Senator Aiken, Vermont, proposes that the Federal Security Agency be constituted an executive department in the government and that its name be changed to the Department of Health, Education and Security. At its head would be a Secretary of Health, Education and Security, and there will be in the department an Under Secretary and two Assistant Secretaries. The qualifications to be possessed by the Secretary, the Under Secretary and the two Assistant Secretaries are not prescribed. A duty will be imposed on the new Secretary to foster and promote the general welfare of the people of the United States in matters pertaining to their health, education, social welfare and social security.

There is also pending a fourth proposal, a part of S. 545, introduced by Senator Taft, Ohio, for himself and Senator Smith, New Jersey, Senator Ball, Minnesota, and Senator Donnell, Missouri, which would create in the executive branch of the government an independent agency to be known as the National Health Agency. This agency would be administered by a National Health Administrator appointed by the President, by and with the advice and consent of the Senate. This Administrator, it is proposed, will be a doctor of medicine licensed to practice in one or more of the states and outstanding in the field of medicine. There will be centralized in this agency the activities of the federal government relating to health except that no power, function or duty exercised by the Army, the Navy or the Veterans Administration will be transferred to the Agency. In the Agency there will be the following constituent units: (1) the Office of the Administrator; (2) the Public Health Service; (3) the Office of Medical and Hospital Care Services; (4) the Office of Dental Care Services; (5) the Office of Maternal and Child Health; (6) the Office of Health Statistics; (7) the Food and Drug Administration; and (8) such other constituent units as the Administrator finds necessary. The Director of the Office of Medical and Hospital Care Services will be a doctor of medicine licensed to practice medicine in one or more states, who has had at least five years of active medical practice and who is outstanding in the field of medicine.

Cancer and Other Medical Research.—Senator Pepper, Florida, has reintroduced his bill, S. 93, which would authorize the President to undertake to mobilize at some convenient place or places in the United States an adequate number of the world's foremost experts and coordinate and utilize their services in a supreme endeavor to discover means of curing and preventing cancer. An appropriation of $100,000,000 would be authorized to enable the President to carry out the provisions of the bill. Similar bills are pending in the House of Representatives, H. R. 292, introduced by Representative Rooney, New York, and H. R. 780, introduced by Representative Douglas, California. Another bill, H. R. 100, introduced by Representative Dirksen, Illinois, would make a similar request of the President but would authorize only $50,000,000.

There is still another bill, H. R. 977, introduced by Representative Stevenson, Wisconsin, which suggests the creation of a National Medical Research Foundation to initiate, conduct and support scientific research with respect to the cause and cure of cancer, poliomyelitis, rheumatic fever, Bright's disease, asthma, arthritis, leukemia, encephalitis, arteriosclerosis, aplastic anemia, rheumatic heart disease, diabetes and other degenerative diseases of the human race. To enable the foundation to carry out its powers and duties, there is suggested an appropriation of $10,000,000 annually.

A section of S. 545, the Taft-Smith-Ball-Donnell bill, would authorize an annual appropriation of $10,000,000 to enable the Surgeon General of the Public Health Service to develop more effective measures for the prevention and control of cancer and to assist, through grants, states, counties, health districts and other political subdivisions of the states in establishing and maintaining adequate measures for the prevention and control of cancer.

The draft of still another bill relating to research in cancer has been prepared and will shortly be introduced by Senator Taft, who may be joined by other senators in sponsoring the legislation. It will create a National Cancer Research Commission consisting of fifteen members, ten of whom will be eminent scientists, expert in the field of medicine or the basic sciences, and five of whom will represent the public, all appointed by the President by and with the advice and consent of the Senate. There will be authorized to be appropriated, for the fiscal year ending June 30, 1948, the sum of $5,000,000; for the fiscal year ending June 30, 1949, the sum of $10,000,000; for the fiscal year ending June 30, 1950, the sum of $15,000,000; for the fiscal year ending June 30, 1951, the sum of $20,000,000; and the fiscal year ending June 30, 1952, the sum of $25,000,000. This commission will be authorized to formulate a program designed to provide for and to coordinate scientific research directed toward the discovery of the cause or causes of cancer and means for its prevention by eminent experts in such research from the United States and abroad. It is contemplated that grants will be made to not more than ten large public or private research centers in the continental United States and possibly to additional smaller public or private research facilities. Fellowships for research at institutions in the United States will be authorized, and the commission will have authority to make grants for individual research projects at institutions in the United States. There will be a National Administrator of Cancer Research to be appointed by the Commission.

Another bill relating to medical research, S. 720, introduced by Senator Pepper, Florida, follows the pattern of his cancer research bill. It would authorize the President to mobilize in the United States the world's foremost experts and coordinate and utilize their services in an effort to discover new means of treating, curing and preventing diseases of the heart and arteries. An appropriation of $100,000,000 would be authorized.

National Science Foundation.—In the report of the Bureau submitted to the House of Delegates in 1946 at San Francisco, reference was made to the proposals being considered by the Congress to create a National Science Foundation. There were two particular bills that occupied prominent positions, the Magnuson bill, S. 1285, pending before a subcommittee of the Senate Committee on Commerce, and the Kilgore bill, S. 1297, pending before a subcommittee of the Senate Committee on Military Affairs. As a result of the joint efforts of these two subcommittees, a compromise measure was evolved, S. 1850, which was passed by the Senate on July 3, 1946 after the provision establishing a Division of Social Sciences had been eliminated. No action was taken on this bill by the House of Representatives, and it died with the adjournment of Congress.

This legislation has been reintroduced in the Eightieth Congress. In the Senate, S. 525, introduced by Senator Thomas, Utah, is identical with S. 1850 of the Seventy-Ninth Congress, as that bill passed the Senate. In the House H. R. 942, introduced by Representative Celler, New York, is the same as S. 1850, as that bill was reported to the Senate and includes a provision for a Division of Social Sciences. A third bill has been introduced, S. 526, by Senator Smith, New Jersey, for himself and Senator Cordon, Oregon, Senator Revercomb, West Virginia, Senator Saltonstall, Massachusetts, Senator Magnuson, Washington, and Senator Fulbright, Arkansas. There are four companion bills to the Smith bill pending in the House, H. R. 1815, introduced by Representative Case, New Jersey, H. R. 1830, introduced by Representative Mills, Arkansas, H. R. 1834, introduced by Representative Priest, Tennessee, and H. R. 2027, introduced by Representative Hays, Arkansas. Essentially, then, there are two principal proposals pending, the Thomas bill and the Smith bill.

Both bills provide for the creation of a National Science Foundation in which will be specified divisions and divisional committees. The Thomas bill provides for a one man administrator appointed by the President by and with the advice and consent of the Senate and a National Science Advisory Board also appointed by the President. The Smith bill provides for a foundation composed of forty-eight members appointed by the President by and with the advice and consent of the Senate. The foundation, it is proposed, will elect biennially from its own membership an executive committee of nine members, which in turn will appoint a director of the foundation subject to the approval of a majority of the members of the foundation.

Both bills will authorize such appropriations as may be needed. The Thomas bill specifies a certain minimum percentage of funds to be devoted to research and development in the fields (1) of national defense and (2) of health and medical sciences. The Smith bill has no similar provision. The Thomas bill sets forth specific standards for the disposition of inventions, findings and patent rights. The Smith bill provides that each contract or other arrangement executed by the foundation which relates to scientific research "shall contain provisions governing the disposition of inventions produced thereunder in a manner calculated to protect the public interest and the equities of the individual or organization with which the contract or other arrangement is executed."

It is contemplated that contracts may be made with individuals under the provisions of the Smith bill but not under the Thomas bill. Neither bill provides for a Division of Social Sciences, as does the Celler bill.

As this report is being prepared, hearings are under way on the House bills which were referred to the House Committee on Interstate and Foreign Commerce. The Senate bills are pending in the Senate Committee on Labor and Public Welfare.

Health of School Children.—A Senate joint resolution introduced by Senator Morse, Oregon, S. J. Res. 66, would authorize the Secretary of Labor in cooperation with federal, state and local agencies and qualified institutions of higher education, to (1) make studies of the health and physical status of children of school ages, (2) make studies of the facilities and services offered by schools for the correction of physical defects of children of school ages and (3) recommend the use of and demonstrate in representative urban and rural areas methods of conducting school health examinations and providing school health services. To defray the expenses of the Department of Labor in carrying out the provisions of this joint resolution and providing funds for direct grants by the Secretary of Labor to state departments of health, state departments of education and qualified institutions of higher learning, cooperating with him in carrying out the provisions of the joint resolution, there will be authorized to be appropriated $100,000 for the fiscal year ending June 30, 1947, $450,000 for the fiscal year ending June 30, 1948 and $450,000 for the fiscal year ending June 30, 1949.

Another bill, H. R. 1980, introduced by Representative Howell, Illinois, proposes to enact the "National School Health Services Act of 1947." This bill would make available an appropriation of $12,000,000 for the first fiscal year; $18,000,000 for the second fiscal year and for each succeeding fiscal year such sums as may be necessary to enable the Federal Security Agency, through the Children's Bureau, to cooperate with each state in providing and maintaining school health services for the prevention and diagnosis of physical and mental defects and conditions and, especially in rural areas and in areas suffering from severe economic distress, the treatment of such defects and conditions, including demonstrations and the training of personnel for state and local health services.

A third bill, S. 199, introduced by Senator Aiken, Vermont, would authorize the appropriation of funds to assist the states in more nearly equalizing educational opportunities. Title II of this bill proposes assistance to nonpublic tax-exempt schools of secondary grade or less for necessary transportation of pupils, school health examinations and related school health services, defined to mean services of physicians, dental hygienists, nurses, nutritionists and similar health service personnel employed by the school authorities to provide preventive and diagnostic health services, other than actual medical, surgical or reparative dental treatment.

National Health Bill.—Senator Taft, for himself and Senator Ball, Minnesota, and Senator Smith, New Jersey, introduced in the Seventy-Ninth Congress a bill proposing to enact a National Health Act. It was not anticipated that the Congress would take action on this bill but that it would be studied by the various interested groups with a view to perfecting its provisions. No action was taken on it. The House of Delegates at the San Francisco session in 1946 referred this bill to the Council on Medical Service for study. It authorized the Council, in conjunction with the Bureau, to confer with the sponsors of the bill and report back to the Board of Trustees the results of the conference. As indicated in the report of the Council submitted to the House last December, suggestions as to amendments were sought from state medical associations. Preliminary conferences were held with representatives of the American Hospital Association and of the American Dental Association, following which a meeting with the sponsors of the legislation was held in Washington.

Shortly after the Eightieth Congress convened, a revision of the bill was introduced as S. 545, with Senator Donnell, Missouri, as an additional sponsor. A factual analysis of the new bill has been prepared by the Bureau for publication in an early issue of THE JOURNAL. Elsewhere in this report reference has been made to sections in S. 545 (1) proposing the creation of a National Health Agency and the centralization in it of the activities of the federal government relating to health and (2) authorizing federal funds for the prevention and control of cancer.

Title II of the bill provides, as did the earlier bill, for assistance to the states to enable them to provide general health, hospital and medical services for families and individuals with low incomes. An appropriation of $3,000,000 will be authorized to assist states in making a statewide inventory of existing medical, surgical and hospital care preparatory to the formulation of a plan for extending such care. For each of five fiscal years there will be further authorized an appropriation of $200,000,000 for allotment to the states that have approved plans for providing general health, hospital and medical services for families and individuals with low incomes. Any state desiring to participate in this program may submit a plan to the Director of the Office of Medical and Hospital Care Services. To be approved, such a plan must (1) designate a single state agency as the sole agency for the administration of the plan or designate such agency as the sole agency for supervising the administration of the plan "providing that on or before 1949 such agency shall be the state health agency"; (2) provide for the designation by the governor of a state medical and hospital care advisory council; (3) contain satisfactory evidence that the state agency will have authority to carry out the plan; (4) set forth a statewide program designed and calculated to provide, within five years, (*a*) hospital services, surgical services and medical services for all those families and individuals in the state having insufficient income to pay the whole cost of such, and (*b*) periodic physical examination for all children in elementary and secondary schools in the state. Such a program may, (1) at the option of the state, provide medical care services in institutions, in the home or in physicians' offices; (2) provide for the furnishing of such services to such families and individuals by means of payments in the nature of premiums or partial premiums or reimbursement of expenses or otherwise by the state, to any voluntary health, medical or hospital insurance fund, or other fund, operated not for profit, in behalf of those families and individuals unable to pay the whole cost of such services or insurance therefor; (3) include and take account of services rendered or to be rendered by governmental subdivisions of the state, and by private organizations operating not for profit, and may provide for the payment to such institutions by the state or subdivision for care to such families and individuals; and (4) include payments to physicians practicing in areas which, without such payments, would be unable to provide sufficient income to attract a practicing physician. The program must provide for the collection of proper charges of less than the total cost of such services from persons unable to pay in whole but able to pay in part therefor. A plan must furthermore describe the financial contribution for the support of the plan to be made by the state, its local subdivisions and its private institutions, must set forth the relative need of the various proposals required to carry out the plan and provide for the proper priority between such proposals, must be based on a statewide inventory of existing medical, surgical and hospital care and provide for the making of reports and for the periodic review of the plan by the state agency.

The bill incorporates comparable provisions relating to dental health services, for dental research and concludes by providing that on the direction of any officer or employee of the government of the United States, requesting the government to deduct from the salary of such employee a fixed sum or percentage to be paid to a voluntary health insurance fund, such sum or percentage shall be deducted from the salary and paid as directed by the officer or employee.

This bill thus briefly outlined is pending before the Senate Committee on Labor and Public Welfare, of which Senator Taft is chairman. It is understood that hearings will be scheduled on it to begin sometime during the month of April.

The Hospital Survey and Construction Act.—Section 622 of this act requires that within six months after enactment the Surgeon General shall promulgate regulations describing general policies to be followed in setting up and administering state plans for construction of public and other nonprofit hospitals after such regulations have been approved by the Federal Hospital Council and the Administrator of the Federal Security Agency. These regulations have been promulgated and a condensation of them has been prepared by the Bureau for publication in THE JOURNAL. On the state level, a number of additional states are considering legislation this year so that they will be able to qualify for participation in this construction program. Model state legislation has been formulated by the Council of State Governments and bills following rather closely that model have, to date, been enacted in Arkansas, Tennessee and Virginia and are pending in Arizona, California, Colorado, Connecticut, Delaware, Idaho, Iowa, Montana, Nebraska, New Jersey, New Mexico, Rhode Island, South Dakota, Utah, Washington, Wisconsin and Wyoming.

As pointed out in the report of the Bureau submitted to the House last December, growing out of the enactment of this federal law is a movement to promote the enactment of uniform state hospital licensure laws. The federal law does not require a participating state to enact a hospital licensing law but it does require the enactment by July 1, 1948 of legislation providing that compliance with minimum state standards of maintenance and operation shall be required in the case of hospitals which receive federal aid under the law. Apparently it is felt that this requirement can be more readily complied with by the enactment of a state licensing law in which provision is made for the establishing of adequate standards and through the mechanics of which such standards can be effectively enforced. A model state hospital licensing law has been formulated under the sponsorship of the Council of State Governments. The Assistant Secretary of the Council on Medical Education and Hospitals, the Director of the Washington office of the Council on Medical Service and the Director of the Bureau participated in the formulation of this model bill, which has been submitted to the several states for enactment. Hospital licensing laws have since the first of the year been enacted in Montana, Tennessee, Virginia and West Virginia and are pending in Arizona, California, Delaware, Idaho, Illinois, Iowa, Kansas, Nebraska, Nevada, New Hampshire, New Mexico, North Dakota, Oregon, Texas, Utah, Washington and Wisconsin. Most of this legislation follows closely the model recommended by the Council of State Governments.

Barbiturates.—Congresswoman Rogers, Massachusetts, has reintroduced her bill, as H. R. 588, to bring the barbiturates within the coverage of the federal narcotic laws. The House of Delegates has on a number of occasions recommended that the retail sale of these drugs be limited to sales on prescriptions but that the restriction should be imposed by state rather than federal legislation. The Director of the Bureau has collaborated with the Committee on Legislation of the American Pharmaceutical Association in the development of uniform state legislation to control the over-the-counter sale of the barbiturates, and copies of this legislation may be obtained from the Bureau on request. During the present legislative season, state legislation proposing to limit the sale of barbiturates to sales on prescriptions is being considered in Idaho, Illinois, Maryland, New Mexico, Ohio and South Dakota. The New Mexico bill also includes aminopyrine, cinchophen, sulfanilamide and dinitrophenol and their derivatives. A Delaware bill applies only to penicillin, the sulfonamides and thyroid and their compounds.

Streptomycin.—Legislation has been enacted by the Eightieth Congress (Public Law No. 16) amending the Federal Food, Drug and Cosmetic Act by providing for the certification of batches of drugs composed wholly or partly of any kind of streptomycin or any derivative thereof. This law was enacted at the request of the Federal Security Agency. Prior to its enactment, samples from each batch of streptomycin produced were being tested by the Food and Drug Administration before release for distribution. This service was being carried on through cooperative arrangement with the War and Navy departments, who were purchasing most of the output, and under an order by the Civilian Production Administration operating through the authority of temporary legislation. Since the Civilian Production Administration order was expected to expire shortly, the enactment of the law was necessary. Two other drugs are subject to pretesting and certification, insulin and penicillin.

Medical Aid Act of 1947.—Senator Lodge, Massachusetts, has introduced as S. 678 a bill to provide assistance to the states in furnishing certain medical aid to needy and other individuals. This bill, which will be cited as the "Medical Aid Act of 1947," would authorize an appropriation of such sums annually as may be necessary to carry out its provisions, namely, to enable the several states to provide or to assist in providing certain medical services and medicines, which are standardized in their nature but which because of their high cost are not used in many cases in which their use is desirable. The term "medical aid" is defined to mean making available, free to needy persons and at a minimum cost to other persons, x-ray services, respirators and any drug which is of substantial, accepted and specific value in the treatment or prevention of pneumonia, streptococcic infections, diabetes, pernicious anemia and other anemias, congestive heart failure, glandular and nervous disorders, nutritional deficiency and typhoid and various other infectious diseases. In order to participate in this program, a state must submit a plan for approval by the Surgeon General of the United States Public Health Service.

Industrial Health Hazards.—Representative Norton, New Jersey, has reintroduced her bill as H. R. 475, providing for cooperation with state agencies administering labor laws in establishing and maintaining safe and proper working conditions in industry and in the preparation, promulgation and enforcement of regulations to control industrial health hazards. The House of Delegates in 1945 adopted resolutions in opposition to a similar bill for the reason that it would permit labor departments "to undertake industrial hygiene activities now being done by federal and state public health agencies." A Senate bill, S. 101, introduced by Senator Johnston, South Carolina, for himself and Senator Morse, Oregon, has a title identical with the title of H. R. 475 but does not relate specifically to the control of industrial health hazards in its text.

Animal Experimentation.—Representative Lemke, North Dakota, has reintroduced his bill as H. R. 462, declaring it to be a misdemeanor for any person to experiment or operate in any manner whatsoever on any living dog, for any purpose, except operations normally performed for the convenience of the owner and the welfare or curing of said dog, in the District of Columbia. The antivivisectionists are also active in the legislatures of California, Massachusetts, New York and Wisconsin.

Miscellaneous.—Legislation is pending proposing to revise the Medical Department of the Army, S. 504, introduced by Senator Gurney, South Dakota, and H. R. 1982, introduced by Representative Smith, Maine. This legislation, among other things, would create in the Medical Department of the Regular Army a Medical Service Corps consisting of the Pharmacy Section, the Medical Allied Science Section, the Optometry Section and such other sections as may be deemed necessary by the Secretary of War.

The establishment of a permanent Nurse Corps of the Army and the Navy and of a Women's Medical Specialist Corps in the Army is contemplated by a bill introduced by Representative Smith, Maine, as H. R. 1943. The Women's Medical Specialist Corps will consist of a Dietitian Section, a Physical Therapist Section and an Occupational Therapist Section.

An extension of water pollution control activities in the United States Public Health Service is contemplated by H. R. 123, introduced by Representative Mundt, South Dakota, H. R. 315, introduced by Representative Spence, Kentucky, and H. R. 470, introduced by Representative Elston, Ohio.

Another pending bill, H. R. 496, introduced by Representative Hébert, Louisiana, proposes a program for the rehabilitation of alcoholic addicts and for the medical and scientific treatment of persons found to be alcoholic addicts by the courts of the District of Columbia.

The establishment of a United States Commission on Physical Fitness is proposed by H. R. 220, introduced by Representative Buchanan, Pennsylvania, to promote the physical fitness of the inhabitants of the United States through physical training, competition in all athletic sports, camping and kindred activities.

The enactment of a "Federal Insecticide, Fungicide and Rodenticide Act" is proposed by H. R. 1237, introduced by Representative Andresen, Minnesota.

A bill introduced by Senator Pepper, Florida, as S. 326, proposes to amend the Servicemen's Readjustment Act of 1944 with respect to the education and training of veterans. This bill, among other things, would provide that any veteran who has completed his work while pursuing a preprofessional or professional course would be entitled to such further additional period of education or training as may be necessary to enable him to complete his preprofessional and professional courses, with the limitation that the total period may not exceed nine years.

STATE LEGISLATION

During 1947 the legislatures of forty-four states will meet in regular session. At the time this report is being prepared, forty-two states have already convened, and judging by the number of bills of medical interest that have been introduced so far, it promises to be a busy legislative year. Reference can be made here only briefly to two developments. A more detailed report on state legislation will be prepared after the legislatures have adjourned and will be published in THE JOURNAL.

For many months there has been under way an investigation in Tennessee concerning the manner in which licenses to practice naturopathy have been issued. Apparently a number of irregularities have been discovered and as a result criminal action has been instituted against two members of the state board of naturopathic examiners and against a number of other naturopaths, charging a conspiracy to violate the naturopathic act and the basic science act. This action is pending at the present time.

Following this investigation and apparently because of the conditions disclosed by it, the legislature early this year repealed the naturopathic act and declared of no force or effect all licenses issued under it. Tennessee has thus righted a mistake made in 1943, when the naturopathic act was passed over the veto of the governor. Adherents of this cult are active in a number of other states seeking legislative sanction of their practice, including California, Colorado, Idaho, Indiana, Iowa, New Mexico, Texas, Utah, Washington, Wisconsin and Wyoming.

Shortly after the G. I. Bill of Rights was enacted, the Bureau directed a letter to each state medical association calling attention to the fact that in the federal law were provisions under which veterans could be assisted in pursuing educational courses and cautioning that cult schools might attempt to be certified to the Veterans Administration as qualified to offer educational courses to veterans. Subsequently the Committee on Postwar Medical Service directed a letter to the governor of each state urging the importance of maintaining educational standards, particularly in the field of the healing arts.

As anticipated, accrediting agencies of some of the states have certified schools of chiropractic and of naturopathy, and ex-servicemen are now being enrolled in such schools and are being educated at government expense. It is understood that in one chiropractic school alone about 600 students are enrolled under the G. I. bill. These students are urging that, because they are being assisted financially to pursue their courses by the government, state licensure should be permitted. In a number of states they have importuned veterans' organizations to aid their cause. This is a legislative problem that will remain for many years.

Bureau of Medical Economic Rsearch

The greater part of the report on the Bureau of Medical Economic Research that was presented to the House of Delegates at the supplemental session is included in this report.

At its September 1946 meeting the Board of Trustees changed the name of this Bureau, established in 1931, from the Bureau of Medical Economics to the Bureau of Medical Economic Research and appointed Frank G. Dickinson, Ph.D., as the new Director of the Bureau, succeeding Dr. R. G. Leland. The Board also stated that the Bureau would be reactivated and expanded and that research would be stressed.

In reactivating the Bureau it has been necessary to add to the economic books, pamphlets and bulletins needed for research. Building a library requires a good deal of time. The new director has studied the previous publications of the Bureau and desires to report that he regards them as extremely fine studies. Every week a number of these are mailed in answer to the numerous and varied queries received. Plans were initiated in the fall of 1946 for reviewing and bringing the pamphlets up to date, provided there is a current need for such modification. The Director has worked in close cooperation with the Council on Medical Service, attending its meetings and being a member of its Subcommittee on Cooperation with Insurance Industry in the Development of Prepayment Medical Care Plans and of its Committee on Rural Problems on Medical Care Insurance. The Director addressed the Association of Medical Care Plans at its first annual meeting in October and attended the meeting of its Commissioners in Omaha, November 14 and 15. It is hoped that its organization and the Director of the Bureau working with the Council on Medical Service will be able to develop comprehensive actuarial data on the operations and possible expansion of the different medical care plans in the various states. It will probably be necessary to employ an actuary in the Bureau to perform this function efficiently. An actuary is also needed to help with some of the research program planned by the Bureau.

The staff operating the I. B. M. equipment at Association headquarters was transferred to the Bureau in September, and the Director has devoted a considerable portion of his time to reorganizing this group. He found that the punch card inventory was not adequate and that some pieces of equipment were lacking. The Bureau has been called on to furnish information for several agencies, including the Coal Mines Administration in Washington. This information could not have been furnished without the I. B. M. equipment. It should be stressed that for the most part the Bureau in this capacity acts as a service agency for the Councils at American Medical Association Headquarters, especially the Council on Medical Service, and for local and state medical societies.

Research work, almost completed by Dr. Leland, for the preparation of a life table for physicians which will be presented at Atlantic City by the Statistical Bureau of the Metropolitan Life Insurance Company has been continued. A later study of deaths among physicians during the war period has been started and it is hoped that a fairly comprehensive picture of mortality among physicians during the whole war period can be presented. This study will not be completed before 1948.

The Director has observed that the studies made here and elsewhere on the supply of medical service use county data; that is, the population of a county is divided by the number of physicians in that county, and this ratio is called the physician-population ratio. Economic data do not follow county boundary lines, although the county may be an excellent unit for organizing a professional society. A physician is not a county coroner, and his patients often reside outside the county. The accessibility of medical service has undergone many changes in the last generation, and a study of the supply of medical service must recognize the changes wrought by hard roads and other improvements in transportation. Hence the Bureau is attempting to develop medical service areas which cut across county boundary lines and circumscribe the area served by the physicians in the community. These physician-population ratios for medical service areas, when completed, will indicate the actual supply of medical service to the people in all sections of the United States. It is estimated that it will require at least two years to mark out the entire map of the United States into medical service areas as has been done for retail trading areas by several research organizations. A questionnaire has been sent to the county medical societies which asks the respective secretaries to draw on a state highway map a line around the area served by the physicians located in the medical center of the county. The Bureau hopes that the answers to this questionnaire by the county societies' secretaries will be helpful in preparing the medical service areas of each state.

The Director was asked by the General Manager to assist the Committee on National Emergency Medical Service in the preparation and mailing of a postwar questionnaire to 50,000 discharged medical officers and to code, tabulate and analyze the returned questionnaires. This work has proved to be a much more formidable task than was anticipated. Twenty-six thousand or more questionnaires are being studied.

Bureau of Exhibits

Normal activities in the Bureau of Exhibits were resumed in the first postwar year, with expansion of the work in several lines. The personnel of the Bureau, which had consisted of three persons for many years, was increased to seven, and additional office space was obtained.

THE SCIENTIFIC EXHIBIT

The Scientific Exhibit at the San Francisco session was held in the Civic Auditorium, occupying several small halls and corridors on the first and second floors. The exhibits dramatized the advances made in medicine during the war years, constituting an intensified course in graduate medical instruction. Every available corner was used for one activity or another, and the aisles were crowded beyond their capacity in many parts of the building. In addition, five rooms in the Veterans Building, three blocks distant from the Auditorium, were used for motion pictures.

Section Exhibits.—Active cooperation was maintained with the seventeen sections of the Scientific Assembly, each of which appointed representatives to the Scientific Exhibit.

The section representatives rendered valuable assistance to the Committee on Scientific Exhibit in securing exhibits of exceptionally high caliber and in giving freely of their time and energy throughout the year.

There were 184 applications for space, of which 109, 60 per cent, were accepted. This is a smaller number of exhibits than is usually shown at the annual session, but no more could be accommodated and some excellent material had to be omitted.

United States Army.—It was the desire of Surgeon General Norman T. Kirk, United States Army, to portray at the San Francisco session advances that medicine had made during World War II. The exhibit included thirty-seven subjects relating to medicine in the war. A large group of medical officers was present to act as demonstrators, assisted by enlisted personnel. Lieut. Col. Edward M. Gunn was in charge.

Other activities of the Army included participation in the Special Exhibit on Physical Medicine and maintenance of two motion picture theaters in the Veterans Building.

The Committee on Awards issued a Citation of Merit to the United States Army for these contributions.

United States Navy.—The United States Navy presented a small but spectacular group of exhibits. Dr. Dean F. Smiley was in charge and was assisted by a competent group of medical officers who served as demonstrators.

In addition, the Navy participated in the Special Exhibit on Physical Medicine and showed a group of motion pictures in the Veterans Building.

The Committee on Awards issued a Citation of Merit to the United States Navy for these contributions.

Special Exhibit on Fractures.—This feature of the meeting was presented for the fifteenth time over a period of twenty years. Except for the first two years, Dr. Kellogg Speed has been chairman continuously, and it is due to his initiative and energy that interest has been maintained. There were thirty demonstrators from different parts of the country, with a group of medical students acting as "patients." Continuous demonstrations were conducted in six booths to audiences that strained the facilities of the area to accommodate them. A pamphlet was prepared for distribution.

Special Exhibit on Physical Medicine.—This exhibit was shown for the first time this year under the guidance of Dr. Frank H. Krusen, Rochester, Minn., chairman, Dr. Winfred Overholser and Dr. Howard A. Rusk, assisted by a large group of experts from various universities, insurance companies, the Army, the Navy, the Veterans Administration and the Baruch Committee on Physical Medicine. Other assistants included Army and Navy personnel and medical students.

The exhibit included physical therapy, occupational therapy and rehabilitation, occupying twelve booths. The "live" exhibits of amputees and paraplegics, together with active demonstrations in the other booths, drew audiences far beyond the expectation of the Committee, the second floor hallway being solidly packed with people during the entire week. Motion pictures were shown continuously in a room adjoining the exhibits. A pamphlet was prepared for distribution by the Committee, while numerous pamphlets from other sources dealing with various phases of physical medicine were likewise distributed. The success of the exhibit indicated the interest in this specialty of medicine.

Motion Pictures.—Motion pictures in the Scientific Exhibit were not shown in exhibitors' booths because of the problem created in congestion of the aisles. Special theaters were arranged where the audiences could be seated in comfort. There were forty-eight applications to show motion pictures, of which thirty-eight were accepted. Most of the films had been produced during 1946, many of them being shown in connection with exhibits or with papers read before the sections. Other motion pictures included 37 films shown by the Army, 8 by the Navy and 21 by the Exhibit Committee on Physical Medicine, making a total of 104. Each of the films was shown daily. There were six motion picture theaters each seating 100 to 125 persons. Often the audience far exceeded this number, many persons standing.

Authors were encouraged to comment on their films as they were being shown or to make remarks immediately before or after the showing. The sustained interest of the audiences attested to the popularity of this type of program.

Committee on Awards.—The Committee on Awards consisted of Dr. O. P. J. Falk, chairman; Dr. H. J. Corper, Dr. Leo F. Rigler, Dr. Curtice Rosser and Dr. J. Ross Veal. All the members worked conscientiously and diligently over a period of three days, including two night sessions, and returned a report that received much commendation.

Twenty-three awards were presented: six medals, six certificates of merit, eight honorable mentions, two citations of merit and one special commendation. In addition, the Committee extended itself beyond its regular sphere of activity and awarded a gold medal to the Director of the Scientific Exhibit.

The Committee on Awards has a difficult task in that a large amount of material must be surveyed in a short time. The members must have a broad knowledge of medicine and must be sufficiently well known to command respect. The Association has been fortunate in the caliber of men who have served in this capacity. The knowledge that their decisions are final and not subject to review make them additionally cautious.

Recommendations.—The Committee on Awards recommended that a new medal be prepared for the Scientific Exhibit. It was felt that the present medal, which portrays the features of Dr. Frank Billings, is not symbolic of the spirit of the Scientific Exhibit. It was the opinion of the Board of Trustees, however, that the Billings medal is of historical significance and should not be given up at the time of the Centennial Celebration.

Members of the Advisory Committee of the Scientific Exhibit recommended that a public exposition be held in Atlantic City at the time of the annual meeting to promote public relations and health education. The Committee on Scientific Exhibit investigated the feasibility of the matter and requested an appropriation for expenses, which was granted by the Trustees. The difficulty of obtaining suitable space for such an undertaking, together with numerous other duties of the staff during the Centennial Celebration, made it necessary to postpone the matter to a more propitious time.

Numerous suggestions have been received concerning methods by which a permanent record can be made of the exhibits shown at each annual session. The Committee on Scientific Exhibit voted that photographs be taken showing the detail of especially meritorious exhibits at the Atlantic City session. Copies will be sold to interested physicians.

At various times there have been requests for a pamphlet containing instructions for the preparation of exhibits. The committee on Scientific Exhibit favored a pamphlet that would give basic information, and this will be prepared.

Comments and Remarks.—Numerous encomiums were received at San Francisco concerning the value of the Scientific Exhibit as a factor in graduate medical instruction. The credit, of course, goes to the exhibitors, who gave so freely of their time and effort with no thought of reward. The demonstration of an exhibit for a week at the annual session is almost a superhuman task, straining to the limit the energies of persons who undertake it. The Association is in deep gratitude to such persons.

Centennial Celebration.—Plans for the Centennial Celebration at Atlantic City in 1947 have been given much time and study. Close contact has been maintained with the Council on Scientific Assembly and with the sections, each of which has appointed a representative to the Scientific Exhibit. Arrangements have been made for four special exhibits, together with a considerable amount of historical material. These features, added to the numerous applications for space from individual physicians, and the motion pictures which are contemplated, will make the Scientific Exhibit at Atlantic City the most striking one in the history of the Association.

ASSOCIATION EXHIBITS

The Association exhibits depict the work of the various Councils and Bureaus of the Association Headquarters on subjects in which those departments are interested. About forty exhibits are maintained for loan purposes, some of which are used for medical meetings and other scientific groups, while the remainder are used for fairs and expositions. During the year several old exhibits were discarded because they were no longer serviceable; others are in the process of repair and rebuilding. Lack of personnel in many of the departments has retarded the building of contemplated exhibits, while the difficulty of obtaining materials has still further delayed the program. New subjects already completed include "The Ten Point Program," "Hormones," "Electrically Transcribed Program for County Medical Societies," "Trichinosis" and "Amebiasis." Other exhibits which will soon be ready include "Tuberculosis" and "Industrial Health."

Difficulties in transportation and housing during the abnormal times following the war have interfered with participation in many meetings. A considerable number of requests for exhibits were canceled because of these reasons. During the year, however, one hundred exhibits were sent to fifty-three meetings in twenty-five states and the District of Columbia. There were twenty-four medical and scientific meetings which used thirty-eight exhibits, each accompanied by a member from the headquarters staff. The Director of the Bureau of Exhibits attended many of the meetings personally. The time consumed in such work is considerable because the attendant must arrive before the meeting opens and remain at his task until the close. The results are worth the effort, however, since a much more intimate contact is made with the members of the respective organizations through the exhibit than could be made by a speaker on the regular program.

Fairs and expositions which were canceled during the war opened again in 1946 to a considerable extent. Sixty-two exhibits were lent to twenty-nine local groups in many different states. The opportunity for contact with the public through health exhibits in promoting better public relations is excellent. The Woman's Auxiliary of the Medical Society of Milwaukee County promoted a Health Week with gratifying results in connection with the centennial celebration of the society.

MUSEUMS

Health exhibits have been maintained in the Chicago Museum of Science and Industry, in the Cleveland Health Museum and in the Toledo Museum of Science. A large group of exhibits was lent to the Dallas Health Museum which opened in October, and the offer of cooperation has been extended to the proposed San Diego Health Museum. Other museums using the facilities of the American Medical Association include the Newark Museum at Newark, N. J., and the Cayuga Museum of History and Art at Auburn, N. Y.

A question and answer service has been a feature at several of the museums, with the questions answered by mail from the Bureau of Health Education. The questions have become so numerous, however, that the service has been temporarily curtailed.

The opportunity for health education in institutions such as museums should not be overlooked. Visitors come in a receptive mood and many thousands of people are reached annually from all social levels.

COMMITTEE ON MEDICAL MOTION PICTURES

The American Medical Association has been actively interested in medical motion pictures for many years. In 1928 and again in 1930 the House of Delegates appointed committees to study the problem. The Bureau of Exhibits developed a source file of motion pictures and has maintained a small film library for the past fifteen years. In 1945 the Board of Trustees, at the instigation of the Committee on Scientific Exhibit, appointed a Committee on Medical Motion Pictures to make suggestions and report back to the Board. At the San Francisco session the Trustees accepted the recommendations and appointed the following committee: Dr. W. L. Benedict, Chairman; Mr. John G. Bradley, Dr. Morris Fishbein, Mr. Thomas S. Jones, Dr. Dean F. Smiley and Mr. Ralph P. Creer, Secretary.

The purpose and scope of this committee is outlined briefly as follows:

1. To promote a more widespread and effective utilization of medical motion pictures and to stimulate research in this field.

2. To expand the present library of medical and public health films now available on a loan basis through the American Medical Association. Motion pictures dealing with basic subjects that are not available through other sources will be selected. Additional copies of the most popular prints in the present library will be purchased so that a wider and more rapid distribution will be possible.

3. To publish critical reviews of medical motion pictures in THE JOURNAL and HYGEIA from time to time. These reviews will include a brief description of the film content, a professional and technical appraisal, a comment as to the recommended audience level and a note regarding the availability of the films. Current news items of interest to the medical profession as well as comments on the intelligent use of motion pictures will also appear in THE JOURNAL.

4. To expand the source file which has been started. Eventually this file will contain informative data on motion pictures dealing with all phases of medicine as well as health films for the public. Films not available for loan or purchase will not be listed. The purpose of this file is to provide on request authentic information relative to the types of films available to the medical profession on any given subject.

The Committee has acquired a projection room for reviewing films adjacent to its office at Association headquarters. Reviews of medical motion pictures have been published in THE JOURNAL and the source file of films has been expanded. The film library, formerly located in a professional studio, has been brought to the headquarters building, making possible a more efficient handling of films. This library is still small, but from time to time additions of films that are of a basic nature will be made. The demand for films from medical schools, medical societies, hospitals and other organizations continues to increase. During the year, 1,042 films were sent out.

A questionnaire has been sent to all medical schools in the United States and to state and county medical societies to obtain information concerning their facilities for showing films and concerning the subjects of films that would be most useful in medical schools and medical societies. The response to date is gratifying.

The Secretary of the Committee has kept in close touch with other groups interested in medical films and has attended many committee meetings of those groups.

MISCELLANEOUS ACTIVITIES

Numerous conferences have been held on matters pertaining to graduate medical instruction and health education by visual means. Visitors have come from all parts of the United States as well as from the Latin American countries and other parts of the world.

Members of the staff have collaborated with other agencies, serving on various boards and committees, such as the National Advisory Committee of the Cleveland Health Museum, the Committee on Exhibits of the Society of Illinois Bacteriologists, the Council of the Section on Health Education of the American Public Health Association, the Advisory Committee on Health Education of the Tuberculosis Institute of Chicago and Cook County, and the advisory staff of the Veterans Administration. The Director of the Bureau also has maintained his position as assistant professor of bacteriology and public health at the University of Illinois College of Medicine.

The publications sponsored by the Bureau have continued to be popular, especially the Primer on Fractures, which is in its fifth edition, and Fundamentals of Anesthesia, in its second edition. Various mimeographed outlines prepared for distribution with exhibits have had a wide circulation.

Bureau of Information

The Bureau of Information, working closely with the Council on Medical Service, is developing programs aimed toward a more adequate and even distribution of medical personnel and facilities throughout the United States.

The Bureau is making a concentrated effort to guide physicians to locate in areas where their services are most needed. Through the cooperation of the state medical associations, current listings are available of every area in the country where there is a need for a physician. In December 1946 the Bureau began a survey through the local medical societies to determine the conditions and distribution of medical care in the rural areas of the country and the recent movements of physicians into rural areas. Data from three fourths of the counties have been received and are being tabulated and recorded to be used in recommendations for the extension of medical care to all communities.

The Bureau of Information, together with the Council on Medical Service, is cooperating with the Committee on Rural Medical Service of the American Medical Association in stimulating and coordinating the work of the various groups interested in better rural medical service. The Bureau assisted the Committee in arranging the second annual meeting of the National Conference on Rural Health on Feb. 7 and 8, 1947. This conference was attended by over three hundred leaders of the various farm, educational, health and medical groups throughout the United States. Eight thousand reprints of the proceedings of this conference are being distributed to individuals and organizations interested in better rural health. The resolutions from this meeting are being carefully considered in a working plan formulated by the Bureau of Information and the Council on Medical Service for the extension of better medical care through a better distribution of medical personnel and facilities.

The Bureau is working out a cooperative program with the Division of Hospital Facilities of the United States Public Health Service. The Hill-Burton law, supporting the survey and construction of hospital, health and diagnostic centers throughout the nation, is one measure aimed at developing facilities in areas where they are unavailable and cannot be supplied through local or state agencies.

The director of the Bureau of Information, through the Council on Medical Service, is cooperating closely with the American Academy of Pediatrics in developing the idea of child health centers. A resolution recently passed by the executive board of the academy advised the Council on Medical Service that it would be desirable to have the director of the Bureau of Information work closely with the Committee for Improvement of Child Health of the American Academy of Pediatrics and the representative of the Section on Pediatrics of the American Medical Association in the development of a plan having to do with child health centers and the child care program of the American Medical Association.

In cooperation with the Bureau of Health Education and the Council on Medical Education and Hospitals, the Bureau of Information has participated in two television programs, the first on rural health and the second on child health centers.

During the past three years the Bureau of Information has been able, through correspondence and personal interviews, to offer a guiding hand to the returning medical officer and help him in his problems of readjusting to civilian practice. The Bureau of Information will present a historical exhibit at the Centennial Celebration of the American Medical Association at Atlantic City.

Office of Executive Assistant

The Office of the Executive Assistant was created to function under the Secretary and General Manager for the purpose of coordinating and servicing the public relations activities of the American Medical Association with the medical profession and the public. After a period of orientation in the headquarters of Raymond Rich Associates, Mr. Charles M. Swart reported for duty as head of the department on Nov. 25, 1946. The staff of the Office, aside from the Executive Assistant, consists of a secretary, a staff writer and an editorial assistant in charge of preparation of the Secretary's News Letter. The former Bureau of Public (Press) Relations, with its staff of a director, junior writer and secretary, was transferred to the Office of the Executive Assistant the latter part of January.

The initial period of operation of the new office has been characterized primarily by study of existing operations at Association headquarters and in the field, preparation of a long term public relations program for the Association and the medical profession, selection of staff to implement the initial stages of the program and consolidation of the press relations department into the operation.

SECRETARY'S NEWS LETTER

One of the first activities inaugurated was the weekly publication of an informal news letter, signed by the Secretary and General Manager, containing brief reports of work in progress and contemplated at Association headquarters by the several councils, bureaus and departments. First distributed to officials at headquarters, general officers of the Association and members of the House of Delegates and Board of Trustees, circulation was later extended to the members of the various Association councils, officers of constituent state medical associations and other key medical leaders. Since the first of January 1947, circulation has increased to some 2,600 medical leaders throughout the country. Where comment has been volunteered from those receiving the News Letter, it has been favorable.

PUBLICATIONS

Research has been completed and writing is under way on a pamphlet authorized by the Board of Trustees to describe the functions of the American Medical Association in terms of the benefits derived by the members of the medical profession and the public. A handbook and directory of the official family of the American Medical Association also is being prepared for publication and primarily will be distributed to newly enrolled Fellows.

COORDINATION AND SERVICE AT HEADQUARTERS AND FOR CONSTITUENT AND COMPONENT SOCIETIES

Although a substantial start has been made toward coordination and service of public relations activities within the several councils, bureaus and departments in the headquarters offices, the necessary period of orientation and planning has detracted from time available for this purpose. It should be possible during the coming year to increase greatly the amount of time available for coordination of activities of other departments.

Considerable time has been spent in the initial two and one-half months of operation in determining the need for coordination and service to state and county medical societies in public relations programs. An informal meeting of state medical association public relations representatives and executives was held in Chicago in February. Spontaneous round table discussion among representatives from all parts of the country emphasized a desire to have advice and leadership in determining overall trends and policies for public relations programs; a centralized source for information, materials and suggestions for increasing the effectiveness of their own efforts; a continuing channel for exchange of information, material and experience, and an advisory service on specific problems of a local nature. A public relations bulletin is under preparation for periodic circulation among state medical association executives and public relations and other medical society personnel who may find it useful. Plans are being completed for a proposed public relations section in connection with the county medical society officers' conference to be held at the time of the Centennial Celebration in Atlantic City. Programs of other national organizations for implementing public relations activities at state and county levels are being reviewed, and proposals will be made for providing aid and implementation.

PROMOTION FOR COUNCIL ON MEDICAL SERVICE

Extended conferences have been held with the headquarters staff and members of the Council on Medical Service in connection with the need for providing coordination and service in prepayment medical service plans throughout the country.

PRESS SECTION

In the past year, as in previous years, the director of press relations and his staff have written and edited the AMERICAN MEDICAL ASSOCIATION NEWS, a weekly clip sheet for distribution to newspapers, radio broadcasting stations and magazines. Material in this publication has been widely used by the more than 1,000 editors on the mailing list. The value of this service may be indicated by the returns on a questionnaire sent to those who have received the clip sheet in the past. The immediate purpose of the questionnaire was to bring the names and addresses on the mailing list up to date. However, comment on its usefulness was invited. Some of the typical remarks carried on the returned cards were: "Fine subject matter, caliber and handling, excellent for our readers," from an insurance publication; "You are doing one of the best public relations jobs of any organization," from an editor of a national newspaper syndicate; "We frequently refer to your interesting and timely comment on vital medical subjects," from an industrial house organ editor; "Your releases constitute an important part of the source material for our daily transcribed radio program," from a state medical association, and "We find the A. M. A. NEWS very helpful," from a science editor of a national press association.

In addition to the publication of the A. M. A. NEWS, the press section has handled hundreds of inquiries from newspapers, magazines, radio science editors and free lance writers on various medical subjects.

Bureau of Industrial and Personnel Relations

The Bureau of Industrial and Personnel Relations, an entirely new office at Association headquarters, became effective Jan. 1, 1947. Mr. T. V. McDavitt, for the past eighteen years associated with the Bureau of Legal Medicine and Legislation, was appointed Director of the new bureau.

The need for such a bureau has become apparent in the past few years. The enactment and enforcement of certain federal and state statutes, changing economic conditions and sociologic concepts have stressed the importance of the personnel factor in the operation of any activity. The field of personnel management—the managerial aspect of industrial and personnel relations—is simply one field of the general field of management, which in the last analysis involves the rational and equitable utilization of personnel and materials to obtain a given objective. The technics of this field are not as yet the technics of a science, precise and susceptible of exact proof. Successful managerial direction of personnel relations is not an achievement to be obtained in a day. It is a development that necessitates painstaking consideration over a period of years. Depending primarily, as it does, on general recognition of the soundness and fairness of managerial policies by employees who are largely uninformed as to management's problems, successful administration of personnel relations requires an extensive period of honest, effective interpretation as well as the actual adoption of appropriate personnel practices. Management must first of all conceive and adopt a sound personnel practice, and then it must convince employees of the soundness of that practice.

The development of fundamentally sound personnel relations is a long-time permanent program rather than a sudden achievement. Essentially, it depends on continuous analysis and appraisal, adjustment and readjustment of personnel policies, coupled with constant, effective interpretation of these policies to the entire employed personnel of the Association.

Committee on Rural Medical Service

The Committee on Rural Medical Service in cooperation with the four principal organized farm groups sponsored the second National Conference on Rural Health, Feb. 7 and 8, 1947. Some 350 participants came from nearly every state in the Union.

The conference was organized to permit and stimulate participation by all attending. The six study groups were well attended. The discussions were contributed by a large number of those attending and represented nearly all shades of opinion. This freedom of expression, not necessarily in harmony with the host group, was a large contributing element in the satisfaction and approval voiced later by many.

It was not feasible to study all phases of the health problem at that time, so the following subjects were selected:

1. Hospital Facilities and Health Centers.
2. Methods of Bringing and Holding Physicians and Dentists in Rural Areas.
3. Voluntary Medical Prepayment Plans.
4. Nursing Needs of Rural Communities.
5. Health Council as Agency for Promoting Rural Health.
6. Medical Care for Lower Income Groups.

After formal discussion of some of these subjects, the six committees conducted their discussions in the afternoon where all attending were expected to, and did in large measure, present their views in open meeting. Through the mass of material gleaned from these many and at times divergent points of view the committees formulated conclusions which were presented before the whole conference for further discussion. It is worthy of note that committees working on different subjects came to approximately comparable conclusions in many instances. There is increasing evidence of the interest of rural people in prepaid medical and hospital plans. Adjustment of these plans to meet the peculiar needs of rural people is urgent and imperative. In developing these plans on a community or trade area basis, ways should be found for including coverage of the medically indigent. A full report of the conference has been printed in The Journal of the American Medical Association.

Following the close of the conference, the delegates from the rural medical service committees of the state medical associations met to discuss progress achieved during the past year and plans for future developments. This was a very important part of the conference but, owing to the short time available, no state committee found it possible to give an adequate recital of progress made during the past year. To remedy this, each state chairman will be requested to submit a report in full. It is hoped that these reports can be received in November of this year and published in a handbook for general distribution.

In view of the findings of the conference, the Committee on Rural Medical Service proposes as one of the objectives for this year the creation of health councils on the county or trade area basis, whose activities should include:

First, survey and analysis of all factors of the local health problem, such as earning capacity and opportunity, housing, food and clothing, roads and transportation, churches and schools, public health services, medical, dental and nursing personnel, hospitals and diagnostic facilities, local or within reach, and health education activities.

Secondly, the mobilization of volunteer personnel for training and use in first aid, emergency and bedside nursing in the rural areas during the present unavailability of registered nurses.

To stimulate interest in the year's program, the committee is engaged in organizing regional conferences of groups of states having common rural problems. These conferences should do much to stimulate state conferences which would eventually carry out the important work of forming health councils on the local or trade area basis.

On authorization of the Board of Trustees, invitations have been sent to the American Farm Bureau Federation, the National Grange, the Farmers Educational and Cooperative Union and the National Cooperative Milk Producers Federation to appoint representatives to act in an advisory capacity with this committee.

During the past year the committee has been expanded so that each area of the United States becomes the responsibility of a committee member residing in the area.

If experience in 1947 seems to justify it, a third national conference may be called.

Respectfully submitted,

F. S. Crockett, Chairman.
E. J. McCormick.
Victor Johnson.
C. W. Roberts.
L. W. Larson.
Fred A. Humphrey.
Carll Mundy.
N. H. Gardner.
J. Paul Jones.
H. B. Mulholland.
Allen T. Stewart.
James F. Doughty.
George F. Lull.

Conference of County Medical Society Officers

At the supplemental session in December 1946 a resolution was introduced sponsoring a national conference of officers of component county medical societies. This resolution was referred to the Reference Committee on Legislation and Public Relations, which recommended that it be referred to the Board of Trustees for study and consideration as to the feasibility and value of such a conference, with power to act. After due deliberation the Board was of the opinion that, if a conference was to be called, it should be called at the time of the annual session and therefore decided to call the conference for Sunday, June 8, 1947 at Atlantic City. Dr. A. M. Mitchell of Terre Haute, Ind., a county medical society secretary for many years, will act as chairman of the conference.

American Red Cross Blood Program

Two representatives of the American Red Cross appeared before the Board of Trustees at its meeting on Feb. 20, 1947 relative to the establishment of a national blood program by the Red Cross. These representatives had appeared on the previous day before the Executive Committee. The proposed *program is concerned with the establishment on a national basis* of a system for furnishing whole blood and blood derivatives throughout the country. The Board of Trustees agreed to recommend approval in principle of the Red Cross plan for the establishment of a national blood program with the understanding that the operation should be maintained on a community level with the approval of the county medical societies concerned. The matter is referred to the House of Delegates.

World Medical Association

The Board of Trustees has been in communication with a group of European medical societies that are attempting to form a World Medical Association. During the past year the organization passed out of the formative stage, and the American Medical Association was invited to participate. After due consideration the Board accepted the invitation on behalf of the American Medical Association. A meeting of the Organization Committee of the World Medical Association was held in London, England, in April 1947 for the purpose of preparing a constitution and by-laws. The American Medical Association was represented at that meeting by two members of the Board of Trustees.

Actions with Reference to Committees

After due consideration, the Committee to Study Air Conditioning was discharged by action of the Board of Trustees at its meeting in February 1947.

Pursuant to a resolution on closer cooperation between the medical and dental professions, which was referred by the House of Delegates at the supplemental session to the Board of Trustees for consideration and study, the following committee was appointed by the Board: Dr. E. L. Henderson, Dr. Ernest E. Irons, Dr. William F. Braasch, Dr. Louis H. Bauer and Dr. George F. Lull. The American Dental Association has appointed a similar committee.

A committee on Veterans Medical Problems, to serve as liaison with the Veterans Administration, has been appointed. Its members are Dr. R. L. Sensenich, Dr. Herbert H. Bauckus, Dr. Edgar P. McNamee, Dr. H. H. Shoulders and Dr. George F. Lull. This committee is acceptable to the Veterans Administration.

Conclusion

All matters that have been referred to the Board of Trustees have received official consideration. There may be items which will be brought to the attention of the Board between the time of preparation of this report and the annual session in Atlantic City, and if necessary a supplementary report will be presented to the House of Delegates.

Respectfully submitted,

R. L. Sensenich, Chairman.
Ernest E. Irons, Secretary.
Dwight H. Murray.
William F. Braasch.
Louis H. Bauer.
Elmer L. Henderson.
John H. Fitzgibbon.
James R. Miller.
Charles W. Roberts.

ADDENDA TO REPORT OF BOARD OF TRUSTEES

Report of the Committee on Scientific Research for 1946

Sixteen new grants were made, amounting to $14,524 50. Ten grants were closed. Work is in progress under twenty-four grants In most cases work suspended on account of the war has been resumed

The committee recommends that for 1947 $12,550 be appropriated for grants in aid of medical research and $1,200 for the expenses of the committee.

The financial statement for 1946 is presented, also lists of grants pending and closed.

Respectfully submitted,

Committee on Scientific Research of
the American Medical Association.

Ludvig Hektoen, Chicago.
Term expires, 1951.
Martin H. Fischer, Cincinnati.
Term expires, 1950.
N. W. Jones, Portland, Ore.
Term expires, 1949.
John J. Morton, Rochester, N. Y.
Term expires, 1948.
E. W. Goodpasture, Nashville, Tenn.
Term expires, 1947.

GRANTS OF COMMITTEE ON SCIENTIFIC RESEARCH

New Grants—1946

Grant 692: Wesley Spink, University of Minnesota, $500, brucellosis.

Grant 693: Catharine Macfarlane, Women's Medical College of Pennsylvania, $1,774.50, value of periodic pelvic and breast examinations for cancer.

Grant 694: L. R. Cerecedo, Fordham University, $600, vitamin B deficiencies in rats and mice.

Grant 695. Reuben Mokotoff, Montefiore Hospital, New York, $900, relation to edema of renal clearance in congestive heart failure.

Grant 696: James H. Leathem, Rutgers University, $500, antihormones.

Grant 697: George Sayers, University of Utah, $1,000, pituitary adrenocorticotropic activity.

Grant 698· Paul F. Hahn, Vanderbilt University, $500, radioactive manganese in Hodgkin's disease, leukemia, lymphoma, etc.

Grant 699: Bernard N. E. Cohn, National Jewish Hospital, Denver, $250, experimental bone tuberculosis

Grant 700 Harold J. Harris, New York, $2,600, diagnosis and treatment of brucellosis

Grant 701: Rollin A. Daniel Jr. and F. T. Billings, Vanderbilt University, $250, atabrine in the treatment of tuberculosis.

Grant 702: Hans Popper, Cook County Hospital, Chicago, $1,000, morphology of the liver in relation to function (Brant Fund).

Grant 703: Frederick H. Howard, Lincoln Hospital, New York, $600, vectocardiographic research

Grant 704: Archie R Tunturi, University of Oregon, $600, acoustic system of the dog

Grant 705: Hovey Jordan, University of Vermont, $450, project method in the teaching of histology.

Grant 706: Rachmiel Levine, Michael Reese Hospital, Chicago, $1,000, secretion and metabolism of progesterone in threatened abortion.

Grant 707: A. M. Lassek, Medical College of the State of South Carolina, $2,000, degenerative phenomena in the pyramidal tract.

STATE OF GRANT-AIDED WORK

1. Grants Closed During 1946

Grant 613, 1941: Robert W. Virtue, University of Denver, $200, formation of cholic acid. See grant 499, 1938, report for 1940. Virtue, Robert W.: Production of Cholic Acid by the Rat, *Federation Proc.* **1**: 139, 1942.

Grant 662, 1943: Katharine M. Howell and Elta Knoll, Michael Reese Hospital, Chicago, $750, amebic dysentery. Howell, Katharine M., and Knoll, Elta· Studies on Dientameba Fragilis: Its Incidence and Possible Pathogenicity, *Am. J. Clin. Path.* **15**: 178, 1945; Howell, Katharine M., and Knoll, Elta W.: Multiple Intestinal Parasitic Infections, *J. Am. M. Women's A.* **1**: 203, 1946. Knoll, Elta W., and Howell, Katharine M.: A Study of the In Vitro Effect of Penicillin on Endameba Histolytica, *Arch. Path.*, accepted for publication.

Grant 671, 1944: A. M. Lassek, Medical College of State of South Carolina, $1,000, effect of paralysis on human pyramidal system. See grants 632, 1942, 655, 1943 and 707, 1946. Lassek, A. M.: The Human Pyramidal Tract: X. The Babinski Sign and Destruction of the Pyramidal Tract. *Arch. Neurol. & Psychiat.* **52**: 484, 1944; The Human Pyramidal Tract: XI. Correlation of the Babinski Sign and the Pyramidal Syndrome, *ibid.* **53**: 375, 1945. Lassek, A. M., and Evans, J. P.: The Human Pyramidal Tract: XII. The Effect of Hemispherectomies on the Fiber Components of the Pyramids, *J. Comp. Neurol.* **83**: 113, 1945. Lassek, A. M.: The Human Pyramidal Tract: XIII. A Study of the Pyramids in Cases of Acute and Chronic Vascular Lesions of the Brain, *Arch. Neurol. & Psychiat.* **54**: 339, 1945; The Pyramidal Tract; the Representation of the Lateral Corticospinal Component in the Spinal Cord of the Cat, *J Neuropath. & Exper. Neurol.* **5**: 72, 1946. Lassek, A. M., and Hard, Walter L.: The Pyramidal Tract: The Relation of Axonal Diameters to the Rate of Degeneration as Revealed by the Acid Phosphatase Method in the Monkey, *ibid.* **5**: 374, 1946. Hard, Walter L., and Lassek, A. M.: The Pyramidal Tract; Effect of Maximal Injury on Acid Phosphatase Content in Neurons of Cats, *J. Neurophysiol.* **9**: 121, 1946. Lassek, A. M. and Evans, Joseph P.· The Human Pyramidal Tract: XIV. A Study of the Representation of the Corticospinal Components in the Spinal Cord, *J. Comp. Neurol.* **84**: 11, 1946. Lassek, A. M.: The Pyramidal Tract; The Sensitivity of Axons to Maximal Injury of Cells of Origin in the Cat, *ibid.* **84**: 133, 1946.

Grant 674, 1944: David J. Sandweiss and Thomas L. Patterson, Wayne University College of Medicine, $750, relation of the endocrine glands to urogastrone. See grant 691, 1945. Kaulbersz, J.; Patterson, T. L.; Sandweiss, D. J., and Saltzstein, H. C.: The Relation of Endocrine Glands to the Gastric Secretory Depressant in Urine (Urogastrone), Science, accepted for publication. Kaulbersz, J.; Patterson, T. L.; Sandweiss, D J., and Saltzstein, H C. The Relation of Endocrine Glands to the Gastric Secretory Depressant in Urine (Urogastrone), *ibid.* **102**: 530, 1945.; Endocrine Glands and Gastric Secretion, *Federation Proc.* **5**: March 1946. C.: The Influence of Different Urine Extracts on Gastric Secretion Obtained from Dogs Following Extirpation of Certain Endocrine Glands, *Canad. M. A. J.* **54**: 69, 1946.

Grant 676, 1944· Frederick M. Allen, New York, $500, studies on refrigeration surgery and treatment. See grant 657, 1943. Allen, Frederick M.: Spontaneous and Induced Epileptiform Attacks in Dogs, in Relation to Fluid Balance and Kidney Function, *Am. J Psychiat.* **102**: 67, 1945. Allen, Frederick M.; Crossman, L W, and Lyons, L V. Intravenous Procaine Analgesia, *Anesth. & Analg* **25**: 1, 1946.

Grant 678, 1944: Herbert S Kupperman, University of Georgia, $500, pregnancy test. Kupperman, Herbert S, and Greenblatt, Robert B: The Two Hour Pregnancy Test, *South M J* **39**: 158, 1946

Grant 683, 1944: O. Boyd Houchin, Loyola University Medical School, $350, vitamin E deficiency in relation to cardiac function. Refund $114.97. Gatz, Arthur J., and Houchin, O. Boyd: The Histology of Vitamin E Deficient Rabbit Hearts, *Anat Rec* **94**, March 1946

Grant 684, 1944: Rachmiel Levine, Michael Reese Hospital, Chicago, $1,000, secretion and metabolism of progestrone in threatened abortion. See grant 706, 1946. Guterman, Henry S.: Further Observations on the Value of the pregnandiol Test for Pregnancy, *J. Clin. Endocrinol.* **5**: 407, 1945; Prediction of Fate of Threatened Abortion by Pregnandiol, J. A. M. A. **131**: 378, 1946

Grant 688, 1945. A R. Tunturi, University of Oregon Medical School, $300, effects of masking tones on the responses in the cerebral cortex to pulses of pure tones See grant 704, 1946 Tunturi, Archie R. A Study on the Pathway from the Medial Geniculate Body to the Acoustic Cortex in the Dog, *Am. J. Physiol.* **147**: 311, 1946

Grant 697, 1946: George Sayers, University of Utah, $1,000, pituitary adrenocorticotropic activity. Sayers, George: A Rapid and Sensitive Method for the Assay of Pituitary Adrenocorticotropic Hormone, *Endocrinology*, in course of publication.

2 Work in Progress, 1946

Grant 479, 1937: Tracy, J Putnam, Boston City Hospital, $200, injuries to the cervical portion of the cord This research was suspended during the war

Grant 504, 1938: Wallace M. Yater, Georgetown University Medical School, $500, histopathology of "bundle branch" block.

Grants 518, 1938, and 559, 1939: Harold D. West, Meharry Medical College, $150, synthesis of *dl* threonine.

Grant 570, 1940. William H Sweet, University of Chicago, $300, course of nerve fiber tracts of the temporal lobe.

Grant 582, 1940: Charles W. Greene, Stanford University, $500, physiology of the coronary system in monkeys. Refund $160.48.

Grant 584, 1940: Oscar V. Batson, University of Pennsylvania, $200, nystagmus.

Grant 605, 1941: Harry G. Day, Indiana University, $400, physiologic significance of zinc. Active research was suspended during the war.

Grant 607, 1941: Fritz Levy, Davis Memorial Hospital, Elkins, W. Va., $250, study of marrow cells. Levy, Fritz: Megakaryocytes and Blood Platelets, *Am. J. Clin. Path.* **15**: 154, 1945.

Grant 616, 1941: Robert S. Dow, University of Oregon Medical School, $250, effects of clotting in cerebral veins. See grant 566, 1940.

Grant 626, 1942: Peter P. H. de Bruyn, University of Chicago, $400, study of osteogenic substance in laying birds.

Grant 643, 1942: Milton Mendlowitz, Mount Sinai Hospital, New York, $500, digital circulation (Special Cardiac Research Fund).

Grant 650, 1942: Tuberculosis Committee, Minnesota State Medical Association, J. A. Myers, chairman, $1,000, tuberculosis survey of Meeker County, Minn.

Grant 656, 1943: Warren O. Nelson, Wayne University, $300, lipids in the adrenal cortex. Refund $133.08. See grant 481, 1937.

Grant 661, 1943: Roland K. Meyer, University of Wisconsin, $500, antihormones, McShan, W. H.; Wolfe, Harold R., and Meyer, Roland K.: Factors Affecting the Action of Antigonadotropic Sera in Immature Rats, *Endocrinology* **33**: 269, 1943. Wolfe, Harold R.; Meyer, Roland K., and McShan, W. H.: The Negative Phase in the Antigonadotropic and Precipitin-Productive Activities in Rabbits, *J. Immunol.* **50**: 349, 1945.

Grant 670, 1944: Wilbur Thomas, Bowman Gray School of Medicine, $300, experimental cardiac rupture.

Grant 677, 1944: J. LeRoy Conel, Harvard Medical School, $500, postnatal development of the human cerebral cortex (Charles A. Brant Fund).

Grant 679, 1944: Theodor E. Bratrud, University of Minnesota Medical School, $600, colored illustrations for article on congenital adrenal hyperplasia.

Grant 681, 1944: W. E. Garrey, Vanderbilt University School of Medicine, $500, innervation of the heart of vertebrates.

Grant 682, 1944: Helen Ingleby, Woman's Medical College of Pennsylvania, $500, problems of cystic disease and carcinoma of the breast.

Grant 685, 1944: Daniel J. Glomset, Des Moines, Iowa, $500, cardiac conduction. See grant 629, 1942. Glomset, Daniel J., and Birge, Richard F.: A Morphologic Study of the Cardiac Conduction System: IV. The Anatomy of the Upper Part of the Ventricular Septum in Man, *Am. Heart J.* **29**: 526, 1945.

Grant 687, 1945: Barnett Sure, Arkansas Agricultural Experiment Station, Fayetteville, $600, effect of sulfonamides on thiamine and riboflavin metabolism.

Grant 689, 1945: Israel S. Kleiner and Arnold H. Schein, New York Medical College, $400, nutritive value of intact protein compared with the products of its enzymatic and acid hydrolysis.

Grant 690, 1945: Leo L. Hardt, Loyola University School of Medicine, Chicago, $250, improvements of flexi-rigid gastroscope. See grant 673, 1944.

Grant 691, 1945: David J. Sandweiss, Thomas L. Patterson and Harry C. Saltzstein, $1,200, relation of the endocrine glands to gastric secretion. See grant 674, 1944.

Committee on Therapeutic Research

The Committee on Therapeutic Research, a standing committee of the Council on Pharmacy and Chemistry, encourages scientific investigations in the field of therapeutics by providing funds for the prosecution of necessary research.

During the year 1946 the Committee issued twenty-five grants. A detailed list of these grants, together with a list of publications during 1946, and of unexpended grants made before Jan. 1, 1946, will be found in the appendix to this report.

During 1946 the following grants were issued:

Grant 558: Howard Glass, Department of Pharmacology, Marquette University School of Medicine, the comparative effect of Demerol and morphine on the resistance of anoxia of rabbits from the onset of viability to adult life, $250.

Grant 559: Richard C. de Bodo, associate professor of pharmacology, New York University College of Medicine, the role of gluconeogenesis and carbohydrate utilization in insulin hypersensitivity, $500.

Grant 560: Fred D. Weidman, professor of research in dermatology and mycology, University of Pennsylvania School of Medicine, Torula histolytica, $500.

Grant 561: G. L. Cantoni, assistant professor of pharmacology and physiology, Long Island College of Medicine, the mechanism whereby potassium exerts its effect on the intact smooth muscle, $400.

Grant 562: Grace E. Wertenberger, assistant professor of physiology, Woman's Medical College of Pennsylvania, cardiac physiology as revealed by the electrocardiogram during serum sickness and sulfonamide hypersensitivity reactions, $500.

Grant 563: Gregory Pincus, director of laboratories, Worcester Foundation for Experimental Biology, standardization of chorionic gonadotropin, $1,016.

Grant 564: F. E. Kelsey, assistant professor of pharmacology, University of Chicago, the effect of drugs on phosphorus metabolism, $500.

Grant 565: Gregory Pincus, director of laboratories, Worcester Foundation for Experimental Biology, the mechanism of action of the gonadotropic hormone, $2,100.

Grant 566: Mayo H. Soley, associate professor of medicine, University of California Medical School, the use of radioactive iodine in the treatment of hyperthyroidism, $500.

Grant 567: Edmond J. Farris, executive director, Wister Institute of Anatomy and Biology, and Boland Hughes, associate in urology, University of Pennsylvania School of Medicine, human spermatozoa, $4,800.

Grant 568: Robert L. Jackson, assistant professor of pediatrics, State University of Iowa, a statistical evaluation and reporting of clinical research of therapeutic value in the treatment of juvenile diabetes and of rheumatic fever, $3,000.

Grant 569: Samuel L. Saltzman, associate in ophthalmology, and Charles Haig, assistant professor of physiology and biochemistry, New York Medical College, the therapy of retinitis pigmentosa, $500.

Grant 570: F. William Sunderman, Pepper Laboratory of Clinical Medicine, University of Pennsylvania, the use of congo red in measuring serum volume and in detecting amyloidosis, $400.

Grant 571: Edmond J. Farris, executive director, Wistar Institute of Anatomy and Biology, and Boland Hughes, associate in urology, University of Pennsylvania School of Medicine, the effects of endocrines and other substances on spermatogenesis in males with low sperm counts, $1,200.

Grant 572: C. H. Werkman, head of the department of bacteriology, Iowa State College, the mechanism of action of penicillin and streptomycin, $1,000.

Grant 573: Joseph L. Lilienthal Jr., Johns Hopkins Hospital, relation of the enzyme system to pathophysiology of muscle and nerve function, $500.

Grant 574: E. A. Evans Jr., chairman, department of biochemistry, University of Chicago, biochemical study of the cellular mechanism for protein synthesis, $500.

Grant 575: Tom Addis, E. Barrett, L. J. Poo, L. Way and W. Yuen, department of medicine, Stanford University School of Medicine, reasons for the differences in the effects of various proteins on the rate of growth of the kidney, $1,000.

Grant 576: Harold D. Green, professor of physiology and pharmacology, Wake Forest College, Bowman Gray School of Medicine, the effects of heparin on traumatic shock, $300.

Grant 577: Windsor C. Cutting, associate professor of therapeutics, Stanford University School of Medicine, the chemotherapy of virus infections, $300.

Grant 578: Aaron E. Margulis, director, department of bacteriology, New York Post-Graduate Medical School and Hospital, experimental and clinical endocarditis, $1,000.

Grant 579: Aaron E. Margulis, director, department of bacteriology, New York Post-Graduate Medical School and Hospital, bacteriophage phenomenon, $1,000.

Grant 580: Joseph Ney, clinical instructor in medicine, and Paul K. Smith, associate professor of pharmacology, the effects of BAL on the toxicity and excretion of gold salts, $350.

Grant 581: Victor Ross, department of biochemistry, Columbia University College of Physicians and Surgeons, Schick toxin and protamine-tetanus toxoid, $350.

Grant 582: Allan D. Bass, Syracuse University College of Medicine, vascular disease and hypertension, $500.

The following is a list of the investigations conducted with the assistance of grants made by the Committee on Therapeutic Research, reports of which were published during 1946:

Clinical Arrest in Enterococcal Endocarditis, Ward J. Mac Neal, Anne Blevins and Charles A. Poindexter: *Am. J. M. Sc.* **211**: 40 (Jan.) 1946.

Experimental Nonbacterial Cardiovascular Inflammation, Ward J. Mac Neal, Anne Blevins, Alice E. Slavkin and Helen Scanlon: *Fed. Proc.*, March 1946.

Direct Culture of Rheumatic Virus, Ward J. Mac Neal, Katherine Wardell, Anne Blevins and Marcello R. Pacis: *Science* **103**: 620 (May 17) 1946.

Actinomyces Septicus from Human Endocarditis, Anne Blevins and Ward J. Mac Neal: *Am. Heart J.* **31**: 663 (June) 1946.

Clinical Arrest of Endocardial Actinomycosis After Forty-Four Million Units of Penicillin, Ward J. Mac Neal, Anne Blevins and A. Wilbur Duryee: *Am. Heart J.* **31**: 668 (June) 1946.

Conjoined Action of Penicillin and Bacteriophages, Ward J. Mac Neal, Louise Filak and Anne Blevins: *J. Lab. & Clin. Med.* **31**: 974 (Sept.) 1946.

Growth of Children with Diabetes Mellitus in Relationship to Level of Control of the Disease, Robert L. Jackson and Helen G. Kelly: *J. Pediat.* **29**: 316 (Sept.) 1946.

Heart Disease in Children in a Rural Iowa County—Particularly in Relation to Rheumatic Fever, Robert L. Jackson: *J. Pediat.* **29**: 647 (Nov.) 1946.

Use of Oral Penicillin in Treatment of Bacterial Asthma, Frieda Baumann, Jean Crump, Ann Catherine Arthurs, Lloyd D. Seager and Ruth E. Miller: *J. Allergy* **17**: 265 (Sept.) 1946.

The Influence of a Strepogenin Concentrate on the Metabolism of Glutamic Acid by Streptococcus Fecalis, John R. Totter and Mary E. Mallory King: *J. Biol. Chem.* **165**: 391 (Sept.) 1946.

Sulfonamides and Dark Adaptation, Donald Slaughter: *J. Lab. & Clin. Med.* **31**: 987 (Sept.) 1946.

The Metabolism of Methylxanthines and Their Related Methyluric Acids, Victor C. Myers and Ramon F. Hanzal: *J. Biol. Chem.* **162**: 309 (Feb.) 1946.

The Effect of Cellular Hydration on Experimental Electroshock Convulsions, Ewart A. Swinyard, James E. P. Toman and Louis S. Goodman: *J. Neurophysiol.* **9**: 47, 1946.

Studies on the Metabolism of Brain Suspensions: III. Respiration at Low Oxygen Tension, K. A. C. Elliott and Maryon Henry: *J. Biol. Chem.* **163**: 351 (May) 1946.

Studies on the Metabolism of Brain Suspensions: IV. Anaerobic Glycolysis, K. A. C. Elliott and Maryon Henry: *J. Biol. Chem.* **163**: 361 (May) 1946.

Properties of Maximal Seizures and Their Alteration by Anticonvulsant Drugs and Other Agents, James E. P. Toman, Ewart A. Swinyard and Louis S. Goodman: *J. Neurophysiol.* **9**: 231, 1946.

Inhibitory Potency of Sympathomimetic Amines and Their Ganglionic Inhibitory Action, Amedo S. Marrazzi and Rose N. Marrazzi: *Fed. Proc.*, March 1946.

Reduction of Sympathetic Transmission as an Index of Inhibition at Adrenergic Junctions in General, Amedeo S. Marrazzi: *Science* **104**: 2688 (July 5) 1946.

The Estimation of the Cutaneous Blood Flow with the Photoelectric Plethysmograph, A. B. Hertzman, W. C. Randall and K. E. Jochim: *Am. J. Physiol.* **145**: 716 (March) 1946.

The Quantitation of Cutaneous Vascular Reactions with the Photoelectric Plethysmograph, A. B. Hertzman, W. C. Randall and K. E. Jochim: *Fed. Proc.* **5**: 45 (March) 1946.

Enzyme Problems in Relation to Chemotherapy, "Adaptation," Mutations, Resistance and Immunity, M. G. Sevag: *Advances in Enzymology* **6**: 33, 1946.

On the Specificity of Histamine and on the Role of Potassium in a Loss of Contractility of the Intestinal Smooth Muscle of the Guinea Pig, G. L. Cantoni and G. Eastman: *Fed. Proc.*, March 1946.

On the Response of the Intestine to Smooth Muscle Stimulants, G. L. Cantoni and G. Eastman: *J. Pharmacol. & Exper. Therap.* **87**: 392 (Aug.) 1946.

Dietary Protein and Protoporphyrin Formation in the Rat, James M. Orten and Judith Mackey Keller: *J. Biol. Chem.* **165**: 163 (Sept.) 1946.

Further Observations Concerning Effect of Adrenalectomy on Alloxan Diabetes: Paired Feeding Experiments, R. G. Janes, H. Dawson and L. Myers: *Am. J. Physiol.* **145**: 538 (Feb.) 1946.

The Influence of Diethylstilbestrol on Alloxan Diabetes Paired Feeding Experiments, R. G. Janes and H. Dawson: *Endocrinology* **38**: 10 (Jan.) 1946.

The Effect of Diethylstilbestrol on Thyroidectomized Rats, Ralph G. Janes: *Am. J. Physiol.* **145**: 411 (Jan.) 1946.

Chemotaxis in Leukocytes, Morton McCutcheon: *Physiol. Rev.* **26**: 319 (July) 1946.

The Change in the Water Metabolism and in the Endocrine Glands of Long-Surviving Diabetes Insipidus Dogs, Richard C. de Bodo and David Marine: *Fed. Proc.* **5**: 22, 1946.

The Water Exchange of Diabetes Insipidus Dogs Under Varying Nutritional and Hydration Conditions, Richard C. de Bodo and Kathryn F. Prescott: *Fed. Proc.* **5**: 23, 1946.

The Acute and Chronic Toxicity of Stilbamidine, Lloyd D. Seager and Gina Castlenuovo: *Fed. Proc.* March 1946.

The Influence of Diet on Uropepsin, Gladys R. Bucher: *Fed. Proc.*, March 1946.

The following grants were issued before Jan. 1, 1946. In some cases the grant has expired and an unexpended balance remains, or the work is not yet completed or not yet published:

Grant 408: Ephraim Shorr, associate professor of medicine, Cornell University Medical College, the effect of progesterone on the vaginal smear, $300.

Grant 443: A. B. Baker, associate professor of neuropsychiatry and neuropathology, and Raymond N. Bieter, professor of pharmacology, University of Minnesota Medical School, toxic effects of sulfanilamide and derivatives on nervous system and effect of vitamin B complex in prevention of such injuries, $500.

Grant 454: W. L. Mendenhall, professor of pharmacology, and Albert J. Plummer, assistant professor of pharmacology, Boston University School of Medicine, the quantitative determination of theophylline, $50.

Grant 455: Frederick H. Pratt, professor of physiology, and Marion A. Reid, instructor in physiology, Boston University School of Medicine, the effect of cardiac drugs on the denervated lymphatic hearts, $100.

Grant 459: Mary E. O'Sullivan, Bellevue Hospital, New York City, the therapeutic effect of estradiol in muscular dystrophy, $100.

Grant 472: Robert V. Brown, professor of physiology and pharmacology, University of North Dakota, action of pilocarpine on bile secretion, $150.

Grant 474: Arthur C. DeGraff, professor of therapeutics, New York University College of Medicine, the effectiveness of sodium thiosulfate and sodium formaldehyde sulfoxalate in treatment of cardiac arrhythmias induced experimentally by mercurial diuretics, $400.

Grant 479: Mayo H. Soley, associate professor of medicine, University of California Medical School, treatment of patients with toxic diffuse goiter by means of radioactive iodine, $350.

Grant 484: Alfred Goerner, associate professor of biologic chemistry, Long Island College of Medicine, and M. Margaret Goerner, pathologist, Brooklyn Thoracic Hospital, the toxic action of carcinogenic compounds on liver tissue, $400.

Grant 488: L. R. Kaufman, director of surgery, New York Medical College, circulatory competence of the gut in cases of intestinal obstruction, $125.

Grant 489: L. R. Kaufman, director of surgery, New York Medical College, the use of enzyme mixture for dissolving slough, $100.

Grant 498: Linn J. Boyd, director of medicine, and Kurt Lange, clinical instructor in medicine, New York Medical College, the effect of cold in the treatment of shock, $300.

Grant 499: Joseph Litwins, clinical instructor in medicine, New York Medical College, the chemistry and hematology of blood donors, $200.

Grant 502: Julian P. Maes, department of pharmacology, Dartmouth College, the part played by the red blood corpuscle concentration of the systemic circulation in the maintenance of blood pressure at different levels of vasoconstrictor tone, $150.

Grant 506: Andrew F. Burton, assistant professor of pharmacology, Howard University, (1) the distribution of sulfanilamide in maternal and fetal tissues at various stages of pregnancy, (2) the toxic effects of quinine on the fetus in utero, $600.

Grant 513: Ruth E. Miller, professor of bacteriology, Woman's Medical College of Pennsylvania, the relationship between immune mechanisms and bacterial respiration, $412.50.

Grant 514: Morton McCutcheon, professor of pathology, University of Pennsylvania School of Medicine, the toxicity of sulfonamides and penicillin and the mechanism of chemotaxis in leukocytes, $150.

Grant 515: Harald G. O. Holck, associate professor of pharmacology, University of Nebraska School of Medicine, the relationship of sex to drug action, $200.

Grant 516: Nellie Perry Watts, department of pharmacology, Woman's Medical College of Pennsylvania, methods to prolong the action of local anesthetic drugs, $250.

Grant 517: Harry Beckman, professor of pharmacology, Marquette University School of Medicine, avian malaria, $250.

Grant 524: Harry E. Morton, associate professor of bacteriology, University of Pennsylvania School of Medicine, necessity of bacteriostasis or bactericidal action to prevent infection in an animal body, $100.

Grant 525: Herbert Silvette, assistant professor of pharmacology, University of Virginia Medical School, the effect of low barometric pressures on kidneys previously damaged, either surgically or by drugs, $250.

Grant 528: Linn J. Boyd, director of medicine, and Kurt Lange, clinical instructor in medicine, New York Medical College, capillary permeability of the meninges in meningitis and meningisms, $350.

Grant 529: Linn J. Boyd, director of medicine, and Kurt Lange, clinical instructor in medicine, New York Medical College, the effectiveness of physical therapeutic measures in peripheral vascular diseases, $350.

Grant 531: Thomas H. McGavack, associate professor of medicine, New York Medical College, the absorption of compressed pellets of the steroid hormones, $400.

Grant 532: Thomas H. McGavack, associate professor of medicine, New York Medical College, and Herbert Elias, New York Medical College, inulin and diodrast clearances in endocrine diseases, $250.

Grant 533: Robert S. Teague, associate professor of physiology and pharmacology, University of Alabama School of Medicine, the metabolism of diethylstilbestrol and its derivatives, with emphasis on the ration of absorption, the distribution, fate and excretion of these drugs, $500.

Grant 534: Stephen P. Jewett, New York Medical College, the use of ammonium chloride in psychiatric disorders, $350.

Grant 538: Thomas H. McGavack, associate professor of medicine, New York Medical College, water balance under the influence of various hormones, $200.

Grant 542: Woman's Medical College of Pennsylvania, the use of penicillin therapy in intrinsic (bacterial) allergy with chronic infection of the sinuses, $500.

Grant 543: Harold D. Green, professor of physiology and pharmacology, Wake Forest College, Bowman Gray School of Medicine, the influence of environmental temperature on ischemic compression shock, $400.

Grant 545: Robert Chambers, research professor of biology, New York University College of Medicine, blood capillary fragility, $500.

Grant 546: Stuart Mudd, professor of bacteriology, University of Pennsylvania School of Medicine, the mode of action of the sulfonamides, $1,000.

Grant 547: L. M. N. Bach, department of physiology, Tulane University of Louisiana School of Medicine, the effect of certain hormones on the kidney tubules, $150.

Grant 548: Fred W. Ellis, assistant professor of pharmacology, University of North Carolina Medical School, the effect of some new synthetic spasmolytic agents, $250.

Grant 549: W. F. Hamilton, professor of pharmacology and physiology, University of Georgia School of Medicine, significant blood pressure changes in unanesthetized animals, $125.

Grant 550: C. A. Handley and S. A. Peoples, department of pharmacology and physiology, Baylor University College of Medicine, water distribution of the body following the administration of digitalis, $150.

Grant 552: Leland C. Wyman, associate professor of physiology, Boston University School of Medicine, the factors controlling the growth and functional efficiency of transplanted adrenal cortical tissue, $285.

Grant 553: Adrian C. Kuyper, assistant professor of physiologic Chemistry, Wayne University College of Medicine, a procedure for the detection and determination of unidentified plasma constituents, $375.

Grant 555: Gladys Bucher, associate in physiology, Woman's Medical College of Pennsylvania, pepsin in the urine, $500.

Grant 557: Lloyd D. Seager, professor of pharmacology, Woman's Medical College of Pennsylvania, the acute and chronic effects of the diamidines, $500.

TREASURER'S REPORT

Report of the Treasurer of the American Medical Association for the Year Ended December 31, 1946

Investments (at cost) as at January 1, 1946		$5,589,268.47	
Bonds Purchased (at cost)		3,960,952.66	
		$9,550,221.13	
Less:			
Bonds called, matured or sold	$3,425,876.22		
Bonds transferred to American Medical Association Research Fund (at cost)	1,499,512.50	4,925,388.72	
Investments as at December 31, 1946			$4,624,832.41
Balance for Investment January 1, 1946		126,824.36	
Interest Received on Investments in 1946		136,685.22	
		$263,509.58	
Transferred to General Fund		144,256.95	
Uninvested Funds at December 31, 1946			119,252.63
Invested and Uninvested Funds as at December 31, 1946			$4,744,085.04

◆

AMERICAN MEDICAL ASSOCIATION RESEARCH FUND

Investments (at cost) as at December 31, 1946	$1,499,512.50
Uninvested Funds as at December 31, 1946	487.50
Invested and Uninvested Funds as at December 31, 1946	$1,500,000.00

◆

DAVIS MEMORIAL FUND

Balance in Fund January 1, 1946	$7,904.01	
Interest earned on Bank Balance in 1946	99.10	
Funds on deposit as at December 31, 1946		$8,003.11

Josiah J. Moore, Treasurer.

AUDITOR'S REPORT

January 29, 1947.

To the Board of Trustees,
American Medical Association,
Chicago, Illinois.

Dear Sirs:

We have examined the balance sheet of the American Medical Association, Chicago, Illinois, as of December 31, 1946, and the statement of income for the year ended on that date, have reviewed the system of internal control and the accounting procedures of the Association and, without making a detailed audit of the transactions, have examined or tested accounting records and other supporting evidence, by methods and to the extent we deemed appropriate except as hereinafter stated regarding confirmation of receivables and observation of the inventory taking.

The cash and bank balances have been confirmed by count or by certificates from the depositaries. The United States Government and other marketable securities were confirmed by an acknowledgement from the Continental Illinois National Bank and Trust Company of Chicago where the securities are held for safekeeping.

We did not independently confirm the accounts receivable by communication with the debtors. The accounts receivable were reviewed as to age and collectibility and, in our opinion, the balances are fully realizable. We reviewed the plan and system of control adopted for inventory taking but we did not observe the taking of the inventories nor did we make tests of the physical existence of the quantities recorded.

Expenditures charged to property and equipment accounts during the year, in our opinion, were properly capitalized as representing additions or improvements. The provision for depreciation for the year appears to be adequate.

All ascertained liabilities have been included in the accounts. Attorneys for the Association state that no litigation was pending against the Association as of the balance sheet date.

During the year under review the Association revised its accounting procedure relative to interest on investments, taxes, and unpaid expenses, which previously were not recorded until received or paid, and such items now are recorded on the accrual basis and have been dealt with accordingly in the assets and liabilities at December 31, 1946. No adjustment has been made in the income account, however, with respect to the corresponding items which were not recorded in the balance sheet at the close of the preceding year.

In our opinion, subject to the exceptions set forth in paragraph three and the foregoing observation regarding the change in accounting procedure, the accompanying balance sheet and related statement of income present fairly the position of the Association at December 31, 1946, and the results of the operations for the year.

Fidelity insurance is carried on all officers and employees under a blanket position policy in which each individual is covered in the amount of $50,000.00; said amount of coverage in the case of collusion applies to each individual involved.

We have pleasure in reporting that the books are well maintained and that every facility was afforded us for the proper conduct of the examination.

Yours truly,
Peat, Marwick, Mitchell & Co.

STATEMENT OF INCOME

FOR THE YEAR ENDED DECEMBER 31, 1946

Income:			
Fellowship dues			$ 66,946.00
Income from investments			150,133.89
Miscellaneous receipts and other income			85,097.59
			302,177.48
Publications—Periodicals:			
Subscriptions		$1,506,046.90	
Advertising		2,079,081.60	
		3,585,128.50	
Costs and expenses—Schedule "1"		2,414,163.44	1,170,965.06
Books, pamphlets and reprints sold		98,897.71	
Less—Printing and other costs		65,371.55	33,526.16
Total Income			1,506,668.70
Expenses:			
Conducting councils, bureaus and committees—Schedule "2"		890,178.99	
Legal and investigating		27,895.79	
Employees' group annuities		138,265.55	
State Unemployment Tax:			
Years 1936 to 1945 inclusive	$271,095.39		
Current year 1946	52,501.74	323,597.13	
Federal social security tax		18,998.40	
Miscellaneous		1,364.51	1,400,300.37
Income in Excess of Expenses			$ 106,368.33

Schedule "1"

PUBLICATIONS (PERIODICALS) COSTS AND EXPENSES

FOR THE YEAR ENDED DECEMBER 31, 1946

Wages and salaries		$1,138,859.02
Paper stock		422,060,73
Engravings and illustrations		57,004.88
Ink		25,373.73
Magazine mailing supplies		2,314.45
Factory supplies		21,284.88
Repairs and renewals—Machinery		3,743.37
Express and cartage		13,374.69
Power and light		15,488.27
Building maintenance expense		70,424.54
Fuel		6,700.26
Insurance and taxes		74,032.57
Editorial news and reporting		30,722.76
Postage—First class		70,806.03
Postage—Second class		83,669.73
Subscriptions and advertising commissions		164,876.67
Discounts		77,639.04
Exchange		2,193.82
Subscription promotion expense		25,628.37
Office supplies		18,911.26
Telephone and telegrams		6,253.28
Office printing		33,843.23
Binding		6,058.58
Miscellaneous operating expense		33,493.23
Employees' group hospital and life insurance		11,869.11
Decrease in estimated cost to complete issues of special journal publications		(3,348.27)
Bad debts and tax recoveries and refunds—Net		(3,042.23)
Profit on sale of equipment		(2,010.18)
Loss on metal dross sales		1,362.38
		2,409,588.20
Depreciation (based on estimated remaining life):		
Buildings	$23,133.80	
Machinery	14,841.75	
Type and factory equipment	1,746.33	
Laboratory equipment	692.95	
Furniture and equipment	7,668.21	48,083.04
		2,457,671.24
Deduct—Proportion of overhead expenses charged to other publications and departments		43,507.80
Total Publications (Periodicals)—Costs and Expenses		$2,414,163.44

NOTE.—Total wages and salaries for year 1946 amounted to $1,916,310.69. Of this amount $1,138,895.02 is included above, $552,097.84 is shown in Schedule "2" (Expenses of Councils, Bureaus and Committees), and the remainder $225,317.83 was disbursed on the maintenance of records which will be used in connection with the next edition of the American Medical Directory, and with printing of books, reprints and pamphlets, and printing in process at the close of the year.

Schedule "2"

EXPENSES OF COUNCILS, BUREAUS AND COMMITTEES

FOR THE YEAR ENDED DECEMBER 31, 1946

Salaries and wages	$552,097.84
Office printing and binding	22,800.23
Office supplies and repairs	9,185.67
Express, telephone and telegraph	9,372.66
Postage	11,438.15
Books and periodical subscriptions	1,775.34
Legislative services	2,644.27
Miscellaneous expenses	19,542.44
Educational material distributed	5,246.44
Staff travel	50,050.58
Radio broadcasting and electrical transcriptions	30,074.78
Inspection of hospitals and medical schools	7,712.51
Educational exhibits	10,097.29
Trustees' meeting expenses	16,491.14
Grants, tests and investigations	44,010.96
Section secretaries' conference and honorariums	4,004.16
State secretaries' conference	15,649.75
Council and bureau conferences	18,837.03
Sundry committee expenses	59,147.75
Total Expenses of Councils, Bureaus and Committees	$890,178.99

NOTE.—The above expenses are spread over the following Councils, Bureaus and Committees as indicated: Association, $268,898.97; Bureau of Health Education, $85,172.68; Council on Pharmacy and Chemistry, $85,245.93; Chemical Laboratory, $25,308.88; Council on Physical Medicine, $25,058.69; Council on Foods and Nutrition, $20,840.56; Committee on Therapeutic Research, $19,772,61; Council on Medical Education and Hospitals, $91,423.08; Bureau of Legal Medicine and Legislation, $44,310.53; Bureau of Investigation, $10,816.25; Bureau of Medical Economic Research, $19,948.12; Council on Industrial Health, $38,937.82; Association and Bureau of Exhibits, $40,484.97; Council on Medical Service, $106,686.12; Committee on Medical Preparedness, $7,273.78.

REPORT OF THE JUDICIAL COUNCIL

To the Members of the House of Delegates of the American Medical Association:

This report covers the work of the Judicial Council since its midwinter meeting, which was held in conjunction with the supplemental session of the House of Delegates. At that and at a subsequent meeting held on March 14, 1947 the usual routine business was transacted. This consisted in the consideration of those applying for Fellowship whose eligibility was questioned, the recommendation of candidates for Associate Fellowship and the consideration of many requests for decisions concerning the ethics of practices which are either being followed already or are contemplated. A great majority of these queries were answered by the Chairman, who expressed his personal opinion, with the assurance that the decision of the entire Council would be forthcoming at the next meeting. Two appeals on the charge of plagiarism were considered, and the Council continued examination of a pending appeal regarding a voluntary insurance plan.

By far the largest number of requests for information or for approval were received from ophthalmologists who have submitted practically every conceivable plan to circumvent the section of the Principles of Medical Ethics concerning rebates, which reads in part as follows:

> It is unprofessional to receive remuneration from patents or copyrights on surgical instruments, appliances, medicines, foods, methods or procedures. It is unprofessional to accept rebates on prescriptions or surgical appliances, or perquisites from attendants who aid in the care of patients

It is strange that year after year more communications regarding these practices come from members of this particular field than from any other section of the practice of medicine. From information received, the Council has the impression that these or similar plans are at present openly used in various parts of the country. Nevertheless the Council is constrained to advise all members of the Association that, no matter how prevalent these practices may have become, they are still unethical. It should be well known by this time that the traditional interpretation of the Principles of Medical Ethics by the various Judicial Councils in the history of the Association has been that the doctor may receive no profit whatever from his patient other than payment for rendered medical services. Hence it should be apparent that *no rebate of any kind, in any form or from any source can be accepted* This applies also to rebates coming from agents or owners of optical companies. They are, in every case, absolutely unethical. Another scheme presented to the Council would permit doctors owning the stock of a drug company to refer their patients to this company and divide the profits from the sale of the drugs. This is, of course, another violation of ethics, for it is specifically stated in the principle quoted that a profit from the sale of medicine to patients cannot be accepted by the doctor. This rule has been expressed so many times in decisions by the Council that it is surprising it is not better understood.

There was presented also at the December meeting the report of Dr. A. C. Ivy as a representative of the United States government in which he reviewed the war crimes of a medical nature committed by the Germans during the past war. The Council found that the practices outlined in Dr. Ivy's report were definitely opposed to the Principles of Medical Ethics of the American Medical Association and are certainly to be condemned. In order to conform to the ethics of this Association, these three requirements must be satisfied:

> 1. The voluntary consent of the person on whom the experiment is to be performed must be obtained
>
> 2. The danger of each experiment must be investigated previously by means of animal experimentation
>
> 3 The experiment must be performed under proper medical protection and management

Many other complaints of the violation of medical ethics by individual physicians in the relationship between medical men were received by the Council, even the question of threatened physical violence.

In some of these complaints, it would seem that corrective or punitive measures are expected from the Judicial Council. The Council is not a legislating body. That function rests in the House of Delegates. The Judicial Council is a court to interpret the laws and ethics of the medical profession and to adjudicate those matters brought to it from the state associations under the Constitution and By-Laws. The responsibility for correcting a condition must be left to the state associations. Only when the situation involved becomes of general rather than local concern may the Judicial Council interfere. In such cases it has the power to request the President to appoint an investigating jury to consider the complaint.

The operation of the voluntary insurance plan is entirely under the control of the Council on Medical Service and is certainly not in the province of the Judicial Council. However, the Judicial Council has jurisdiction on all questions of ethics and in the interpretation of the laws. The question of ethics of some of the voluntary insurance plans has been brought to the attention of the Council in such a manner that its members feel it incumbent on them to present some slight interpretation of the laws adopted by the House of Delegates in Cleveland in June 1934 and amended slightly at the annual session in 1935. These ten principles are basic laws for the establishment and operation of all voluntary insurance plans and are as follows:

> First: All features of medical service in any method of medical practice should be under the control of the medical profession No other body or individual is legally or educationally equipped to exercise such control.
>
> Second No third party must be permitted to come between the patient and his physician in any medical relation. All responsibility for the character of medical service must be borne by the profession.
>
> Third: Patients must have absolute freedom to choose a legally qualified doctor of medicine who will serve them from among all those qualified to practice and who are willing to give service.
>
> Fourth The method of giving the service must retain a permanent, *confidential relation between the patient and a "family physician." This* relation must be the fundamental and dominating feature of any system
>
> Fifth All medical phases of all institutions involved in the medical service should be under professional control, it being understood that hospital service and medical service should be considered separately. These institutions are but expansions of the equipment of the physician. He is the only one whom the laws of all nations recognize as competent to use them in the delivery of service The medical profession alone can determine the adequacy and character of such institutions Their value depends *on their operation according to medical standards*
>
> Sixth In whatever way the cost of medical service may be distributed, it should be paid for by the patient in accordance with his income status and in a manner that is mutually satisfactory
>
> Seventh. Medical service must have no connection with any cash benefits.
>
> Eighth: Any form of medical service should include within its scope all legally qualified doctors of medicine of the locality covered by its operation who wish to give service under the conditions established
>
> Ninth: Systems for the relief of low income classes should be limited strictly to those below the "comfort level" standard of income
>
> Tenth: There should be *no restrictions on treatment or prescribing* not formulated and enforced by the organized medical profession

The Judicial Council calls attention to the third point which defines the free choice of physician. This the Council interprets to mean not only the patient's right to choose any physician desired but also, conversely, the physician's right to accept or reject any patient requesting his services under the plan. It also expressly requires that any qualified, licensed physician residing in the area in which the plan operates be allowed to participate. Thus we see that to be a participating doctor in a voluntary insurance plan it is not necessary for one to be a member of the American Medical Association. It is, however, necessary for him to accept and obey the terms of the contract offered by the plan and on violation of the terms he may be dropped from the rolls, if the violation seems sufficiently grave for such action. It is needless for us to remind members that any violation of this provision would indeed deprive the public of the choice of a great many physicians. As the voluntary plans are intended to cover and supply sufficient medical care of a high quality for the whole country, with no feature of a compulsory system, it is necessary that the principle be strictly observed However it is tacitly understood that any contract between an approved voluntary medical plan and a doctor includes an understanding that the ethics of the American Medical Association will not be violated. These basic points also require that the medical profession determine the adequacy and character of the hospitals. All hospitals approved by the local physicians and willing to accept the terms of the plan should be allowed to participate. In order that a high standard of medical service be maintained, hospitals may limit somewhat the number of physicians who deliver medical service in their institutions and even assign a physician to certain definite fields in accordance with his training and experience. The widest possible use of hospitals approved by the local profession should be encouraged in order not to limit the number of doctors made available for the plan. Under no circumstances shall doctors working under this plan be forced to send patients to a particular hospital unless it is the only one approved in that area.

In its report to the House of Delegates at the Supplemental Session in December the Council called attention to the section of the Principles of Medical Ethics which controls group practice. It was stated in that report that the ethical principles controlling group practice were the same as for the individual. Since the principle of ethics for private practice absolutely forbids the splitting of fees under any and all circumstances, the same rule applies to group practice and, as pointed out in that report, the group formed must be a real partnership in which the total income is divided not equally but according to the individual income earned by the member.

Since that report was submitted, the legislature of one of the largest states has enacted a law which allows groups to form and which legalizes the pooling of income and the division of monies received for service. The law contains no directive as to the manner in which the division is to be made. These groups may be organized for the purpose of delivering medical services under insurance plans of nonprofit organizations only. Singularly in the same bill, the formation of these groups and such pooling and division of monies is expressly forbidden in the work done under the workmen's compensation law or any other than for nonprofit organizations. Such procedures in practice under the workmen's compensation law remains a misdemeanor. Under this state's educational law, the splitting of fees or requesting of rebates in general medical practice is punishable by suspension or revocation of medical license. It is difficult to understand why a law should be enacted allowing the division of monies received from one source and denying it to all others. Obviously those interested in the operation of the workmen's compensation law were fearful lest such procedure would lead to unethical fee splitting. They wanted to protect their injured workmen against the danger of unnecessary operations and the referring of patients to those not properly qualified or experienced to render service of a sufficiently high medical standard (by ethical doctors). Their position is to be commended but the Council sees no reason why the same protection should not be afforded to those insured in nonprofit organizations.

The Judicial Council realizes that bills passed by a legislature and enacted into law must be obeyed. They remain laws of the commonwealth until they are repealed, superseded or declared unconstitutional and as such should be respected. While one is allowed the privilege of organizing or becoming a member of a group, one is not compelled to do so. It is entirely a voluntary act as the law is permissive rather than mandatory. It was enacted apparently for the benefit of an insurance plan about to be launched for the employees of a large municipality of that state. This is plainly a matter to be handled by the state medical association. The duty of the Council is to draw attention to this condition and to admonish those accepting contracts under the plan that the splitting of fees is still a violation of the Principles of Medical Ethics of the American Medical Association. Those who indulge in this form of group practice are warned also of the fact that the sending of joint or combined bills for services is considered unprofessional not only by the American Medical Association but also by all national specialty societies. Attention is called to this unusual local situation because of the danger of unwittingly accepting an unethical practice. It must be insisted that, in spite of conditions herein outlined, the members of the American Medical Association continue to maintain high ethical and professional standards. They should realize the evils which may arise from entering into an unethical contract.

The Council's report on the revision of the Principles of Medical Ethics will be presented to the House of Delegates in a supplementary report.

Respectfully submitted,

EDWARD R. CUNNIFFE, Chairman.
LLOYD NOLAND.
JOHN H. O'SHEA.
LOUIS A. BUIE.
WALTER F. DONALDSON.

REPORT OF THE COUNCIL ON MEDICAL EDUCATION AND HOSPITALS

To the Members of the House of Delegates of the American Medical Association:

The major concerns of the Council on Medical Education and Hospitals during the past year have been with problems relating to the reconversion of medical education to a peacetime status and with the continuing efforts to provide residency training of good quality to the large number of returning medical officers desiring such work.

SURVEY OF MEDICAL SCHOOLS

The Council recommended to the Board of Trustees of the American Medical Association that a complete survey of the medical schools of the United States be undertaken as soon as feasible. The Board of Trustees has adopted this recommendation and has decided to provide the required financial support. The last complete survey of medical schools was made during the years 1934-1936. Since that time many medical schools have been visited by the members and staff of the Council to assist schools in meeting special problems and to evaluate the work of new institutions or of schools in which special difficulties had arisen.

A new complete survey is considered desirable because of the lapse of time since the last survey and because of the intervening events, especially the war and its aftermath, which have seriously affected medical education. In the conduct of this survey it is the opinion of the Council that the best results can be achieved by a close collaboration with the Association of American Medical Colleges and possibly other organizations. The work of the Council over the more than forty years of its existence has always been characterized by cooperation with appropriate organizations and institutions. In the case of medical school problems, the cooperating agency has been the Association of American Medical Colleges. Similarly, problems related to standards and approval of hospital residencies have been dealt with collaboratively with the Advisory Board for Medical Specialties and the various American specialty boards. Again, in the technical fields ancillary to medicine there has been joint action by the Council and the national organizations in the fields concerned. Regarding such cooperation, Dr. Arthur Dean Bevan, first Chairman of the Council, stated concerning the revolutionary changes effected by the Council in medical education in the first two decades of the century: "The fight for higher standards of medical education has been won. It has been won by the united efforts of the American Medical Association, the Federation of State Medical Licensing Boards, the Association of American Medical Colleges, the American universities and colleges and the great educational foundations. . . . This great educational advance, the greatest that has occurred in any field of education in the last twenty-five years, is a wonderful example of what can be accomplished by the right sort of cooperation of the forces vitally involved in a great problem." Such cooperation should be continued and strengthened whenever possible in the many activities of the Council.

There are several organizations undertaking the study of some one or another isolated field in the total program of medical education. Examples are in the fields of pediatrics and nutrition. A resolution concerning the survey of pediatric facilities and pediatric education being conducted by the American Academy of Pediatrics was referred to the Council on Medical Education and Hospitals by the House of Delegates. The Council is in accord with the objectives of such surveys but feels that the various departments of a medical school are so intimately interdependent that such surveys may be of limited value. The Council has stated to the Academy that it will be interested in the findings of this survey and is willing to be of assistance wherever possible. A representative of the Council has attended an organization meeting for this survey and is keeping in contact with the project.

Similarly, regarding the resolution of the House of Delegates concerning a restudy of the teaching of preventive medicine and public health to undergraduate medical students, it was deemed inadvisable to conduct an independent survey of the teaching of this subject but rather to include such a study as part of the survey of all aspects of medical education in our medical schools which is to be carried out.

SUPPLY OF MEDICAL STUDENTS

The complete statistics on medical school enrolments are annually compiled for the Educational Number of The Journal of the American Medical Association which will appear later in the year. At present figures for the freshman class of 1946-1947 are available from sixty-eight of the seventy-seven medical schools and schools of the basic medical sciences. In these schools there is a total freshman enrolment of 5,323. This figure may be compared with the enrolment in the 1945-1946 freshman class, which amounted to 5,214 in the same sixty-eight schools. These figures indicate that there is no reduction in numbers in the current freshman class. It has been possible to secure these students despite former Selective Service policies because the cessation of hostilities occurred earlier than was anticipated, making available a large number of veterans judged qualified for the study of medicine. Over 60 per cent of the present freshman class is made up of veterans. There is also a larger enrolment of women than has formerly been the case. Rarely, if ever, has there been as many as 6 per cent women among medical students. For the academic session preceding the present one the percentage of women in all classes rose to 8. In the 1946-1947 freshman class only there are 11 per cent women.

Rather generally in the colleges and universities of the country the academic performance of veterans including those in premedical studies has compared very favorably with that of nonveterans. In the veteran group there appears to be a decidedly greater work motivation. Whether this will continue to be true and whether veterans will perform equally well in their medical studies remains to be seen.

DECELERATION OF MEDICAL EDUCATION

All medical schools have abandoned compulsory acceleration, although a few schools permit acceleration on a voluntary basis for selected students. All schools have returned to the annual admission of students with the academic year commencing in the autumn and continuing until June.

FINANCING OF MEDICAL EDUCATION

Much attention has been given in the past year to the problem of adequate financing of medical education. While costs have been rising, income from certain sources has decreased. In many instances budgets were appreciably increased during the war partly on the basis of increased tuition income resulting from the accelerated program, admissions of students every nine months, increased wartime enrolments and the payment by the government of out-of-state tuition fees in state institutions. Decreased tuition income following the war now necessitates appreciable increases in other financial support of medical education to avoid a deterioration of its quality. In the survey of medical colleges to be undertaken, the financial structure and annual support of the institutions will be thoroughly analyzed.

RESIDENCIES FOR PHYSICIAN VETERANS

The efforts of the Council, hospitals and medical schools to provide facilities to meet the demands for residency training, particularly by returning medical officers, have resulted in providing residency positions for 10,422 physicians as of April 1, 1947. This compares with the prewar figure of 5,256 assistant residents, residents and fellows on duty in approved residency hospitals. This is a doubling of the residency facilities. Some time before the cessation of hostilities it was estimated by the Council that an increase of approximately 100 per cent in residency facilities would be required to meet the needs of physician veterans.

Since the vast majority of medical officers who served at the peak of the manpower strength in the Army and Navy have now been discharged, it is probable that the peak demand for residencies already has been or soon will be reached. However, the desire for training facilities at this level will continue to be above normal for some time because many of the medical officers now on duty, the majority of whom had their hospital training curtailed, will continue to seek residencies on discharge for some time to come.

In the course of the calendar year 1946 there were 511 residency services approved on a temporary basis. Of these services nearly 40 per cent have subsequently been given "permanent" approval on the basis of surveys of the hospitals providing the residencies. It is anticipated that the temporary approval of residencies might soon be discontinued. It is also hoped that the passage of the war emergency and the lessening of the postwar problem in this field will permit the Council to inaugurate a policy of resurveying approved residencies and fellowships perhaps every five years.

RESIDENCIES IN THE FEDERAL SERVICES

In order to improve the quality of medical care in Army, Navy and Public Health Service hospitals and to attract young physicians into the services, these branches have instituted residency training programs in selected hospitals. The Council is collaborating with the services in an effort to establish acceptable training programs. In general, this program is in the developmental stage although considerable progress has been made.

By March 1, 1947 approval had been granted to seventy-four residency programs in twenty-three navy hospitals, and there have been thirty residency programs approved in ten army hospitals, while eight Public Health Service hospitals are offering thirteen approved residency programs.

VETERANS' HOSPITALS

During 1946 the Veterans Administration requested medical schools to cooperate in the professional and educational operation of certain veterans' hospitals. Within five months of inauguration of the program fifty-seven of the approved medical schools were collaborating with veterans' hospitals. In this arrangement the medical schools are responsible for the appointment of the staff, including residents, for the care of patients and for the conduct of educational programs at the residency level. This program also is in the formative stages, although the progress made in a relatively short time has been remarkable. There is almost universal agreement that this project is resulting in a very superior type of medical care for veterans and is attracting better men into the Veterans Administration hospitals. Dr. Paul B. Magnuson of the Veterans Administration has stated, concerning this project, "The work being done by these medical schools under the direction of the deans' committees has been the greatest accomplishment to date in the relationships between government and medicine." The Council is giving assistance to the Veterans Administration in carrying out the program. Residencies in the veterans' hospitals are considered for approval by the Council in the same manner as is true of residencies in general.

One of the main features of the forty-third Annual Congress on Medical Education and Licensure was a round table discussion of this Veterans Administration program. Participating were representatives of the Veterans Administration and of certain medical schools whose progress in the program has been furthest developed.

By March 1, 1947 the Council had approved twenty-six residency services in sixteen veterans' hospitals.

INTERNSHIPS

The intern field is different from the residency level of training in that the supply of internship places is fully adequate to meet the demands for internships. The annual Educational Number of The Journal of the American Medical Association published Aug. 17, 1946 reported a total of 8,584 approved internships in 798 hospitals. Progress is being made in the attempt to introduce uniformity into procedures for appointing interns. The major feature of this effort is the establishment of uniform dates for the filing of applications for internships and the release of credentials by medical schools. This was set at Oct. 15, 1947 for internships beginning July 1, 1948. Hospitals should not announce appointments before Nov. 15, 1947 although hospitals may send notification of rejections of applicants before that date. By this procedure it is anticipated that a prospective intern will have all acceptances in his hands at one time so that he may better choose the internship most attractive to him. The plan should eliminate unfair competition among hospitals in the securing of interns.

In accordance with a resolution of the House of Delegates in December 1946, which was referred to the Council on Medical Education and Hospitals for study, the Council has agreed that the technical staff and the Council in their evaluation of internships and residencies should take into account in their impressions of a hospital any attempts on the part of a hospital to seek to offset deficiencies in the education program by offering a relatively large remuneration to the house officers.

HOSPITAL SERVICE IN THE UNITED STATES

The annual hospital report of the Council on Medical Education and Hospitals published in The Journal of April 12, 1947 shows a significant decrease in the volume of hospital service in the last year. Compared with 1945, the number of hospital beds decreased from 1,738,944 to 1,468,714, the number of admissions from 16,257,402 to 15,153,452 and the average daily census from 1,405,247 to 1,239,454. This change in the daily patient load represents a decrease in the number of treatment days from 512,915,155 in 1945 to 452,400,710 in 1946. The reduction indicated by these figures has occurred in the federal group and is the result of the decrease in military hospitals in the last year. Civilian hospital service actually increased in 1946. There was an increase of nearly one million admissions in the nonfederal hospital group, and the number of births in hospitals totaled 2,136,373 as compared with 1,969,667 in 1945. This, it should be noted, is the first year in which hospital births in the United States has reached the two million mark. The nongovernmental hospitals reported 1,801,427 births in 1946, whereas the governmental group had 334,946. In the federal hospitals there was a reduction of 19,200 in comparison with the previous year. Nearly 97 per cent of the hospital births in 1946 occurred in the general hospital group, where an increase from 1,907,772 to 2,070,318 was reported. The maternity hospitals had 2.8 per cent and the remaining group less than 0.3 per cent of the hospital births.

The number of beds in the governmental classification showed a net loss of 273,984, although many of the beds released from military use have been absorbed by the Veterans Administration, whose facilities for medical, psychiatric and tuberculosis care have been increased to approximately 100,000 beds. In the nongovernmental group the increase totaled 3,754. The number of admissions decreased by 1,103,950 in 1946. This reduction was limited to the federal classification, which had a net loss of 2,098,238, while the remaining hospitals showed a substantial increase of 994,288. It can also be shown that the reduction in hospital admissions occurred almost exclusively in the general hospital field. This group reported a decrease of 1,176,762, while the psychiatric, tuberculosis and other hospitals had a net gain of 72,812. The general hospitals offer a tremendous volume of hospital service as evidenced by the report of 14,051,508 admissions in 1946, or 92.7 per cent of all patients admitted. The governmental general hospitals had 4,005,640 admissions, or 26.4 per cent, the nongovernmental general hospitals 10,045,868, or 66.3 per cent. An increase in tuberculosis hospitalization was noted in the present report, which shows a total of 99,741 admissions in the tuberculosis sanatoriums as compared with 86,186 in 1945. There was likewise an increase in the number of admissions to psychiatric hospitals, although these institutions received only 1.7 per cent of all patients admitted last year. This group, however, maintained an average daily census of 635,769, which represents over 51 per cent of the daily patient load in all registered hospitals.

Increased bed occupancy rates occurred in practically all hospital divisions in 1946. The governmental hospitals, as a group, showed an increase from 82.1 to 86.6 per cent, the nongovernmental hospitals from 76.0 to 78.1 per cent. In the general hospital division the percentage occupancy was 77.4, as compared with 72.0 in 1945. For all hospitals as a group the occupancy rate was 84.4 per cent, an increase of 3.6 per cent in the last year. In relation to the general hospital group there was a reduction of 3 days in the average length of stay per patient. The average stay in 1946 was 12.9 days, as compared with 15.9 in 1945. In the governmental general hospitals there was a reduction from 26.2 to 22.1 days, while in the nongovernmental group the decrease was from 9.5 to 9.2. The greatest variation in the length of hospitalization occurred in the governmental classification, where the average stay ranged from 12.1 days in the city-county hospitals to 30.3 in the federal group. The federal general hospitals, it should be noted, had a previous increase from 22.0 days in 1944 to 31.1 in 1945.

POSTGRADUATE COURSES

Semiannually the Council publishes in The Journal lists of continuation courses for physicians offered by educational institutions throughout the country during the ensuing six months. During the period from Jan. 1, 1947 to July 15, 1947 there were approximately 800 courses offered by about 90 institutions and organizations. This is by far the largest number of courses ever offered in a six month period. Medical schools have taken a prominent part in the presentation of this work. More than 40 schools participated in the presentation of over 500 of the courses. Apparently this work by medical schools, medical societies and other organizations and institutions is meeting a real need on the part of physicians desiring review work and an extension of their knowledge of recent developments in medicine.

HOSPITAL SURVEY AND CONSTRUCTION ACT

With the passage of the Hill-Burton bill (S. 191) there has been formulated the required Federal Hospital Council as well as an advisory board to this council. The Council on Medical Education and Hospitals is represented on this advisory board and will exert its influence in trying to maintain adequate standards of hospital care as well as a wise distribution of hospitals under this law.

MODEL HOSPITAL LICENSING LAW

The Council, in collaboration with the Council on Medical Service and the Bureau of Legal Medicine and Legislation, has participated in the formulation of a model hospital licensing law which was recommended by the Council of State Governments and the American Hospital Association as a guide to the several states now contemplating the licensing of hospitals. The movement toward state licensing of hospitals has been accelerated by the passage of the Hospital Survey and Construction Act, although that act does not specifically require the licensing of hospitals by states.

FOREIGN MEDICAL SCHOOL CREDENTIALS

There has been considerable difficulty in recent years in the evaluation of foreign medical schools and credentials from those schools by such agencies and institutions as the state licensing boards, the National Board of Medical Examiners, the various American boards in the specialties, hospitals offering residencies and others. It has been especially difficult to arrive at a judgment of the quality of foreign schools in the case of European institutions since the advent of Hitler. The Council called together for a discussion of this problem representatives of the Association of American Medical Colleges, Advisory Board for Medical Specialties, Federation of State Medical Boards, National Board of Medical Examiners, United States Office of Education, State Department and New York State Education Department. Although no positive recommendations emerged from the discussions, it was the consensus of the group that our educational resources at the undergraduate level are not so extensive that we can encourage significant numbers of foreign students to study here but that at the graduate level we do have resources for foreign physicians under normal conditions. Some of the extra places established by hospitals for veterans might well be used later for the training of foreign physicians.

It was agreed that a program be initiated in which there will be a preliminary survey of the field as related to the location of each school. Thereafter there might be obtained certain factual information from publications of the schools and from the cultural attachés of the State Department. A questionnaire could then be sent to each school requesting such significant data as premedical requirements, enrolments, faculty members, duration of course and licensure in the country. The result would be the obtaining of basic objective information about each school. Evaluations might then be attempted from other sources. Whether an approved list of foreign schools will emerge from this project is problematical. The material obtained, however, should materially aid many bodies seeking such data. No survey of medical schools as is done in the case of medical schools in the United States and Canada is foreseen.

NATIONAL SOCIETY FOR MEDICAL RESEARCH

The National Society for Medical Research, organized to combat antivivisection propaganda and campaigns, was endorsed by the House of Delegates of the American Medical Association in December 1945. This society is now seeking to augment its financial resources by appealing to state medical societies for financial assistance. The Council believes that this organization deserves the full support of American medicine from the local societies to the national organization. The Council recommends that all possible aid be given to this organization by the state societies. This organization, which has a permanent office and secretariat, has already accomplished a great deal, and there is promise of much greater progress in the education of the public regarding the necessity and humane character of animal experimentation.

ANNUAL CONGRESS ON MEDICAL EDUCATION AND LICENSURE

The forty-third Annual Congress on Medical Education and Licensure was held under the auspices of the Council on Medical Education and Hospitals of the American Medical Association and the Federation of State Medical Boards in February 1947. Papers were presented at this congress on such important topics as the financing and organization of medical schools, the conduct of residency programs in federal hospitals, the relationship of medicine to the general problem of national security in the future, the academic performance of premedical veterans, the Hospital Survey and Construction Act, the responsibilities of a medical school to a community and medical applications of atomic energy. Attendance at the congress numbered approximately 300.

LIAISON COMMITTEE OF THE COUNCIL AND THE ASSOCIATION OF AMERICAN MEDICAL COLLEGES

The Liaison Committee of the Council on Medical Education and Hospitals and the Association of American Medical Colleges, established a few years ago by the Board of Trustees and accepted by the House of Delegates, has continued to hold important discussions two or three times annually to deal with problems of mutual concern to the two organizations. This committee is advisory to the two associations and has resulted in a strengthening of both organizations because it has enabled them to act jointly in important matters pertaining to medical education. For example, inspections of medical schools are carried out jointly by the two organizations. Joint reports on inspections are issued, and identical action is taken by the two groups in cases involving the status of a medical school.

NEW MEDICAL SCHOOLS

The medical school of the University of Washington in Seattle is completing the first year of its operation and will admit its second class this year. This school will be considered for inclusion on the Council's approved list when it is in full operation with four classes in session. In the meantime the Council has continued to advise the institution and is following developments closely.

The University of California will establish a medical school in Los Angeles as part of the University of California at Los Angeles. The plans call for the construction of a 500 bed hospital on the Los Angeles campus of the university where the medical school program will be carried out. Dr. Stafford L. Warren of the University of Rochester School of Medicine and Dentistry has been appointed dean. It is anticipated that the freshman class will commence work in the near future.

In the course of the year 1946 one medical school changed its status. The Medical College of Alabama at Birmingham was approved by the Council as a four year institution. This was formerly an approved school of basic medical sciences. The institution is in full operation and has graduated its first class.

Six of the remaining seven schools of the basic medical sciences are still contemplating expansion to the four year status. South Dakota is now committed to this program and hopes to initiate the work of the junior year soon. Missouri is also committed to an expansion to the four year status, although the decision still remains to be made concerning the location of the school and the date of commencement of instruction of junior medical students.

Entirely new medical schools are under consideration in Connecticut, Florida, Maine, New Jersey, New York and (in Canada) in Saskatchewan and British Columbia. A four year medical school is already in operation at the University of Ottawa. In most instances these discussions are apparently in the early formative stages.

The Council desires to reiterate certain of the axioms which should be borne in mind by those considering establishing new medical schools, as published in the 1946 annual report of the Council to the House of Delegates. It is especially important to bear in mind the high cost of initiating and maintaining a program of medical education at a satisfactory level. It is important also to bear in mind that the distribution of physicians as between rural and urban communities and as between the wealthier and poorer states is not likely to be significantly affected by the establishment of a medical school. The distribution of physicians is more closely related to the per capita income of the area or state and to the availability of hospital and diagnostic facilities than to the existence of a medical school in the area. It is also important to realize that about as many students from states without medical schools find a place in a medical school as is true of states having a medical school, when medical school admissions are computed according to the population, and that the present surplus of medical school graduations over deaths of physicians is such that the overall physician-population ratio is now being maintained at approximately a constant.

HIGH SCHOOL AND COLLEGE CREDITS FOR EDUCATIONAL EXPERIENCES IN THE ARMED FORCES

Many educational opportunities of good quality at both the high school and the college level were available to certain members of the armed forces. There were courses offered by correspondence through the "Armed Forces Institute," which operates in collaboration with colleges and universities as well as other classroom work in various schools operated for men and women in the armed forces. Such work has been carefully evaluated as to content and quality by the American Council on Education, which represents higher education in this country. There has been issued a "Guide to the Evaluation of Educational Experiences in the Armed Forces" to assist colleges desiring to do so to award proper high school and college credits for specific courses taken in this program. In addition to awarding credit for such courses actually taken there is a program for evaluating a veteran's knowledge by the administration of "General Educational Development Tests" and the awarding of appropriate high school and college credit on the basis of the examination results, even though formal course work in the subject matter of the examination was not taken by the candidate. These comprehensive examinations were developed by the Armed Forces Institute and sponsored by the American Council on Education.

The Council on Medical Education and Hospitals has confidence in the American Council on Education and its "Guide to the Evaluation of Educational Experiences in the Armed Forces," in the Armed Forces Institute and in the General Educational Development Tests and wishes to support sound procedures permitting veterans to commence their education in civilian institutions at a level commensurate with their ability and knowledge. Therefore the Council has decided that approved medical schools will not be in conflict with the Council's regulations and policies if they choose to accept certain credits in partial fulfilment of premedical requirements, as follows:

High school credits may be based either on (*a*) courses taken from the Armed Forces Institute or in service courses of the armed forces according to the "Guide to the Evaluation of Educational Experiences in the Armed Forces" of the American Council on Education or (*b*) performance in the General Educational Development Tests of the American Council on Education; such credit may include the equivalent of a complete high school course.

College credits (except in science courses requiring laboratory work or except blanket credits for military services not based on courses or examinations) may be based either on (*a*) courses taken from the Armed Forces Institute or in service courses of the armed forces according to the "Guide to the Evaluation of Educational Experiences in the Armed Forces" of the American Council on Education or (*b*) performance in the General Educational Development Tests of the American Council on Education.

It should be noted that these special provisions apply only to high school and college credits (except in laboratory science courses) and not to regular medical school courses.

It is requested by the Council on Medical Education and Hospitals that the House of Delegates authorize the amendment of the "Essentials of an Acceptable Medical School" in accordance with these provisions in section VII of the "Essentials," which deal with "Requirements for Admission to an Approved Medical School."

COUNCIL PUBLICATIONS

Regular publications of the Council during the year 1946 include:

Hospital Service in the United States
State Board Number of THE JOURNAL
Medical Education in the United States
Compilation of special reprint edition of papers presented for the 1946 Annual Congress on Medical Education and Licensure
Postgraduate Courses for Veteran and Civilian Physicians
Approved Internships
Approved Residencies and Fellowships in the Specialties
Choice of a Medical School
Approved Colleges of Arts and Sciences
Schools for Clinical Laboratory Technicians
Schools for Physical Therapy Technicians
Schools for Occupational Therapy
Schools for Medical Record Librarians
Schools for X-Ray Technicians

The Council also has reprinted for distribution a number of articles not primarily of Council origin dealing with questions relating to the Council's work and responsibilities. In addition, the Council publishes numerous statements in THE JOURNAL from time to time concerning current problems.

CHAIRMAN OF THE COUNCIL

The Constitution and By-Laws of the American Medical Association states that the Council shall elect its own officers. On the expiration of the term of Dr. Ray Lyman Wilbur on the Council, Dr. H. G. Weiskotten of Syracuse was elected Chairman. Dr. Weiskotten is the third chairman of the Council in its entire long history. In electing its new chairman, the Council was fully cognizant of the high standing of Dr. Weiskotten in the field of medical education and of American medicine in general. In addition, Dr. Weiskotten is intimately familiar with all aspects of the work of the Council, having acted as the Council's Secretary for a time. Dr. Weiskotten was Director of the Council's survey of all medical schools in the United States and Canada in the years 1934 to 1936.

SECRETARY OF THE COUNCIL

The Board of Trustees of the American Medical Association, on recommendation of the Council, has appointed Dr. Donald G. Anderson of Boston as the Secretary to replace Dr. Victor Johnson. Dr. Anderson will assume his new position about July 1, 1947.

PROFESSIONAL STAFF CHANGES

The Board of Trustees has promoted Dr. F. H. Arestad from Assistant Secretary of the Council to Associate Secretary. Dr. Arestad supervises the hospital work of the Council.

Dr. H. G. Westmoreland has resigned from the technical staff. Dr. William R. Albus has been added to the staff.

MEDICAL SCHOOLS VISITED

During the calendar year 1946 the following medical schools were visited for consultation, survey or other purposes:

Medical College of Alabama
University of South Dakota School of Medical Sciences
University of Missouri School of Medicine
University of Washington School of Medicine
St. Louis University School of Medicine
University of Utah School of Medicine
University of Minnesota Medical School
University of Colorado School of Medicine
Bowman Gray School of Medicine
University of California at Los Angeles (proposed medical school)
University of British Columbia, Vancouver (proposed medical school)

INSPECTION OF HOSPITALS AND TECHNICAL SCHOOLS

Inspections of hospitals and technical schools made by the Council during the calendar year 1946 may be summarized as follows:

Hospitals	
Intern training	39
Residencies and fellowships	186
Intern training and residencies	24
Registration	13
Total	262
Individual residencies and fellowships investigated	656
Technical Schools	
Clinical laboratory schools	5
Medical Record Librarians schools	1
Occupational therapy schools	1
Physical therapy schools	3
Total	10

During 1946 nearly twice as many individual residencies and fellowships were investigated as was true in 1945.

SUMMARY OF HOSPITALS AND TECHNICAL SCHOOLS

Figures for approved hospitals and technical schools with changes occurring during the calendar year 1946 are as follows:

Registration of Hospitals	
Hospitals registered, Jan. 1, 1946	6,558
New institutions registered during 1946	146
Closed or transferred to unclassified file	310
Hospitals registered, Dec. 31, 1946	6,394
Internship Approval	
Hospitals approved for intern training, Jan. 1, 1946	794
Approved during year	23
Removed from approved list	6
Hospitals approved for intern training, Dec. 31, 1946	811
Residency Approval	
Hospitals approved for residency approval, Jan. 1, 1946	783
Approved during year	181
Removed from approved list	8
Hospitals approved for residency approval, Dec. 31, 1946	956
Clinical Laboratory Schools	
Approved schools, Jan. 1, 1946	266
Approved during year	32
Removed from approved list	5
Approved schools, Dec. 31, 1946	293
Medical Record Librarian Schools	
Approved schools, Jan. 1, 1946	10
Approved during year	1
Removed from approved list	0
Approved schools, Dec. 31, 1946	11
Occupational Therapy Schools	
Approved schools, Jan. 1, 1946	18
Approved during year	1
Removed from approved list	1
Approved schools, Dec. 31, 1946	18
Physical Therapy Schools	
Approved schools, Jan. 1, 1946	23
Approved during year	3
Removed from approved list	1
Approved schools, Dec. 31, 1946	25
X-Ray Schools	
Approved schools, Jan. 1, 1946	129
Approved during year	35
Removed from approved list	3
Approved schools, Dec. 31, 1946	161

COLLABORATION WITH OTHER AGENCIES

For the Council to carry out its work effectively it is necessary to collaborate intimately with numerous agencies and institutions in the field of health, medicine and education, as well as with various governmental bodies at the national and state levels. These conjoint activities have been varied in nature and have involved the Secretary, other members of the staff of the Council and the members of the Council itself. In most instances these cooperative enterprises have involved participation in conferences, advisory committees and joint sessions.

APPRECIATION

The Council on Medical Education and Hospitals of the American Medical Association is able to conduct its important work at a high level only because of the continued and enthusiastic support of the House of Delegates and officers of the American Medical Association. The Council deeply appreciates this support and desires in addition to extend its thanks to the many institutions throughout the country for supplying the Council with information and collaborating with the Council in its extensive inspection program.

Respectfully submitted,

H. G. Weiskotten, Chairman
J. H. Musser.
Harvey B. Stone.
Reginald Fitz.
Russell L. Haden.
Charles Gordon Heyd.
Victor Johnson, Secretary.

REPORT OF THE COUNCIL ON SCIENTIFIC ASSEMBLY

To the Members of the House of Delegates of the American Medical Association:

The Council on Scientific Assembly, and especially its Chairman, was more than usually active during the past year, owing primarily to preparations for the celebration of the Association's Centennial Year. The Council offers the Official Program of the Centennial Celebration as a part of its report.

The work in connection with the compilation of the program was exceptionally heavy for all concerned, mostly because of the Council's decision to invite distinguished physicians of foreign countries to participate in the work of the Scientific Assembly. With the cooperation of the Committee on Centennial Celebration and the Board of Trustees, the Council authorized each section secretary to invite, with the approval of the Council, a distinguished foreign physician to read a scientific paper before his section at Atlantic City. This has been done, and the Official Program contains the names of twenty-two eminent physicians from foreign countries, including England, Sweden, Belgium, Scotland, Mexico, Argentina, Chile, Colombia and Canada. Three of the foreign doctors are to present papers in the General Scientific Meetings.

In addition to the honored foreign guests, the Council requested that each section provide a place on its program for a Centennial Address to be delivered by an especially invited distinguished American physician.

SECTION ON MISCELLANEOUS TOPICS

Requests for the establishment of a Section on Allergy and a Section on Physical Medicine were considered by the Council, and it was thought best to allot to these specialties sessions in the Section on Miscellaneous Topics at the Atlantic City session. The Council appointed a chairman and secretary to be in charge of these sessions and also a chairman and secretary to prepare a program for a Session on the History of Medicine. The programs of these three sessions in the Section on Miscellaneous Topics are included in the Official Program.

ANNUAL CONFERENCE OF SECTION SECRETARIES

The Annual Conference of Section Secretaries with the Council on Scientific Assembly, which usually is held in November or December, was held in September 1946. It was felt that more time than usual would be needed for the preparation of the program for the Centennial Celebration.

Respectfully submitted,

Edward L. Bortz, Chairman.
Clyde L. Cummer.
Charles H. Phifer.
Henry R. Viets.
L. W. Larson.
Morris Fishbein, Editor, The Journal. } Ex officio.
George F. Lull, Secretary. }

REPORT OF THE COUNCIL ON MEDICAL SERVICE

To the Members of the House of Delegates of the American Medical Association:

Since the annual session of the House of Delegates in San Francisco last year the Council on Medical Service has intensified its program of activities. These activities have included special projects referred to the Council by the House of Delegates and the Board of Trustees as well as those functions set forth in the By-Laws of the American Medical Association. The Council presented a full and complete report of its activities at the supplemental session of the House of Delegates in December 1946. Both the report and the supplementary report of the Council were referred to the Reference Committee on Medical Service, and the report of the reference committee approving the report of the Council was approved by the House of Delegates. No effort, except to summarize them, will be made in this report to restate the comments and recommendations carried in the December report.

HEADQUARTERS OFFICE

The Council has been provided with adequate office space. In order to coordinate activities, the director of Associated Medical Care Plans has office space in conjunction with the Council.

The staff at the Chicago office attached to the Council's general activities budget consists of Mr. Thomas A. Hendricks, secretary; Mr. George Cooley, assistant secretary and a secretary and two stenographers. The special activities staff consists of Mr. Howard Brower, Mr. L. S. Kleinschmidt and one stenographer. Mr. Brower is assisting in the prepayment activities, particularly those having to do with private insurance carriers. Mr. Kleinschmidt is engaged in studies of rural enrolment in prepayment plans and of the medical cooperative movement.

REGIONAL CONFERENCES

The Regional Conferences of the Council on Medical Service are one of the most important coordinating efforts in effect today between the American Medical Association and its constituent and component medical societies. Whenever possible the Regional Conferences are coordinated with existing meetings. Since 1944, when the Conferences were originated, twelve have been held in all parts of the United States. Two are at present in the planning stage. The Southern Conference, which was to be held in New Orleans on March 15, 1947, had to be canceled because of conflicting meetings. The Regional Conferences will be resumed early in the fall, and tentative plans call for meetings on the West Coast, in the Southeast and in the South.

PREPAYMENT PLANS

The voluntary prepayment medical care program continues to progress, and at present forty-seven of the forty-eight states, the District of Columbia, Hawaii and Puerto Rico have plans in operation, organized or in the process of development. At present plans are organized in thirty-six states and the District of Columbia. These states are Alabama, California, Colorado, Delaware, Florida, Idaho, Illinois, Indiana, Iowa, Kansas, Louisiana, Massachusetts, Michigan, Minnesota, Missouri, Montana, Nebraska, Nevada, New Mexico, New Hampshire, New Jersey, New York, North Carolina, North Dakota, Ohio, Oklahoma, Oregon, Pennsylvania, South Dakota, Utah, Vermont, Virginia, Texas, Washington, West Virginia and Wisconsin. In addition, the following states are at the planning stage and should develop something within the near future: Arkansas, Arizona, Connecticut, Georgia, Kentucky, Maine, Maryland, Rhode Island, South Carolina, Tennessee and Wyoming.

This widespread acceptance on the part of the medical profession of its share of the responsibility in devising methods for "easing the burden of costly medical care to the public" is extremely encouraging. It means that voluntary prepayment medical care programs should soon be available to large segments of the public throughout the entire United States. It means, too, that the enrolment in medical care plans should increase at an even greater rate than that of the past two years. Along this line it is encouraging to report that eighteen plans in operation a year or more reported over 100 per cent increase in enrolment during 1946. Another encouraging development is the fact that a number of the plans have reached a stage in enrolment where experimentation can be carried further than has been possible in the past. As of Dec. 31, 1946 five plans had over a quarter of a million participants each, and seven other plans have between 100,000 and 200,000 participants each. The total enrolment as of January 1947 was approximately 5,000,000 as compared to 2,840,000 in January 1946. The Seal of Acceptance has been granted to fifty-two voluntary prepayment medical care plans approved by state and county medical societies. To date the Seal has been granted only to those plans in the so-called nonprofit category. Within the year, however, the Council will be faced with the problem of considering applications from medical society approved plans underwritten by private insurance carriers and group practice plans approved by local medical societies. Private insurance carrier underwritten plans have been approved by state medical societies in Arkansas, Illinois, South Dakota and Wisconsin and are under consideration in Connecticut, Maine, Minnesota, Rhode Island and Tennessee. This type of program has also been approved by at least one county medical society.

Group practice plans are in operation in many areas and in some instances have received the approval of local medical societies. One application from a group practice prepayment plan has been submitted to the Council.

Standards under which the Seal of Acceptance is granted have given rise to some controversy among those plans operating under nonprofit legislation, particularly those plans working closely with Blue Cross hospital plans. In these standards the Council has omitted the term nonprofit and in its place substituted the following: "The Plan should be organized and operated to provide the greatest possible benefits in medical care to the subscriber. Honesty of purpose and sincere consideration of mutual interests on the part of the subscribers, the physicians and the plans are presupposed as necessary considerations for successful operation." The Council further interpreted this by the following: "The adequacy of the benefits offered to subscribers (or members) shall be based on the following: 1. Percentage of earned income returned to the subscribers, such percentage to include claims paid and reserves for unpaid or anticipated claims. 2. The contractual restrictions and limitations. 3. The interpretation of the benefits provided in the contract." The Standards of Acceptance have been approved by the House of Delegates. The Council realizes that changes in the standards will be necessary as experience is gained in effecting them but feels that they are adequate for the present.

The Council is of the opinion that, despite the success of the voluntary prepayment plan movement, it is still in the experimental stage. Plans have taken a variety of forms. Experiments are in process with reference to individual enrolment, expansion of benefits, types of plans, reciprocity between plans and many other aspects of prepayment insurance. The Council has and will continue to follow these as well as other developments. Staff members have utilized data and ideas gained from these developments in assisting both state association and county medical society prepayment plan committees. Assistance is currently being given in a special rural community enrolment experiment in order to gather data and gain experience for use by all plans. The Council is also of the opinion that the form of such experiments should be left to the state or county medical societies, depending on their judgment as to the type of plan or project which best fits the needs of a particular community or area. Every effort is being made to stimulate experimentation and to gather together the results of such projects for tabulation and evaluation. Only in this manner can the voluntary prepayment movement progress.

NATIONAL HEALTH CONGRESS AND HEALTH COUNCILS

The Council reported to the House of Delegates at its supplemental session in December on the inadvisability of a permanent body such as a National Health Congress and recommended that the House rescind its previous instructions to the Council to proceed with the establishment of such a congress. This action was rescinded in accord with the recommendation of the Council. The Council, however, will continue to gather data and statistics with reference to state and local health council. The study to date indicates a widespread increase in health councils on both the state and county levels. As in prepayment programs, there is a wide diversity in health councils. They differ in type, purpose, activity and composition. Again, as in prepayment, the Council believes that a variety of experiments is healthy and essential. On the completion of this study the Council will make recommendations to the House of Delegates concerning the value, a model program and the scope of activity of such councils.

SPEAKERS' BUREAU

In its December report the Council made reference to the possibility of conducting a "briefing course" at American Medical Association headquarters for key physicians from state medical associations. Contact has been made with the state medical associations, and twenty-two were found to be favorable to the suggestion. The press of activities and the conflicts in meeting dates have made it impossible to make definite plans for such a project. The nearest possible date feasible seems to be early fall.

UNITED MINE WORKERS' HEALTH FUND

Little actual change has taken place in the situation concerning the United Mine Workers' Health Fund since the San Francisco session. The Council has followed the situation closely, awaiting the release of the Boone survey. The A fund, which has to do with welfare and retirement, continues to accumulate in escrow. With reference to the B fund, nothing definite has yet been done. The trustees have not been appointed and at present, under government operation, the mine managers appointed by the administrators are authorized to carry on all activities of the mines. Any physicians who wish to negotiate new contracts may do so with these managers if they already have a contract with the owners. If their contract was with the miners, they of course would negotiate with them. This also applies to hospital contracts. In many places contracts have been renegotiated between physicians and hospitals on the one hand and coal operators or local unions on the other. In general, these renegotiations have been necessary to meet the increased cost of medical care. In a few instances existing contracts have been terminated without making new contracts. The negotiating committee of the National Coal Association has been dissolved. Mr. Lewis signified his intention of entering into no new negotiation of the contract until his case before the Supreme Court is settled.

Representatives of the Council on Medical Service have met informally with representatives of the United Mine Workers' union and of the mine operators. The purpose of these informal conferences was to explore the attitudes of both groups with the hope of arriving at some reasonable and acceptable plan of action to be followed at such time as the mines are returned to private ownership and negotiations can be resumed. In general the discussions have centered around the idea that perhaps boards might be set up for each district consisting of six men, two representing the union, two representing the operators and two representing the medical profession. The two professional members need not necessarily be engaged in mine practice but might well represent the entire medical profession in the area. The board would not have administrative functions but would act as a review or appeals board, with duties somewhat as follows:

1. To review contracts now in existence or in the process of negotiation.

2. To make recommendations for increasing or decreasing the amount of the check-off in order to provide adequate medical care at as reasonable a cost as is possible.

3. To assist in providing reciprocity for transfer of patients between hospitals when necessary service is not available in the local hospital.

4. To assist in integrating the hospital and medical service for mine workers with the health activities of the community as a whole.

5. To cooperate with local, state and federal health services to improve the quality of preventive medical services within the area.

BULLETINS, NEWS LETTERS AND STUDIES

News Letter.—The News Letter of the Council continues to increase in popularity. There is every indication that it is one of the American Medical Association's most valuable contacts with state and county medical society officers. The mailing list has continued to increase in size, with the addition not only of physicians but of members of the Woman's Auxiliary, special professional societies and laymen who are interested in medical service activities. During 1946 the Council published twelve issues of the News Letter covering a large variety of subjects of interest to medical organizations and physicians. Several of the News Letters were devoted to specific subjects warranting detailed consideration. Examples are "Rural Health in America," "Success of the Hill-Burton Program Depends on State Action," "Prepayment Medical Care Plans" and "Cancer Control." Special News Letters have been sent out from time to time calling attention to or reporting on current projects. With each News Letter the Council has made an effort to include articles and reprints on pertinent subjects.

Prepayment Medical Care Plan Brochure.—The Council has completed a revised edition of the brochure "Voluntary Prepayment Medical Care Plans." (The 5,000 copies of the 1946 edition were not sufficient to fill requests received.) The new edition contains a description of sixty-four plans, as compared to fifty-five in the earlier edition. The brochure also includes a short history of the prepayment plan movement, the official actions of the House of Delegates on prepayment and a limited analysis of certain aspects of prepayment plan characteristics. Because of the interest in this subject on the part of the general public, the Council plans to publish sufficient copies to supply at least a portion of the high schools, universities and public libraries with the revised edition.

Prepayment Chart Pamphlet.—One of the problems that speakers or writers on the subject of prepayment medical care plans encounter is the lack of overall statistics concerning the prepayment movement. To assist those preparing material on the subject the Council has prepared a series of charts and diagrams presenting data on the prepayment plan program. These charts and diagrams will provide information, in visual form, on the growth in enrolment and in the number of plans, and on the experience and characteristics of prepayment plans generally and a comparison with the growth of Blue Cross hospital plans.

Cash Sickness Benefits.—Interest in and legislation concerning insurance against loss of wages during sickness indicate a need for a study of the subject. The Board of Trustees has referred the matter to the Council.

Council Exhibit.—The Council has prepared an exhibit for the Atlantic City session. Divided into three parts, the exhibit will include material on prepayment, the Ten Point Program, and state and county medical society activities.

Compulsory Sickness Insurance.—"Compulsory Sickness Insurance" has been the subject for debate in high schools and universities during the past school year. As a result the Council has received thousands of requests for information. To meet the situation the Council has published a pamphlet containing twenty-three articles presenting arguments against compulsory sickness insurance. To assist debaters, physicians and others in arranging material on the subject, an outline was published in card form and, in addition, reprints of some articles were obtained for distribution in cases in which additional information was necessary. From September 1946 to April 1947 over 21,000 copies of the Council's publications and over 6,000 copies of supplementary material in reprint form were mailed on request. The Council is at present preparing for publication a compilation of the many studies on compulsory sickness insurance programs now in operation and on related subjects.

Physicians' Liability, or Malpractice, Insurance.—Many inquiries have been received by the Association and referred to the Council on Medical Service regarding physicians' liability, or malpractice, insurance. The basis for these inquiries seemed to be that certain insurance companies were either discontinuing the writing of this coverage or were reducing the limits of liability to such an extent that many physicians felt they did not have adequate protection.

The Council undertook a study to determine which insurance companies were utilizing their charter power to write this type of insurance. An effort was also made to determine what liability limits were available to the medical profession. Because of the highly specialized nature of this type of insurance it was impossible to receive definite liability commitments from all carriers, but sufficient data was accumulated to give a basis for answering inquries. In addition to the direct inquiries made from the Council office, the American Mutual Alliance canvassed its membership to make the survey more complete. Sixty-two direct inquiries were sent out from the Council office. Twenty-one companies indicated that they were writing the coverage, thirty-three replied negatively, one stated that plans were under way and no replies were received from the other seven.

Cooperatives.—In accordance with the request of the Board of Trustees the Council is working with the Bureau of Medical Economic Research in a study of medical cooperatives. The purpose of this study will be to determine the possibility of formulating standards for this particular type of medical practice.

Cancer Programs.—The Council has worked closely with Dr. James R. Miller in a study of the Service Program of the American Cancer Society. At the December meeting of the House of Delegates the Council made recommendations which were approved by the House of Delegates. Subsequently the Council has completed a special News Letter with suggestions in detail concerning the activities of state and county medical societies with reference to American Cancer Society funds. The activities of various state and county medical societies in the field of cancer control will continue to be followed.

Private Insurance Conferences.—No formal meetings with private insurance associations have been held since December 1946. The Council has made an effort to maintain contact in this field by informal personal meetings and correspondence. It is understood that the simplified claim blank referred to in the Council's report in December will soon be resubmitted. The Health and Accident Underwriters Conference and the International Claim Association have collaborated on a simplified standard hospitalization insurance claim blank, which has been approved by the American Hospital Association.

TAFT-SMITH-BALL-DONNELL BILL

In the fall of 1946 the Council invited suggestions with respect to the Taft-Smith-Ball-Donnell bill from the various state medical associations. These suggestions, together with some obtained from other sources, were turned over to the Bureau of Legal Medicine and Legislation to be used in conferences with Senator Taft before the resubmission of his bill in the present Congress. The bill has been resubmitted and an analysis has been made by the Bureau of Legal Medicine and Legislation.

HILL-BURTON ACT

At the December meeting of the House of Delegates the Council submitted suggested principles, formulated with the aid of the Council on Medical Education and Hospitals and the Bureau of Information, to guide medical societies in their cooperation with the hospital construction program of the Hill-Burton Act. In this report the Council outlined the background of its assignment concerning the Hill-Burton program, set forth general recommendations to the House and outlined specific recommendations as to the definition and operation of health centers. This report, with several specific changes, was approved. Development of facilities under the Hill-Burton Act are, generally, awaiting surveys to be made in each of the states. The Bureau of Legal Medicine and Legislation is following the actions of the state legislatures in providing survey funds and has prepared an analysis and digest of the regulations. Full utilization of the funds provided for in the Hill-Burton Act must await further efforts on the part of the states. The Council, with the assistance of the Council on Medical Education and Hospitals and the Bureau of Information, will continue to keep in touch with the program and report developments.

Because of the importance of this subject the House of Delegates recommended that a survey and inspection of existing health centers be made to determine the nature of the services rendered and the necessity of such services in relation to other existing facilities. The survey has been completed by Dr. Dean F. Smiley.

THE WASHINGTON OFFICE

The Washington Office of the Council on Medical Service strives diligently to serve individual members of the Association and the several constituent associations. Mr. D. Michael Perry, familiar with legislative processes and governmental activities, has been secured as assistant to the Director, Dr. Joseph S. Lawrence. Many requests for information have been received from the public, the medical profession and members of Congress in regard to pending health legislation.

With every new Congress there have been changes, but the Eightieth Congress has had the additional problem of reorganization. It has taken time to get started but is now well under way. The Bulletin of the Washington Office has reported the introduction and progress of all measures relating to public health or to the practice of medicine. From time to time dates of hearings on pendings bills and summaries of statements made by witnesses are reported.

A total of 4,611 measures were introduced in both houses of Congress up to April 1, 1947. Of these this Office has reported on 73. Most important among them are:

S. 140, a modified version of S. 2503, which Senators Taft and Fulbright introduced in the last Congress, proposes the establishment of a Department of Health, Education and Security of cabinet status. It sets up separate divisions of health, education and security each headed by an under secretary who would be a recognized authority in his respective field.

S. 712 simply reconstitutes the Federal Security Agency as an executive department of cabinet rank. Hearings on both these bills have just been concluded by the Committee on Expenditures in Executive Departments, and abstracts of statements made at the hearings have been sent to all those who are on the Bulletin mailing list.

Bills providing for the creation of a National Science Foundation have been introduced, and of these S. 526 merits special attention since it has been reported out of committee with amendments. Two bills employing this title were considered by the Seventy-Ninth Congress; one of them, S. 1850, passed the Senate. S. 526 establishes a foundation of twenty-four members prominent in the fields of science, engineering, education and public welfare for the support of basic research, the award of scholarships and other purposes. Five administrative divisions, each devoted to a separate general field, will be set up; (1) medical research, (2) mathematical, physical and engineering sciences, (3) biologic sciences, (4) national defense and (5) scientific personnel and education. The foundation is given latitude to create new divisions as may be necessary or desirable in order to meet changing circumstances.

Another series of bills which received serious attention by the Seventy-Ninth Congress related to discovery and treatment of cancer in human beings. Four such bills pending in the present Congress authorize the appropriation of $50,000,000 to $100,000,000 for the purpose. It is said that Senator Taft and associates are engaged in drafting another bill which they will soon introduce. The House Committee on Appropriations recognized the public interest in the matter and materially increased appropriations to the Public Health Service for extension of the National Cancer Institute and erection of a new building.

Reports are widespread of the reintroduction of the Wagner-Murray-Dingell bill with certain amendments to meet objections raised at the extensive hearings held during the last Congress, but thus far these reports have not been proved. It is quite possible that it will be introduced about the time that hearings begin on S. 545, the National Health Act of 1947. At present writing that date has not been selected. The committee to which S. 545 was referred has announced that it will devote at least two weeks to public hearings, hoping to give every one who wishes to do so an opportunity to testify.

Responding to the suggestion by the President that there should be a unification of the armed services, several bills have been drafted with that objective. Some of these bills have been discussed in public hearings and have received considerable public support. The services themselves are sympathetic to the movement with the proviso that the individuality of their particular services should not be destroyed. The general idea is that for the unification of defense activities there should be created a National Defense Establishment composed of a secretary, appointed by the President, and a representative of each service and of the Commander-in-Chief, designated the Joint Chiefs of Staff. The Joint Chiefs of Staff shall act as the principal military advisers to the President and to the Secretary of National Defense. A further suggestion which arose out of the hearings is that there should be included with the Joint Chiefs of Staff a representative of the combined medical services. This idea has not been framed into a bill as yet, but it seems to be developing strength.

During the past year the Washington Office has undertaken to develop a closer relationship with those government departments and agencies which engage in public health activities. There were thirty-seven such agencies according to a report submitted in 1946 by Senator Byrd. Five were abolished by the Reorganization Act.

Government Medical Service.—Under the Employees Health Service Act (Public Law 658, Seventy-Ninth Congress, August 8, 1946) federal agencies may provide preventive medical services at no expense to the employee. The service includes treatment on the job for illness and dental work requiring emergency attention, preemployment and periodic medical examinations, referral of patients to private physicians and dentists and preventive health education. To perform these activities agencies may either employ at full time their own physicians and health personnel or may contract in whole or in part with other federal agencies or with private or public organizations capable of rendering the required services. The act assigns to the Public Health Service the responsibility for providing consultation services to federal agencies and for making recommendations if requested to do so. Many agencies have already called on the Public Health Service to appraise their health needs as a basis for establishing preventive medical programs for employees. It is estimated that two years will be needed to complete these surveys. For this purpose an appropriation of $901,000 was requested by the Public Health Service. The House, however, acepted the Appropriations Committee's recommendation of $300,000.

Prior to the enactment of this law there were sixteen agencies operating health programs for their employees with the use of nurses, and in several instances doctors were assigned by the Public Health Service on a reimbursement basis. At the present time there are 125 emergency rooms in operation employing 250 nurses, existing as "temporary interim programs" until such time as programs are approved and appropriations secured. The Treasury Department initiated such service as early as 1918 and at present conducts eleven health units employing forty people—five doctors, twenty-eight nurses, four clerks and three matrons. Their program comprises preventive medicine, personal consultation on health problems with employ-

4. To assist in integrating the hospital and medical service for mine workers with the health activities of the community as a whole.

5. To cooperate with local, state and federal health services to improve the quality of preventive medical services within the area.

BULLETINS, NEWS LETTERS AND STUDIES

News Letter.—The News Letter of the Council continues to increase in popularity. There is every indication that it is one of the American Medical Association's most valuable contacts with state and county medical society officers. The mailing list has continued to increase in size, with the addition not only of physicians but of members of the Woman's Auxiliary, special professional societies and laymen who are interested in medical service activities. During 1946 the Council published twelve issues of the News Letter covering a large variety of subjects of interest to medical organizations and physicians. Several of the News Letters were devoted to specific subjects warranting detailed consideration. Examples are "Rural Health in America," "Success of the Hill-Burton Program Depends on State Action," "Prepayment Medical Care Plans" and "Cancer Control." Special News Letters have been sent out from time to time calling attention to or reporting on current projects. With each News Letter the Council has made an effort to include articles and reprints on pertinent subjects.

Prepayment Medical Care Plan Brochure.—The Council has completed a revised edition of the brochure "Voluntary Prepayment Medical Care Plans." (The 5,000 copies of the 1946 edition were not sufficient to fill requests received.) The new edition contains a description of sixty-four plans, as compared to fifty-five in the earlier edition. The brochure also includes a short history of the prepayment plan movement, the official actions of the House of Delegates on prepayment and a limited analysis of certain aspects of prepayment plan characteristics. Because of the interest in this subject on the part of the general public, the Council plans to publish sufficient copies to supply at least a portion of the high schools, universities and public libraries with the revised edition.

Prepayment Chart Pamphlet.—One of the problems that speakers or writers on the subject of prepayment medical care plans encounter is the lack of overall statistics concerning the prepayment movement. To assist those preparing material on the subject the Council has prepared a series of charts and diagrams presenting data on the prepayment plan program. These charts and diagrams will provide information, in visual form, on the growth in enrolment and in the number of plans, and on the experience and characteristics of prepayment plans generally and a comparison with the growth of Blue Cross hospital plans.

Cash Sickness Benefits.—Interest in and legislation concerning insurance against loss of wages during sickness indicate a need for a study of the subject. The Board of Trustees has referred the matter to the Council.

Council Exhibit.—The Council has prepared an exhibit for the Atlantic City session. Divided into three parts, the exhibit will include material on prepayment, the Ten Point Program, and state and county medical society activities.

Compulsory Sickness Insurance.—"Compulsory Sickness Insurance" has been the subject for debate in high schools and universities during the past school year. As a result the Council has received thousands of requests for information. To meet the situation the Council has published a pamphlet containing twenty-three articles presenting arguments against compulsory sickness insurance. To assist debaters, physicians and others in arranging material on the subject, an outline was published in card form and, in addition, reprints of some articles were obtained for distribution in cases in which additional information was necessary. From September 1946 to April 1947 over 21,000 copies of the Council's publications and over 6,000 copies of supplementary material in reprint form were mailed on request. The Council is at present preparing for publication a compilation of the many studies on compulsory sickness insurance programs now in operation and on related subjects.

Physicians' Liability, or Malpractice, Insurance.—Many inquiries have been received by the Association and referred to the Council on Medical Service regarding physicians' liability, or malpractice, insurance. The basis for these inquiries seemed to be that certain insurance companies were either discontinuing the writing of this coverage or were reducing the limits of liability to such an extent that many physicians felt they did not have adequate protection.

The Council undertook a study to determine which insurance companies were utilizing their charter power to write this type of insurance. An effort was also made to determine what liability limits were available to the medical profession. Because of the highly specialized nature of this type of insurance it was impossible to receive definite liability commitments from all carriers, but sufficient data was accumulated to give a basis for answering inquries. In addition to the direct inquiries made from the Council office, the American Mutual Alliance canvassed its membership to make the survey more complete. Sixty-two direct inquiries were sent out from the Council office. Twenty-one companies indicated that they were writing the coverage, thirty-three replied negatively, one stated that plans were under way and no replies were received from the other seven.

Cooperatives.—In accordance with the request of the Board of Trustees the Council is working with the Bureau of Medical Economic Research in a study of medical cooperatives. The purpose of this study will be to determine the possibility of formulating standards for this particular type of medical practice.

Cancer Programs.—The Council has worked closely with Dr. James R. Miller in a study of the Service Program of the American Cancer Society. At the December meeting of the House of Delegates the Council made recommendations which were approved by the House of Delegates. Subsequently the Council has completed a special News Letter with suggestions in detail concerning the activities of state and county medical societies with reference to American Cancer Society funds. The activities of various state and county medical societies in the field of cancer control will continue to be followed.

Private Insurance Conferences.—No formal meetings with private insurance associations have been held since December 1946. The Council has made an effort to maintain contact in this field by informal personal meetings and correspondence. It is understood that the simplified claim blank referred to in the Council's report in December will soon be resubmitted. The Health and Accident Underwriters Conference and the International Claim Association have collaborated on a simplified standard hospitalization insurance claim blank, which has been approved by the American Hospital Association.

TAFT-SMITH-BALL-DONNELL BILL

In the fall of 1946 the Council invited suggestions with respect to the Taft-Smith-Ball-Donnell bill from the various state medical associations. These suggestions, together with some obtained from other sources, were turned over to the Bureau of Legal Medicine and Legislation to be used in conferences with Senator Taft before the resubmission of his bill in the present Congress. The bill has been resubmitted and an analysis has been made by the Bureau of Legal Medicine and Legislation.

HILL-BURTON ACT

At the December meeting of the House of Delegates the Council submitted suggested principles, formulated with the aid of the Council on Medical Education and Hospitals and the Bureau of Information, to guide medical societies in their cooperation with the hospital construction program of the Hill-Burton Act. In this report the Council outlined the background of its assignment concerning the Hill-Burton program, set forth general recommendations to the House and outlined specific recommendations as to the definition and operation of health centers. This report, with several specific changes, was approved. Development of facilities under the Hill-Burton Act are, generally, awaiting surveys to be made in each of the states. The Bureau of Legal Medicine and Legislation is following the actions of the state legislatures in providing survey funds and has prepared an analysis and digest of the regulations. Full utilization of the funds provided for in the Hill-Burton Act must await further efforts on the part of the states. The Council, with the assistance of the Council on Medical Education and Hospitals and the Bureau of Information, will continue to keep in touch with the program and report developments.

Because of the importance of this subject the House of Delegates recommended that a survey and inspection of existing health centers be made to determine the nature of the services rendered and the necessity of such services in relation to other existing facilities. The survey has been completed by Dr. Dean F. Smiley.

THE WASHINGTON OFFICE

The Washington Office of the Council on Medical Service strives diligently to serve individual members of the Association and the several constituent associations. Mr. D. Michael Perry, familiar with legislative processes and governmental activities, has been secured as assistant to the Director, Dr. Joseph S. Lawrence. Many requests for information have been received from the public, the medical profession and members of Congress in regard to pending health legislation.

With every new Congress there have been changes, but the Eightieth Congress has had the additional problem of reorganization. It has taken time to get started but is now well under way. The Bulletin of the Washington Office has reported the introduction and progress of all measures relating to public health or to the practice of medicine. From time to time dates of hearings on pendings bills and summaries of statements made by witnesses are reported.

A total of 4,611 measures were introduced in both houses of Congress up to April 1, 1947. Of these this Office has reported on 73. Most important among them are:

S. 140, a modified version of S. 2503, which Senators Taft and Fulbright introduced in the last Congress, proposes the establishment of a Department of Health, Education and Security of cabinet status. It sets up separate divisions of health, education and security each headed by an under secretary who would be a recognized authority in his respective field.

S. 712 simply reconstitutes the Federal Security Agency as an executive department of cabinet rank. Hearings on both these bills have just been concluded by the Committee on Expenditures in Executive Departments, and abstracts of statements made at the hearings have been sent to all those who are on the Bulletin mailing list.

Bills providing for the creation of a National Science Foundation have been introduced, and of these S. 526 merits special attention since it has been reported out of committee with amendments. Two bills employing this title were considered by the Seventy-Ninth Congress; one of them, S. 1850, passed the Senate. S. 526 establishes a foundation of twenty-four members prominent in the fields of science, engineering, education and public welfare for the support of basic research, the award of scholarships and other purposes. Five administrative divisions, each devoted to a separate general field, will be set up; (1) medical research, (2) mathematical, physical and engineering sciences, (3) biologic sciences, (4) national defense and (5) scientific personnel and education. The foundation is given latitude to create new divisions as may be necessary or desirable in order to meet changing circumstances.

Another series of bills which received serious attention by the Seventy-Ninth Congress related to discovery and treatment of cancer in human beings. Four such bills pending in the present Congress authorize the appropriation of $50,000,000 to $100,000,000 for the purpose. It is said that Senator Taft and associates are engaged in drafting another bill which they will soon introduce. The House Committee on Appropriations recognized the public interest in the matter and materially increased appropriations to the Public Health Service for extension of the National Cancer Institute and erection of a new building.

Reports are widespread of the reintroduction of the Wagner-Murray-Dingell bill with certain amendments to meet objections raised at the extensive hearings held during the last Congress, but thus far these reports have not been proved. It is quite possible that it will be introduced about the time that hearings begin on S. 545, the National Health Act of 1947. At present writing that date has not been selected. The committee to which S. 545 was referred has announced that it will devote at least two weeks to public hearings, hoping to give every one who wishes to do so an opportunity to testify.

Responding to the suggestion by the President that there should be a unification of the armed services, several bills have been drafted with that objective. Some of these bills have been discussed in public hearings and have received considerable public support. The services themselves are sympathetic to the movement with the proviso that the individuality of their particular services should not be destroyed. The general idea is that for the unification of defense activities there should be created a National Defense Establishment composed of a secretary, appointed by the President, and a representative of each service and of the Commander-in-Chief, designated the Joint Chiefs of Staff. The Joint Chiefs of Staff shall act as the principal military advisers to the President and to the Secretary of National Defense. A further suggestion which arose out of the hearings is that there should be included with the Joint Chiefs of Staff a representative of the combined medical services. This idea has not been framed into a bill as yet, but it seems to be developing strength.

During the past year the Washington Office has undertaken to develop a closer relationship with those government departments and agencies which engage in public health activities. There were thirty-seven such agencies according to a report submitted in 1946 by Senator Byrd. Five were abolished by the Reorganization Act.

Government Medical Service.—Under the Employees Health Service Act (Public Law 658, Seventy-Ninth Congress, August 8, 1946) federal agencies may provide preventive medical services at no expense to the employee. The service includes treatment on the job for illness and dental work requiring emergency attention, preemployment and periodic medical examinations, referral of patients to private physicians and dentists and preventive health education. To perform these activities agencies may either employ at full time their own physicians and health personnel or may contract in whole or in part with other federal agencies or with private or public organizations capable of rendering the required services. The act assigns to the Public Health Service the responsibility for providing consultation services to federal agencies and for making recommendations if requested to do so. Many agencies have already called on the Public Health Service to appraise their health needs as a basis for establishing preventive medical programs for employees. It is estimated that two years will be needed to complete these surveys. For this purpose an appropriation of $901,000 was requested by the Public Health Service. The House, however, acepted the Appropriations Committee's recommendation of $300,000.

Prior to the enactment of this law there were sixteen agencies operating health programs for their employees with the use of nurses, and in several instances doctors were assigned by the Public Health Service on a reimbursement basis. At the present time there are 125 emergency rooms in operation employing 250 nurses, existing as "temporary interim programs" until such time as programs are approved and appropriations secured. The Treasury Department initiated such service as early as 1918 and at present conducts eleven health units employing forty people—five doctors, twenty-eight nurses, four clerks and three matrons. Their program comprises preventive medicine, personal consultation on health problems with employees, on-the-job treatment of injuries and simple treatment. An appropriation of $138,700 to continue this program for 21,510 employees in the District of Columbia has been requested.

On numerous occasions the Washington Office has been called on to submit information and material on sickness insurance programs to schools, organizations, individuals and members of Congress.

Respectfully submitted,

E. J. McCormick, Chairman.
Alfred W. Adson.
Walter B. Martin.
Thomas A. McGoldrick.
James R. McVay.
Raymond L. Zech.
George F. Lull.
H. H. Shoulders.
Roger I. Lee.
Louis H. Bauer.
Thomas A. Hendricks, Secretary.

REPORT OF COMMITTEE ON CENTENNIAL CELEBRATION

To the Members of the House of Delegates of the American Medical Association:.

This is a further report of the progress made by the Committee on Centennial Celebration appointed by President Shoulders in December 1945 to formulate a program for the annual session to be held in Atlantic City in June 1947 to celebrate the centenary of the founding of the American Medical Association. A preliminary report submitted to the House of Delegates at its meeting in December 1946 outlined the general plan adopted.

The Committee is happy to state that this preliminary plan has been followed with practically no change, except perhaps in individuals selected for certain sections of the program. As has been previously stated, a dinner will be given by the Board of Trustees of the American Medical Association on Saturday, June 7, at the Hotel Traymore in honor of leaders in affiliated professions, industries and other public services. The Chairman of the Board of Trustees will preside. We are fortunate in securing the presence of Mr. Basil O'Connor, chairman of the American Red Cross and president of the National Foundation for Infantile Paralysis, Gen. Omar Bradley, director of the Veterans Administration, and Mr. H. W. Prentis Jr., president of the Armstrong Cork Company and past president of the National Association of Manufacturers, who have agreed to address the gathering. It is hoped that arrangements can be completed for broadcasting these three addresses over a national network. On Sunday, June 8, at 11:30 a. m., a special religious service will be held in Convention Hall. There will be an organ recital followed by addresses to be given by Dr. Ralph Cooper Hutchison, President of Lafayette College, Rabbi Joshua Liebman, author of the popular book "Peace of Mind," and Right Reverend Monsignor Fulton J. Sheen, professor of philosophy at Catholic University. These three men are eloquent speakers and well known throughout the country. From 11 to 11:30 that morning they will be heard over the National Broadcasting Company network.

On Monday evening a dinner will be given to the House of Delegates by the Board of Trustees, and the speeches will be carried over the Mutual Broadcasting System.

The General Scientific Meetings will begin on Monday afternoon and continue throughout Tuesday. Listed on this program are Sir Howard Florey, Professor Herbert John Seddon, both of Oxford, England, and Professor George W. Pickering of London. The General Meeting on Tuesday night will be held in Convention Hall at 8 o'clock, at which time the Philadelphia Festival Orchestra, conducted by Alexander Hilsberg, will provide music which it is felt certain will greatly please those in attendance. The President's address will be delivered by Dr. Edward L. Bortz, who became President-Elect on the resignation of Dr. Olin West. The retiring President, Dr. Harrison H. Shoulders, will receive the President's medal. Then the Distinguished Service Medal of the Association, which is awarded annually, will be presented. This will be followed by the introduction of the distinguished foreign guests appearing on the scientific program.

The programs of the scientific sections have been arranged by the section officers under the general supervision of Dr. Edward L. Bortz, Chairman of the Council on Scientific Assembly. By direction of the Committee on Centennial Celebration, each section has chosen a member to deliver a centennial address before its members. This special paper will deal with the progress and development of the specialty concerned during the past hundred years. These papers will preserve the story of the growth and progress of the specialties and will be an intimate story of contemporary medical history. The many other papers and the number of symposiums have been arranged to include an eminent foreign guest on the program of each of the scientific sections. There will be, in addition, three sessions in the Section of Miscellaneous Topics which should be especially interesting to every physician. The first will be on the history of medicine, the second on physical medicine and the third on allergy. There will be meetings on preventive and industrial medicine and public health, a subject of much concern to the general public. The officers of the section have developed an unusual, timely, instructive and interesting program. Attention is called also to the joint meeting of the Section on Internal Medicine and the Section on Experimental Medicine and Therapeutics, which will take place on Friday, June 12. The subject to be discussed on this occasion is "What's New in Medicine?" Symposiums covering many subjects, such as cancer research, virus diseases, therapeutic abortion, liver disease and ulcerative colitis, are on the program. For this unusual schedule of interesting meetings covering all the scientific aspects of general medicine we are indebted to Dr. Bortz and the officers of the various sections. The foreign guests who will be present on this occasion have been selected with great care and are prominent in their particular fields of medicine.

Wednesday night, June 11, has been reserved for the different alumni associations, fraternities and similar groups that they may hold their usual reunions and social gatherings.

On Thursday night, June 12, a reception and ball will be tendered to the retiring President, the incoming President and the President-Elect of the Association. The music for this reception, which will be held in the Ballroom of Convention Hall, will be furnished by two of the country's leading orchestras, well known for the high quality of their musical numbers.

Through the good offices of Hon. Robert Hannegan, Postmaster General of the United States, a commemorative stamp has been issued in recognition of the work done by the American Medical Association for the past hundred years. This is a mark of great distinction and honor to the doctors who have served the nation not only in times of peace but during five different wars. It is indeed gratifying to see the record of their unselfish devotion so well appreciated by those high in governmental service.

Lastly there will be another feature of the centennial which will do much to make the meeting remembered. That is the publication of the "History of the American Medical Association", a book of approximately 1,200 pages, with many interesting illustrations and references. The remarkable growth and progress made by our organization during the hundred years of its existence are described. The history, edited by Dr. Morris Fishbein, has been published in serial form in The Journal of the American Medical Association.

Respectfully submitted,

Edward R. Cunniffe, Chairman.
Thomas P. Murdock.
Thomas S. Cullen.
Warren F. Draper.
Walter F. Donaldson.
William J. Carrington.

ORGANIZATION SECTION

Washington Letter

(From a Special Correspondent)

May 10, 1947.

President Truman Reported to Favor Health, Education, Security Cabinet Post

Mrs. Eugene Meyer, wife of the owner of the Washington *Post,* told reporters following a White House conference that President Truman had expressed hope that a new cabinet post on health, education and security would be established soon. She said the President stressed that the final bill must be workable from an administrative point of view. Mrs. Meyer said they discussed a compromise between the Taft-Fulbright and the Aiken bills, both of which would create a new cabinet secretaryship with jurisdiction of health, education and security.

Opposition to Further Expansion of Veterans Hospital System

The American Hospital Association states in a study sent to all members of Congress and others planning national hospital service that it is opposed to further expansion of the Veterans Administration hospital system on the ground that it would injure normal development of nonfederal hospitals. The study charges that "development of the Veterans Administration program has proceeded on the basis of minimal integration with other federal hospital systems and none whatever with the nonfederal hospital system." It is also pointed out that veterans' hospitals now have 114,433 beds and that when authorized new construction is completed, they will have 150,000, possibly by 1951. This would be more than 10 per cent of the total.

Advocation of Better Planning in Cancer Research

Five million dollars was slashed from the $17,000,000 appropriation for the National Cancer Institute by a Senate appropriation subcommittee after James S. Adams, representing the American Cancer Society, said he thought the 17 million dollar item was too large. Dr. R. E. Dyer, director of the National Institute of Health, who has jurisdiction over the cancer institute in the U. S. Public Health Service, indicated surprise at Mr. Adams's testimony. He declared that "we can intelligently spend the original $17,000,000 appropriation." Mr. Adams told the subcommittee "We have reached the point in this field of medical research . . . where all of us are going to be seriously embarrassed unless there is complete cooperation and better method of planning. There are simply not enough men or facilities. We have reached the point at which we now begin to compete for the services of individuals and institutions." Senator Knowland of California, subcommittee, said the NCI funds are cut to $12,000,000 for 1948 research for reasons besides Adams's testimony.

Arlington Offers Name for New Veterans' Hospital

County of Arlington officials have proposed the name "MacDonald General Hospital" for the new multimillion dollar Veterans Administration Hospital to be erected on the Nevius Tract, across the Potomac River from the Lincoln Memorial. The name honors the late Lawrence R. MacDonald, Arlington resident killed in the Battle of the Bulge, who as a boy had explored every corner of the vast tract. His parents live on Fort Myer Drive on a bluff overlooking the hospital site.

Increase in Venereal Diseases Reported

A sharp increase in venereal disease in the nation's capital was predicted by local health officials for the present year. An alarming number of the cases involve young people, one half of all venereal infections occurring in girls under 22 and boys under 25. "Medical science alone cannot stamp out venereal disease; the active support of citizens is necessary," stated Dr. S. Ross Taggart, chief of the venereal disease bureau.

National Clearing House on Training of Teachers for Deaf at Gallaudet

Formation of a national clearing house on information about training of teachers for the deaf was announced at the installation of Dr. Leonard M. Elstad as the third president of Gallaudet College in Washington, world's only college for the deaf. Sixty school administrators attended the conference at the college, where the information bureau will be conducted. Only 47 persons are being trained now in the United States for deaf teaching. A decade ago about 150 were trained annually. Also discussed was the problem of providing high school educations for the 17,000 deaf children now enrolled in all types of schools.

Atomic By-Products Expected to Aid Medical Research

Medical research is expected to benefit from decisions of the Atomic Energy Commission to make available to science two by-products of atomic energy plants, heavy water and deuterium gas. The by-products have been described by scientists as the "seven league boots of science." They will be made available in sufficient quantities to supply qualified research institutions. Heavy water contains twice the weight of hydrogen in ordinary water and is valuable for its content of the heavy isotope of hydrogen called deuterium. Introduced into a live animal body, including man, isotopes can be traced to provide new clues to body processes.

Government Policy on Scientific Researches in Conflict

There is seeming conflict in the War Department's plans for scientific personnel. When Gen. Henry S. Aurand disclosed that the department was preparing to create an élite corps of officer scientists it was disclosed that the department has launched a program of firing and demoting civilian scientists. It is reported that the department's scientific manpower branch is about to be scuttled at a time when America is said to be lagging behind other countries in scientific research and development and national security is threatened.

Lilienthal Advocates Joint Major Effort to Develop Atomic Energy

David E. Lilienthal, chairman of the Atomic Energy Commission, informed the American Society of Newspaper Editors that a major effort will be required in the United States, carried on jointly by American science, industry, the armed forces and the government, to create a strong atomic energy industry. He declared that the nation had lost some of its leadership in atomic energy in recent months.

Senate Committee Votes Million Dollars for Streptomycin Research

One million dollars out of the $9,626,000 voted for the National Institute of Health at Bethesda, Md., by the Senate Appropriations Committee was earmarked for research in treating tuberculosis with streptomycin. The committee also voted a $4,500,000 fund to combat mental illness, a half million dollars more than the House had approved. The money was included in the $1,676,198,080 labor-federal security appropriation bill.

Automobile Association Suggests Health Check on Communities to Be Visited

The American Automobile Association has warned tourists, especially those with children, to check on the health status of places they plan to visit. This warning was issued because of the smallpox scare in New York and scattered outbreaks of influenza elsewhere.

Residents Urged to Be Vaccinated Against Smallpox

Following the spread of smallpox in New York City and Upper New York State, officials of the District of Columbia warned all citizens who have not been vaccinated against the disease in the last five years to undergo vaccination immediately.

Medical Legislation

MEDICAL BILLS IN CONGRESS

Taft-Smith-Ball-Donnell Bill

Hearings on S. 545, the **Taft-Smith-Ball-Donnell bill** to enact a National Health Act, have been scheduled to commence on May 21 *and will probably continue for about four weeks.*

Army and Navy Medical Department

Companion bills have been introduced to provide for the **procurement of physicians and surgeons** in the Medical Department of the Army, S. 1143, introduced by Senator Gurney, South Dakota, and H. R 3174, introduced by Representative Andrews, New York. This legislation would increase the active duty base and longevity pay of each commissioned *officer of the Medical Corps with less than thirty years'* active federal commissioned service by $1,200 a year It would authorize the designation as specialist of qualified commissioned officers of the Medical Corps, who in addition to the pay and allowances otherwise provided by law would receive an increase of 25 per cent of base and longevity pay while on active duty. It would establish in the Medical Department of the Regular Army four professorships in medicine, surgery, neuropsychiatry and preventive medicine, and physicians so designated will have the grade, by assimilation, of brigadier general or major general It would authorize the appointment in the Medical Corps of the Regular Army of physicians and surgeons who have been certified as specialists by an American specialty board. Such persons *would be appointed in a grade not above that of* colonel. It would authorize the Secretary of War to employ civilian physicians in such numbers and for such period of time as he may deem necessary to serve in the Medical Department of the Army, and physicians so employed would receive compensation from $3,640 to $9,800 a year, depending on the grade to which appointed Any physician so appointed could be designated as a medical or surgical specialist and receive in addition to his base pay an allowance equal to 25 per cent of such pay. It would authorize the employment by the Secretary of War of physicians on a temporary, full time, part time or fee basis.

Another bill, H. R. 3215, introduced by Representative Andrews, New York, *proposes to revise the Medical Department of the Army* and Navy by establishing in each a Medical Service Corps, consisting of a Pharmacy, Supply and Administration Section, the Medical Allied Sciences Section and the Optometry Section and such other sections as may be deemed necessary by the Secretary of War or Secretary of the Navy, respectively.

Cash Sickness Benefits

Several *bills have been introduced proposing to amend the* Railroad Retirement and Unemployment Insurance Acts to eliminate the provisions in them relating to cash ***sickness and maternity benefits*** which were added by the Crosser Act enacted by the 79th Congress, S. 994, introduced by Senator Hawkes, New Jersey, H. R. 2310 and H. R 2854, introduced by Representative Howell, Illinois, H. R. 2853, introduced by Representative Gillette, Pennsylvania, and H R 2911, introduced by Representative Leonard W. Hall, New York

National Cancer Research Commission

Senator Taft, Ohio, for *himself and* Senator Smith, New Jersey, has introduced S. 1130, a bill to create a **National Cancer Research Commission** in order to provide for and coordinate research in a supreme endeavor to discover the cause or causes of cancer and the means for its prevention, to develop a limited number of research centers and *to mobilize* in the United States a number of the world's outstanding experts in scientific research to utilize their services. An appropriation of $5,000,000 *would be authorized* for the first year. This appropriation would be increased by $5,000 for each of the succeeding four fiscal years. A similar bill has been introduced in the House, H. R. 3257, by Representative Wolverton, New Jersey.

Miscellaneous

S. J. Res. 95, introduced by Senator Gurney, South Dakota, for himself and Senator Hickenlooper, Iowa, would recognize uncompensated services rendered the nation under the Selective Training and Service Act of 1940, including the services rendered by **examining physicians and dentists.**

Representative Miller, Connecticut, by H. R 3128, proposes to amend the Federal Food, Drug and Cosmetic Act by providing for the **siezure of foods, drugs, devices and cosmetics** that become adulterated or misbranded while held for sale after interstate shipment.

H. R 3046, introduced, by request, *by Representative* Michener, Michigan, provides for the detention, care and treatment of **persons of unsound mind** in certain federal reservations in *Virginia and Maryland.*

Representative Klein, New York, proposes by H. R. 3059 to authorize the President to mobilize in the United States an adequate number of *the* ***world's outstanding experts*** *and coordinate* and utilize their services in a supreme endeavor to discover a new means *of treating,* curing and preventing diseases of the heart and *arteries. An appropriation of* $100,000,000 will be authorized.

STATE LEGISLATION

California

Bill Introduced.—S. 1059, to amend the business and professions code, proposes to make it a misdemeanor for any person to use **x-rays, radium salts** and their derivatives for the *purposes of diagnosis* or *treatment* of any condition of any human being or to sever or penetrate any of *the tissues of any human being unless* the person possesses an unrevoked certificate as a physician and surgeon. These provisions, however, would *not apply to* nurses, *anesthetists* or physicians' office assistants when acting under the direct supervision *of* a physician and surgeon holding an unrevoked and unsuspended certificate or to persons holding licenses issued by the Board of Dental *Examiners or their assistants* or to persons holding valid certificates as a chiropodist when such chiropodist is *administering a local* anesthetic to the tissues of the foot or to persons licensed as a clinical laboratory technologist.

Bill Passed.—S. 1068, which passed the senate April 22, proposes to prohibit *any person other than a physician and surgeon from making* a **postmortem examination** or performing an autopsy.

Colorado

Bill Enacted.—H. 895, which was approved April 14, appoints the *Colorado State Department of Public Health as the sole agency for* carrying out the purpose of the **federal hospital construction act** and requires *the governor to appoint a state advisory hospital council.*

Connecticut

Bills Introduced.—*H. 33 proposes that persons must present* a certificate signed by a physician licensed to practice medicine or surgery in Connecticut before being admitted as a patient in a **state mental hospital** but provides that such examination shall be by a physician of the patient's own choosing. H. 551, to amend the law relating to the state **board of healing arts,** proposes to amend the exemption section so as to provide that persons will not be exempt if they have been refused a *certificate by the state board of healing arts because of failure to pass* the examination provided for or because of failure to satisfy the state board of healing arts as to any other provision of the section. H. 922 proposes to suspend the operation of the provisions of the **naturopathic practice act** relating to licensure without examination until the adjournment of the 1947 session of the general assembly. H. 1375 proposes the creation of a division of **professional and vocational licensing** to include, *among others, the state board of healing arts, the medical examining* board, the board of osteopathic registration, the board of chiropractic examiners and the board of naturopathic examiners.

Bill Enacted.—S. 64, which has become Public Act No. 7 of the Acts of 1947, adds **thyroid** to the list of drugs which may be sold only on a written prescription signed by a member of the medical, dental or veterinary profession licensed by law to administer such drug.

Florida

Bills Introduced.—H. 253 and S. 176 propose to authorize persons to donate and **give their eyes** *for eyesight restoration purposes by last* will and testament and authorizes any state, county, district or other public hospital to purchase and provide the necessary facilities and equipment to establish and maintain an eye bank for restoration of sight purposes. H. 257 proposes a law for the licensing, inspecting and regulating of hospitals and the creation of an **advisory hospital council.** H. 258 and S. 204 propose the creation and establishment of a University *of Florida* ***School of Medicine and Dentistry*** *in Dade County, Florida.* H. 278 proposes, among other things, to authorize the court in a suit in which the **mental or physical condition** of a party is in controversy to order the party to submit to a physical or mental examination by a physician and provides for the giving of a detailed report of such examination to the person examined. H. 283 proposes to authorize the granting of a **divorce** when one of the marital partners has been continuously confined in an asylum, hospital, sanatorium, or other institution for the insane and shall have been adjudicated insane, for a period of seven years. S. 93 proposes that it be declared to be against public policy for any person, firm or corporation diagnosing or prescribing **lenses for the eyes** of any patient to receive *any rebate from* the manufacturer, processor or fitter who filled such prescription. S. 166 *proposes to authorize the state board of health to conduct research* relating to the causes, prevalence, prevention and treatment of **diabetes** *and to purchase and distribute insulin for the treatment of such* disease. S. 193 proposes to require physicians in reporting births to state on the back of the certificate of birth **any deformity or physical defect** existing at the time of birth. S. 245 proposes to authorize the superintendent of the Florida State Hospital, when unable to obtain necessary medical personnel from within the state, to employ competent, **experienced medical personnel** from outside the state of Florida and proposes further that personnel so employed shall be exempt from existing requirements of law as to time of residence in the state and also as to requirements relating to the passing of an examination in the basic sciences.

Maine

Bill Introduced.—S. 529 proposes to require annual **examinations for tuberculosis** of all superintendents of schools, supervisors, *teachers,* school nurses, janitors, school bus drivers and persons employed in the preparation of school lunches.

Bill Passed.—S. 449, which passed the senate April 22, proposes to authorize the governor *to appoint an* ***advisory hospital council*** *to* advise and consult with the department of health and welfare in carrying out the administration of the existing hospital survey act.

Bill Enacted.—H. 1257, which has become chapter 181 of the Public Laws of 1947, provides that no person acting under authority of a state humane agent shall sell, **breed or trade animals** coming into his possession by reason of his office or provide or supply dealers, commercial kennels or laboratories with such animals.

Maryland

Bill Enacted.—H. 173, which has become chapter 335 of the Laws of 1947, **exempts from taxation** buildings, equipment and furniture of hospitals, asylums, charitable or benevolent institutions, no part of the net income of which inures to the benefit of any private shareholder or individual, and the ground, not exceeding 100 acres in area appurtenant thereto and necessary for the respective uses thereof.

Massachusetts

Bills Introduced.—H. 330 proposes the establishment at or near the city of Boston of a university to be known as the **University of Massachusetts** to consist of, among other things, a college of medicine. S. 557 proposes the appointment of a **state house physician to** render, at the state house, first aid treatment and such other emergency medical service as may be necessary in cases of accidents to, or illness of, officers and employees of the commonwealth employed at the state house, to members of the general court, and to persons visiting the state house.

Michigan

Bills Introduced—H. 404, to amend the basic science act, proposes to eliminate from the board of examiners a **chiropractic member** and to exempt from the terms of the act practitioners of chiropractic. H. 405 proposes the creation of a state board of registration and examination **in naturopathic medicine.** Naturopathy is defined by the proposal as "the art and science of naturopathic medicine as taught by the recognized and accredited schools and colleges teaching the art and science of naturopathy."

Minnesota

Bills Enacted.—H. 882, which has become chapter 335 of the Laws of 1947, prohibits hospital employees of a charitable hospital from encouraging, participating in or causing **any strike or work stoppage** against or directly involving such charitable hospital. According to the latest information received by this Bureau this bill, when passed, also contained an amendment providing that the aforementioned restriction should also apply to all state, university, county and municipal hospitals. S. 996, which has become chapter 240 of the Laws of 1947, provides that no person shall act as a superintendent or **administrative head** of a hospital or sanatorium in the state without first registering with the state board of health in the manner provided by the terms of the act. S. 1392, which has become chapter 569 of the Laws of 1947, provides that any student nurse, medical student or medical intern **who contracts tuberculosis** as a result of direct contact with tuberculous patients during the course of his or her training or internship in a public tax supported hospital may be given care and treatment at the expense of the county in which such public hospital is located.

New Hampshire

Bill Introduced.—H. 448 proposes to require every physician attending **a pregnant woman** for conditions relating to the pregnancy to take or cause to be taken a sample of blood of such woman at the time of the first examination and to submit such sample to an approved laboratory for a standard serologic test for syphilis

New Jersey

Bill Introduced.—A. 470, to amend the law relating to **optometry,** proposes to authorize optometrists to prescribe and fit contact lenses.

Bills Passed.—S. 49 which passed the house April 11, to amend the law relating to the **practice of chiropody,** proposes to redefine chiropody as follows: "the diagnosis of or the holding out of a right or ability to diagnose any ailment of the human foot, or the treatment thereof or the holding out of a right or ability to treat the same by any one or more of the following means: local medical, mechanical, minor surgical, manipulative and physiotherapeutic or the application of external medical or any other of the aforementioned means except minor surgical and local medical to the lower leg and ankle for the treatment of a foot ailment: not including, however, the treatment of tuberculosis, osteomyelitis, malignancies, syphilis, diabetes, tendon transplantations, bone resections, amputations, fractures, dislocations, the treatment of varicose veins by surgery or injection, the administration of anesthetics other than local, the use of radium, the use of x-rays except for diagnosis, or the treatment of congenital deformities by the use of a cutting instrument or electrosurgery. The term 'local medical' hereinbefore mentioned shall be construed to mean the prescription or use of a therapeutic agent or remedy where the action or reaction is intended for a localized area or part." S. 208, which passed the house April 14, proposes to authorize the state department of health to purchase and distribute free, in accordance with rules of said department, **antibiotics** for use in preventing or treating communicable diseases.

New York

Bills Enacted.—A. 1646, which has become chapter 305 of the laws of 1947, extends until July 1, 1948 a prior law authorizing physicians who are public officers or employees to render **emergency medical service** to recipients of public assistance. A. 2712, which has become chapter 766 of the Laws of 1947, amends the workmen's compensation act by providing that no claim for services in connection with x-ray examination, diagnosis or treatment of a workmen's compensation claimant shall be valid or enforceable except by a laboratory or bureau of a voluntary hospital authorized and licensed under subdivision one of the workmen's compensation act or except by a physician duly **authorized** as a **roentgenologist** by the chairman for services performed by such physician or under his immediate supervision. S. 2536, which has become chapter 578 of the Laws of 1947, provides for the creation of a temporary state **commission for hospital survey** and planning purposes and prescribes its powers and duties.

North Carolina

Bills Enacted.—H. R. 703, which was ratified April 5, provides for the appointment of a commission for the special purpose of studying and investigating the administration of the various **examining boards in the state.** H. 623, which was ratified April 5, requires laboratories making **serological tests** to be certified by the North Carolina state board of health H. 744, which was ratified April 5, provides for the licensing and **regulating of hospitals** and the appointment of a state advisory council.

Oklahoma

Bill Passed.—H. 278, which passed the house April 9, proposes to make it a misdemeanor for any person to use **the word "Doctor"** or to hold himself out as qualifying to engage in the practice of any of the healing arts without holding an unrevoked license or certificate issued by the laws of the state authorizing the person to practice the healing art covered by the license.

Pennsylvania

Bills Introduced.—H 893 proposes to authorize judges of the courts of common pleas within the state to **create medical clinics** for the examination of persons charged with the commission of criminal offenses. H. 920 proposes the creation of a **public laboratory** for the purpose of rendering pathologic and toxicologic service to coroners in the state. H. 1090 proposes to authorize every school district of a certain class in the commonwealth to provide medical and dental examinations of **school children** in addition to vaccination of children of indigent parents. H. 1288 proposes the enactment of a permissive **sterilization act** for the sterilization of mental defectives under certain conditions S. 582 proposes to **redefine osteopathic medicine** as meaning "a complete and independent school of medicine and scientific system for the preservation of health and the relief and cure of bodily disorders embracing a distinct etiology prophylaxis and therapeutics applicable to all types and conditions of disease which places the chief emphasis on the anatomical and physiological integrity of the body mechanism as being the most important factor in maintaining the well-being of the human body in health and disease and embraces and includes whatever methods of treatment the needs of patient require" S 594 proposes to place the licensing of **osteopaths** under the jurisdiction of the board of medical education and licensure S. 595 proposes to provide for an **osteopathic member** of the state board of medical education and licensure

Bills Passed.—H 905, which passed the house April 15, to amend the law relating to the practice of **osteopathy,** proposes to extend until June 30, 1948 the requirement of a nine months internship prior to examination. H. 917, which passed the house April 15, to amend the medical practice act, proposes to repeal the 1943 law which reduced for a limited period of time the training period of medical **internship in hospitals.** H. 921, which passed the house April 15, to amend the medical practice act, proposes to repeal the 1943 law authorizing the issuance of **temporary permits to practice** medicine under certain conditions

South Carolina

Bill Introduced.—H. 300 proposes the establishment of ten **annual medical scholarships** of the annual value of $550 each to be given to bona fide residents of the state of South Carolina who agree, after the completion of his medical training, to begin promptly and thereafter engage continuously in the general practice of medicine in a rural community in the state for a period of years equal in number to the years that he has been a beneficiary of such scholarship. H 779, to amend the law relating to the **practice of naturopathy,** proposes to prohibit such practitioners from practicing obstetrics or using biologicals

Bill Passed.—S. 254, which passed the house April 10, was reported as proposing to authorize **osteopathic physicians** licensed in the state to certify birth and death certificates in the same manner as is now prescribed by law for other physicians This action should have included the statement that by house amendment of April 9 there was added to the proposal the following proviso. Provided that the osteopaths shall have passed the examination prescribed by the state board of medical examiners as required of other physicians

South Dakota

Bill Enacted.—H. 50, which was approved March 8, was reported as being a hospital survey and construction act It was also reported that the bill as passed contained an amendment which would require any institution accepting federal funds for construction purposes to agree first that it will not discriminate between practitioners of the various healing arts and that every duly licensed doctor of medicine, **osteopathic physician and chiropractor** shall have the right to and shall be entitled to practice his profession in any hospital which has received federal funds. This was an error. The amendment was omitted from the bill as it was finally enacted

Vermont

Bill Passed.—H. 317, which passed the house April 16, proposes a **licensing law for hospitals,** sanatoriums, rest homes, nursing homes, homes for the reception of children and related institutions.

Bills Enacted.—S 38, which was approved April 16, amends the law relating to the **practice of osteopathy** by designating such practitioners as osteopathic physicians and surgeons, rather than practitioners of osteopathy, and authorizing such practitioners to issue certificates relative to the commitment of insane persons and such reports and certificates should be accepted equally with the reports and certificates of physicians of other schools of medicine. The law in effect, authorizes such physicians to have the same rights with respect to the rendering of medical service under the provisions of public health, welfare and assistance laws and regulations now or hereafter in force as are possessed by the regularly licensed physicians and surgeons in the state. It also requires osteopaths to have preliminary training including one year of internship in a hospital approved by the board S. 45, which was approved April 16, is a **hospital survey and construction act** requiring a survey of existing hospital facilities and the preparation of a program for the construction of additional needed facilities. It also requires the appointment of an advisory hospital council and the acceptance of federal funds for assistance in state survey and construction activities

Wisconsin

Bills Introduced.—S 509 proposes to authorize **cooperative associations** to establish and operate nonprofit plans for sickness care, including hospital care, for members through contracts with physicians, medical societies, hospitals and others The proposal would further provide that any person covered by such plan should be free to choose for sickness care any medical or osteopathic physician licensed in the state who has agreed to participate in the plan and abide by its terms, and no physician or osteopath shall be required to participate exclusively in any such plan. A. 512 proposes the enactment of a statewide system of health insurance.

Bills Passed—A. 56, which passed the house April 9, to amend the **chiropractic practice act**, proposes that no person shall assume the title of *or append to his name the words or letters "D C" or "Doctor of Chiro*practic" to represent and designate him as a chiropractor in the specific branch of treating the sick known as chiropractic unless he shall be licensed to practice chiropractic as specified in the chiropractic act A. 161, which passed the assembly April 11, proposes the appointment of a state **board of examiners in naturopathy** and defines naturopathy as "the prevention, diagnosis and treatment of human injuries, ailments and diseases by *means of any one or more of the material methods or agencies* of healing as taught by approved schools of naturopathy, said methods or agencies including dietetics, phytotherapy, vitamin or mineral or glandular food supplementations, irrigations, inhalations, external applications, physiotherapy and electrotherapy The practice of naturopathy shall exclude the practice of medicine, surgery, obstetrics, osteopathy, chiropractic and the use of drugs The practice of naturopathy shall exclude the treatment of cancer, tuberculosis, gonorrhea, syphilis, diphtheria, scarlet fever, typhoid fever, smallpox and fractures" A. 237, which passed the senate April 25, to amend the law relating to **chiropractic**, proposes to define a chiropractor as a person holding a license issued by the state board of examiners in chiropractic S. 156, which passed the senate April 10 to amend the law relating to the **licensing of osteopaths**, proposes to require applicants for a license to practice osteopathy to have completed at least 12 months' internship in a reputable osteopathic hospital or its equivalent

Coming Medical Meetings

American Medical Association, Atlantic City, June 9-13. Dr. George F. Lull, 535 N. Dearborn St., Chicago 10, Secretary.

Aero Medical Association of the United States, Atlantic City, Ritz-Carlton Hotel, June 4-6. Dr. David S. Brachman, 1016 Dime Bldg, Detroit 26, Secretary.

American Association for the Surgery of Trauma, Atlantic City, Hotel Claridge, June 5 7. Dr Gordon M. Morrison, 520 Commonwealth Ave, Boston 15, Secretary.

American Association for Thoracic Surgery, St Louis, May 28-30. Dr. Richard H. Meade Jr., 55 E. Washington St., Chicago 2, Secretary.

American Association of Genito-Urinary Surgeons, Absecon, N. J., June 4-6. Dr. Charles C. Higgins, 2020 E. 93d St., Cleveland 6, Secretary

American Association of Pathologists and Bacteriologists, Chicago, May 16-17. Dr. Howard T. Karsner, 2085 Adelbert Road, Cleveland 6, Secretary.

American Association of the History of Medicine, Cleveland, May 25-26 Dr. Howard Dittrick, 2020 E. 93d St., Cleveland 6, Secretary.

American Association on Mental Deficiency, St. Paul, Minn, May 28 31. Dr. Neil A. Dayton, Box 51, Mansfield Depot, Conn., Secretary.

American College of Allergists, Atlantic City, Hotel Senator, June 6-8. Dr. Fred W. Wittich, 401 LaSalle Medical Bldg., Minneapolis 2, Secretary.

American College of Chest Physicians, Atlantic City, Ambassador Hotel, June 5 8. Mr. Murray Kornfeld, 500 N. Dearborn St., Chicago 10, Executive Secretary.

American College of Radiology, Atlantic City, Haddon Hall, June 7-8. Mr. Mac F. Cahal, 20 N. Wacker Drive, Chicago 6, Executive Secretary.

American Dermatological Association, Murray Bay, Quebec, Can., June 1-5. Dr. Harry R. Foerster, 208 E. Wisconsin Ave., Milwaukee, Wis., Secretary.

American Diabetes Association, Atlantic City, Chalfonte Haddon Hall, June 7-8. Dr. Cecil Striker, 1019 Provident Bank Bldg., Cincinnati 2, Secretary.

American Geriatrics Society, Atlantic City, Hotel Brighton, June 5 7. Dr. Malford W. Thewlis, 25 Mechanic St., Wakefield, R. I., Secretary.

American Heart Association, Atlantic City, Hotel President, June 6-7. Dr. Howard B. Sprague, 50 W. 50th St., New York, Secretary.

American Medical Women's Association, Atlantic City, June 7-8. Dr. Helen F. Schrack, 216 N. Fifth St., Camden, N. J., Secretary.

American Neisserian Medical Society, Atlantic City, Marlborough-Blenheim Hotel, June 8. Dr. William L. Fleming, 750 Harrison Ave., Boston, Secretary.

American Neurological Association, Atlantic City, Ambassador Hotel, June 16-18. Dr. Walter O. Klingman, 195 Ft. Washington Ave., New York 32, Secretary.

American Ophthalmological Society, Hot Springs, Va., June 5-7. Dr. Walter S. Atkinson, 129 Clinton St., Watertown, N. Y., Secretary.

American Pediatric Society, Stockbridge, Mass., May 13-15. Dr. Henry G. Poncher, 1819 W. Polk St., Chicago 12, Secretary.

American Physiological Society, Chicago, May 18-22. Dr. Maurice Visscher, University of Minnesota, Minneapolis, Secretary.

American Proctologic Society, Atlantic City, June 7-8. Dr. Harry E Bacon, 2031 Locust St, Philadelphia 3, Secretary.

American Psychiatric Association, New York, Hotel Pennsylvania, May 19 23. Dr. Leo H. Bartemeier, General Motors Bldg., Detroit, Secretary.

American Radium Society, Atlantic City, June 8. Dr. Hugh F. Hare, 605 Commonwealth Ave, Boston 15, Secretary.

American Rheumatism Association, Atlantic City, Ritz Carlton Hotel, June 7. Dr. Richard H. Freyberg, 321 E. 42d St., New York 17, Secretary.

American Society for Experimental Pathology, Chicago, May 19-23. Dr. Frieda S. Robschlit-Robbins, 260 Crittenden Bldv., Rochester, N. Y., Secretary.

American Society for Pharmacology and Experimental Therapeutics, Chicago, May 18-22. Dr. Harvey B. Haag, Medical College of Virginia, Richmond 19, Va., Secretary.

American Society for the Study of Sterility, Atlantic City, Hotel Strand, June 7 8. Dr. John O. Haman, 490 Post St., San Francisco 2, Secretary.

American Society of Biological Chemists, Chicago, May 18 22. Dr. Otto A. Bessey, Public Health Research Institute, New York 9, Secretary.

American Society of Clinical Pathologists, Atlantic City, June 4-8. Dr. Alfred S. Giordano, 531 N. Main St., South Bend, Ind., Secretary.

American Society of Electroencephalography, Atlantic City, Marlborough Blenheim Hotel, June 13-14. Dr Robert S. Schwab, Massachusetts General Hospital, Boston 14, Secretary.

American Therapeutic Society, Atlantic City, Chalfonte Hotel, June 6-7. Dr. Oscar B. Hunter, 1835 I St., N. W., Washington 6, D. C., Secretary.

American Urological Association, Buffalo, N. Y., Hotel Statler, June 30-July 3 Dr. Thomas D. Moore, 899 Madison Ave., Memphis 3, Tenn, Secretary.

Association for the Study of Internal Secretions, Atlantic City, June 6 7. Dr. Henry H. Turner, 1200 N Walker St, Oklahoma City 3, Secretary.

Federation of American Societies for Experimental Biology, Chicago, May 18-22. Dr. William H. Chambers, 1300 York Ave., New York 21, Secretary.

Idaho State Medical Association, Sun Valley, June 16-19. Dr. William B. Handford, Caldwell, Secretary.

Illinois State Medical Society, Chicago, Palmer House, May 12-14. Dr. Harold M. Camp, 224 S. Main St., Monmouth, Secretary.

Kansas Medical Society, Topeka, May 12-15. Dr. John M. Porter, 512 New England Bldg., Topeka, Secretary.

Louisiana State Medical Society, New Orleans, May 12-14. Dr. P. T. Talbot, 1430 Tulane Ave., New Orleans 13, Secretary.

Maine Medical Association, York Harbor, Marshall House, June 22 24. Dr Frederick R. Carter, 142 High St., Portland 3, Secretary.

Massachusetts Medical Society, Boston, Hotel Statler, May 20-22. Mr. Robert St. B. Boyd, 8 Fenway, Boston 15, Executive Secretary.

Medical Library Association, Cleveland, Wade Park Manor, May 27-29. Miss Heath Babcock, New York State Medical Library, Albany 1, New York, Secretary.

Minnesota State Medical Association, Duluth, June 30-July 2. Dr. B. B Souster, Lowry Medical Arts Bldg, St. Paul 2, Secretary.

Montana, Medical Association of, Missoula, June 26-28. Dr. H. T. Caraway, 115 N. 28th St., Billings, Secretary.

National Gastroenterological Association, Atlantic City, Hotel Chelsea, June 4-6. Dr. G. Randolph Manning, Room 319, 1819 Broadway, New York, Secretary.

National Tuberculosis Association, San Francisco, June 16-19. Dr. F. D. Hopkins, 1790 Broadway, New York 19, Executive Secretary.

New Hampshire Medical Society, Portsmouth, Hotel Wentworth, June 19-20. Dr. Carleton R Metcalf, 5 South State Street, Concord, Secretary.

North Dakota State Medical Association, Fargo, May 25 27. Dr. L. W. Larson, 221 Fifth St., Bismarck, Secretary.

Oklahoma State Medical Association, Tulsa, Mayo Hotel, May 14-16 Mr. R. H. Graham, 210 Plaza Court Bldg., Oklahoma City, Executive Secretary.

Society of American Bacteriologists, Philadelphia, May 13-16. Dr. Leland W. Parr, 1335 H St. N. W, Washington 5, D. C., Secretary.

South Dakota State Medical Association, Rapid City, May 31-June 3. Dr. Roland G. Mayer, 22½ S. Main St., Aberdeen, Secretary.

West Virginia Medical Association, Charleston, May 12-14. Mr. Charles Lively, 1031 Quarrier St., Charleston 24, Secretary.

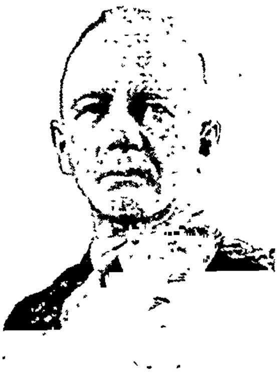
Wyoming State Medical Society, Sheridan, June 23-25. Dr. George E. Baker, 226 E. 2d St., Casper, Secretary.

GOVERNMENT SERVICES

ARMY

THE NEW SURGEON GENERAL AND THE DEPUTY SURGEON GENERAL

President Truman on April 23 sent to the Senate for confirmation the nomination of Brig. Gen. Raymond W. Bliss as Surgeon General of the Army to succeed Major Gen. Norman T. Kirk, whose term expires May 31. Also forwarded to the Senate for confirmation was the nomination for Col. George E. Armstrong, M. C., as deputy Surgeon General with the rank of brigadier general for a four year term. General Bliss, a native of Massachusetts, graduated from Tufts College Medical School in 1910 and was commissioned a first lieutenant in the Medical Reserve Corps the following year and in the Regular Army in 1913 on graduation from the Army Medical School. Later he entered Harvard Medical School for special study in surgery, remaining in Boston for further clinical study and instruction at Harvard until 1921. He has served as chief of surgery at Sternberg General Hospital, Manila, P. I., at Fort Sam Houston and at William Beaumont General Hospital, El Paso, Texas. Early in the recent war he was a military observer in London, then became surgeon of the First Army and Eastern Defense Command in 1942, and the following year was assigned to the Surgeon General's Office as chief of operations and Assistant Surgeon General. He was appointed Deputy Surgeon General in January 1946. During World War II General Bliss made extensive tours of the European, Mediterranean and Pacific areas and was an observer at the atom bomb test at Bikini. He has been awarded the Legion of Merit, the Distinguished Service Medal, the French Legion of Honor and the Award of the Italian Crown.



General Raymond W. Bliss.

General Armstrong, a native of Indiana, graduated from the University of Indiana Medical School, then entered the service as a first lieutenant in the Medical Reserve Corps and was commissioned in the Regular Army in 1926. He graduated as an honor student at the Army Medical School in 1927. On completion of an advanced course at the Medical Field Service School, Carlisle Barracks, Pa., he was engaged for more than a year in the preparation of medical department training manuals. He attended the Command and General Staff School, Fort Leavenworth, Kansas, and then returned to Carlisle Barracks to become director of the Department of Medical Administration. In 1942 he was transferred to Texas to organize a medical department officer candidate school, from which some 8,000 officers graduated before he was ordered to the China-Burma-India Theater to organize a field medical school for Chinese medical officers, later becoming deputy chief surgeon of that theater and chief surgeon of the China theater. On returning to the United States in June 1946 he became chief of the personnel division in the Surgeon General's Office. General Armstrong has been awarded the Legion of Merit, and the Legion of Honor by the Chinese government.

NURSES AND PHYSICAL THERAPISTS NEEDED

With the enactment of Public Law 36, 80th Congress, which grants permanent commissioned status to members of the Army and Navy Nurse Corps and establishes a Women's Medical Specialist Corps in the Regular Army, about 1,800 vacancies exist in the Army Nurse Corps of the Regular Army.

The Women's Medical Specialist Corps will be composed of the Physical Therapists Section, Occupational Therapists Section and Dietitians Section. The law provides for a chief of the Women's Medical Specialist Corps in the temporary grade of colonel and an assistant chief for each section in the temporary grade of lieutenant colonel.

Qualified nurses between the ages of 21 and 35 who served satisfactorily in the military service as Reserve or A. U. S. officers during World War II will be eligible for appointment to the vacancies. Qualified nurses, physical therapists, occupational therapists and dietitians for whom no vacancy is available in the Regular Army will be offered a commission in the Reserve Corps which is created by this legislation. Additional nurses, physical therapists, occupational therapists and dietitians needed over and above the number authorized for the Regular Army to fulfil the needs of the anticipated strength of the interim army will be met by the appointment, with their consent, of qualified Reserve personnel to active duty.

Application blanks for the Army Nurse and Women's Medical Specialist Corps will be available on May 1 at the six army headquarters, all general hospitals within the continental limits of the United States, and on request from the Surgeon General's Office, Washington, D. C. In addition, nurses may obtain application blanks from the counseling and placement service bureaus for state and district nurses' associations and the other groups at their national association headquarters. In overseas areas, application blanks will be available by May 5 through theater and other command headquarters.

THE ARMY AIDS IN TEXAS CITY DISASTER

All facilities of the Army Air Forces in the vicinity of Texas City, Texas, were alerted for relief activities following the recent disaster, and hundreds of military personnel assisted in the rescue and treatment of the injured.

Thirty-six medical officers, eleven nurses and all available medical supplies were flown by ATC from the AAF School of Aviation Medicine at Randolph Field, near San Antonio, to Texas City. The School of Aviation Medicine suspended all normal operations two hours after the blast and made all its facilities available for disaster relief. ATC also flew four plane loads of medical supplies to the stricken city from the St. Louis Medical Depot. Brooke Medical Center at Fort Sam Houston, also near San Antonio, sent medical personnel and supplies by air to open a station hospital for the treatment of the injured at Fort Crockett, which is within the city limits of Galveston, 12 miles south of Texas City.

PACKAGE LIBRARIES FOR HOSPITALS

The Army Institute of Pathology, Washington, D. C., has arranged to lend Veterans Administration hospitals and homes study and review material containing the latest medical information. The material will be used by the Veterans Administration in clinicopathologic conferences, medical meetings and training programs. The institute has agreed to supply this material without the usual deposits and rental fees provided it is used in recognized training programs operated on definite schedules. Available material includes study sets of histopathologic slides, clinical abstracts, lantern slides and atlases. The directive of the Veterans Administration describing this service suggested to hospital managers that "a more comprehensive and instructive teaching and training program will be achieved if field stations utilize this material placed at their disposal by the Army Institute of Pathology."

NAVY

STATEMENT OF REAR ADMIRAL CLIFFORD A. SWANSON, SURGEON GENERAL, U. S. NAVY

The Secretary of the Navy, in his testimony before the Senate Armed Services Committee, has set forth the basic premises on which the Navy supports this bill, of which the following is an excerpt:

At the risk of repetition, I wish to point out again that the agreements of the Secretaries of War and Navy as communicated to the President on January 16, which were approved by him, constitute the basis on which this National Security Act of 1947 is framed. These agreements have as their foundation the integration of effort by coordination, not by consolidation of essential parts of the separate military structures. Other representatives, both of the Navy and of the Army, have voiced the same general sentiment that this bill, which they support, is the worth while tangible result of enlightened understanding, cooperation and honest compromise. Through this same process must be systematically evolved the detailed specifications by which the performance of the functions and responsibilities of the National Defense Establishment are to operate.

In our opinion, this bill (S. 758) as written affords the most workable method, and the necessary machinery, whereby these desirable objectives can be attained. The separate medical requirements of the departments of the National Defense Establishment can be effectively coordinated with one another through employment of the agencies provided for in this bill; at the higher national levels their aggregate requirements in material, facilities and medical personnel could thereby also be coordinated with the essential medical defense needs of the civilian population in accordance with the total medical resources of the country. . . .

We believe this proposed "National Security Act of 1947" represents the long sought for device and method whereby the medical defense needs of the nation—both military and civilian—can all best be correlated.

We therefore subscribe to this bill as written. We endorse its enactment provided modifications are not imposed which would jeopardize the integrity of the Medical Department of the Navy. Such changes would violate the spirit of the basic concept of this bill. They would circumvent the essential elements of the January 16 agreement between the War and Navy departments which has made it possible for the Navy to support the proposed "National Security Act of 1947."

Supplemental Personal Statement by Admiral C. A. Swanson

I have already presented a positive and workable plan for the medical services and for effectively coordinating their activities. I should now like to present my personal comments in opposition to the personal plan presented by the Surgeon General of the Army (THE JOURNAL, May 3, p. 88).

If the plan proposed by General Kirk were so fashioned as to implement the spirit and letter of the "National Security Action of 1947," I would be more in accord with it. However, if my interpretation of its design is correct, it would go far beyond the unification of the medical services of the armed forces as implied in the wording of bill S. 758 and in the proposed executive order to implement some of its provisions. In reality, General Kirk has not proposed a plan for unification of the medical services in the most essential sense. It does not propose the promotion of a concerted endeavor on the part of the Army and Navy Medical Corps toward improvement of their medical services through cooperation and proper coordination. Rather, General Kirk's proposal advocates the substitution for this worthy method, which is already making much progress, a total fusion of the medical services by creation of a single and powerful superorganization. If my interpretation of his proposed plan is correct, I take exception to such a plan. This disagreement is prompted by features in his proposal which I consider to be unworkable or fundamentally defective.

I wish to make it clear that I am in thorough accord with the desirable objectives claimed as merits of the plan presented by General Kirk. However, I do not concur in the method proposed by General Kirk for attaining these ends. I am sure all of us are striving for these same broad objectives, which may be stated in substance as follows:

1. The maximum utilization of the limited number of medical personnel—doctors, dentists, nurses and the other assisting personnel—in order to best carry out the required medical services for the armed forces.
2. The realization of all possible economy in the use of funds, facilities and installations which is compatible with acceptable standards of medical services for the armed forces.
3. The balancing of the essential military needs with those of the civilian population in consonance with the total medical resources of the country.

General Kirk's plan appears to me to be inherently faulty. I should like to invite attention to some points which I believe worthy of careful deliberation:

You have doubtless observed that his proposed plan violates basic and fundamental military principles in that it largely divorces from the major military forces the direction and control of important elements of the medical support which are required by them. The proposed Director General, and the proposed single Armed Forces Medical Service under him, would be directly under the Secretary of National Defense. The Director General of the Medical Services would therefore be on a level comparable with that of the Secretaries of the Army, Navy and Air Force. The functions, facilities, activities and operation of the Armed Forces Medical Service would conceivably even be independent of the Joint Chiefs of Staff, not to mention the respective department secretaries and the chief military heads of the three branches of the armed forces. General Kirk has already stated to this committee that his plan would not work unless there is unification of all the military services at the top. I will go further than that in maintaining that it would not work even passably well without a complete all-out merger of the Army, Navy and Air Force from top to bottom. This latter action will only be feasible when there is no longer any need for separate branches of the armed forces which can be identifiable as an Army, Navy and Air Force.

General Kirk has presented only a brief general outline of his concept of a theoretical plan. He has not revealed any details as to how he conceives it would function operationally in actual practice. To me the conviction is inescapable that a state of lasting confusion and conflicts would ensue under General Kirk's plan. This would be the inevitable result of the crossing lines of authority and the overlapping spheres of responsibility and interests as between the Armed Forces Medical Service and the military departments of the national defense establishment.

In my opinion General Kirk's plan also contains potential dangers in respect to the medical services themselves. While his plan may appear very plausible to some as a panacea for the ills and shortcomings of the medical services of the armed forces, the proposed cure, if adopted, might prove to be worse than the disease. Among the probably undesirable effects in the medical services if General Kirk's plan were adopted would be the following implications:

(*a*) The generation of dissension among the medical personnel. That portion of the medical personnel constituting the Armed Forces Medical Service, who would function directly under the Director General, would be charged with the operation of all general, convalescent and station hospitals (all fixed hospitalization facilities) and with several other important functions as set forth in General Kirk's plan. It is only logical to assume that these medical personnel of the Armed Forces Medical Service would very soon come to be considered as a select and superior group. Conversely, the medical personnel who would be assigned and attached to each of the three major force's internal or organic medical organizations to perform equally necessary but less glamorous functions would tend to feel that they were being openly stigmatized as being inferior. Such potentialities are not conducive of good morale in any organization.

(*b*) The preceding problem would be further aggravated and would be more likely to apply to a greater degree in the case of the medical personnel attached to the Navy and the Air Force, since under the proposed plan no hospitals of any kind would be assigned for operation by them, while the comparable internal medical organization of the Army would operate field and evacuation hospitals. Incidentally, no provision is made in General Kirk's plan for such of these hospitals as are required for the Marine Corps, unless it is to be assumed that army medical units of these types are to be assigned for operation as a part of the Marine Corps organization.

(*c*) The scope and degree of consolidation of the medical services of the armed forces proposed in General Kirk's plan would so emasculate the offices of the Surgeons General as to leave them with little more authority than is now exercised by their respective personnel officers. It would so curtail their functions and so decimate the means which would be available to them as perforce to render the medical services of the major arms incapable of effectively discharging their appropriate responsibilities.

(*d*) Service as a career in the Navy, in the Army and in the Air Force are ways of life distinctly individual and different. That intangible and immeasurable but very real factor sometimes referred to as *esprit de corps* is sometimes spoken of as something inconsequential or undesirable. I believe that such a concept is fallacious. I believe it to be an attribute which cannot be blithely waved aside as something which should be purged from the armed forces.

(*e*) Worth while and fully competent medical organizations which are required as integral operational parts of the separate branches of the armed forces could not long be maintained or provided under a system such as General Kirk proposed. The backbone and sustaining substance of the medical organizations within the major military departments would have been extracted and taken over at a higher level by the supermedical organization. The internal medical departments of the armed forces would soon become sluggish and nonresponsive, later to wither and die. Thus would the body of the Medical Corps of the Navy be destroyed.

(*f*) While it may be claimed that under General Kirk's plan the identity of the Navy Medical Department will not be destroyed, I insist that its integrity and therefore its effectiveness of performance would be seriously affected. Its identity would be preserved largely in name only. I cannot see how, under such a system, a Medical Department of the Navy or of the Army in either their Regular or Reserve components would long endure.

Under General Kirk's plan I see no common meeting ground provided for as an established point of mutually helpful direct contact between the military medical services and the civilian medical world. I believe that this void has already existed too long and that the gap should be bridged. I am opposed to any type of military control over civilian medicine. I am not in favor of prescribing a military pattern to be followed by civilian medicine in the discharge of its responsibilities to the civil population. I do, however, firmly believe that there should be even now a functioning mechanism predominantly civilian in composition at the national level to give guidance and assistance in the development of specific plans for ready use in order that civilian medicine throughout the country can best be prepared to assist in meeting the possible medical defense needs of the civil population in time of acute national emergency. In such an unfortunate event it would be far beyond the capabilities of the medical services of the armed forces, however large at the time, to alone take care of all the civilian and military casualties which might occur. Other medical problems involved may well be equally staggering. I believe that civilian medical leaders in the survey of their problems in this era of ultramodern instruments of war and in the formulation of their plans in connection with these problems would welcome as much advice and assistance as could be afforded them by the military medical services. Our plan, as previously presented, provides for this by means of the joint civilian military medical component in the National Security Resources Board.

The creation of such a powerful medical empire as the Armed Forces Medical Service and its Director General as proposed by the Surgeon General of the Army has this added possible undesirable implication which I am sure General Kirk has never had in mind but which I believe should not be totally overlooked. It seems to me that such a system could well be the first step which might be used at some future date in bringing about regimentation of all the medical activities of the country under one directing head. In fact it might be asked why, if we are to have amalgamation of the medical services of the Army, Navy and Air Force to the proposed degree, should there not also be fused with them under the Secretary of National Defense the United States Public Health Service and the medical service of the Veterans Administration? Some would then wonder why all of civilian medicine should not be brought under this same pattern to constitute a colossal quasi-military medical agency of the federal government to take care of all the medical needs of the entire country.

After careful consideration over a period of several months of proposals and ideas quite similar to General Kirk's plan, I have come to the conclusion that the best method of accomplishing the three desirable broad objectives which I enumerated earlier is by the plan which I outlined within the framework of the bill under consideration by this committee, S. 758. General Kirk's plan does not reveal how any greater overall economies in any category would be effected by it than would result from the plan which we have proposed in consonance with our concept of the spirit and letter of S. 758.

We believe that the Navy plan for coordinating the medical services will effectively bring about the realization of all worth while and practicable economies in the utilization of medical personnel, facilities and money. We believe it will provide the best possible medical service for the armed forces where it is needed and when it is needed. We believe it will foster the highest degree of morale in all the medical services. We believe our plan more fully recognizes the productive principles of copartnership and teamwork which are representative of our American philosophy. Finally, we believe that continued progress toward the mutually desired goals can best be insured through cultivating the wholehearted spirit to pull together and to work as a coordinate team as envisaged by us under S. 758.

THE NEW CIVILIAN NAVAL RESERVE

The Naval Reserve now needs men who are and want to remain civilians but who also want to keep in touch with the Navy and to take advantage of the educational opportunities under the Naval Reserve Program. Among the courses offered are those concerned with hospital technician, laboratory work and pharmacy. The Naval Reserve Training Centers in many localities provide training in almost every phase of the Navy. Time spent in the Reserve is counted for longevity, so that for each three years there is an increase of 5 per cent in base pay. For ex-Navy men of World War II who join the Naval Reserve there is the advantage of protection of rate, for they are enrolled at the rate they held on discharge. This advantage is also extended, in almost all army rates they held, in the corresponding navy rate. One hundred and sixty members of the Naval Reserve in the 17 to 20 age group may be eligible for presidential appointment to the U. S. Naval Academy each year. The status of any veteran under the G. I. Bill of Rights is not changed on his becoming a member of the Naval Reserve

Insigne of the Naval Reserve.

FRENCH PROFESSOR ADDRESSES MILITARY OFFICERS

The eighth in a series of lectures sponsored by the Naval Medical School at Bethesda, Md., was delivered April 17 by Dr. Georges Portmann, professor of otorhinolaryngology, University of Bordeaux, France, on "Surgical Treatment of Carcinoma of the Pharynx, Larynx and Base of the Tongue." Officers of the Army, Navy, Public Health Service and Veterans Administration and civilian doctors of the District of Columbia and Montgomery County are invited to these lectures, after which refreshments are served.

VETERANS ADMINISTRATION

103,000 PATIENTS

More than 49,000 veterans of World War II were among the 103,000 patients under the care of the Veterans Administration on February 1. The remaining 54,000 were veterans of World War I and other wars, members of the armed forces who have been retired from active duty and members of the peacetime military establishment.

Of the World War II veterans in hospitals 22,000 were hospitalized for service connected disabilities and 27,000 for non-service connected disabilities. Of the other 54,000 hospitalized veterans, 12,600 had service connected ailments and the remaining 41,400 non-service connected ailments.

INCREASE IN HOSPITAL BEDS FOR VETERANS

The Veterans Administration announced on March 31 that the number of beds available for the treatment of disabled and sick veterans has increased 27 per cent since VJ day and that during this period the number of veterans' hospitals has increased 29 per cent. The number of veterans' hospitals on March 1 was 126 and the number of beds available 100,541. One new hospital at Tomah, Wis., was completed in March. However, during the period from VJ day to March 31 the applications from veterans for hospital and domiciliary care increased 126 per cent. The increase in the total number of hospitals and beds resulted largely from the acquisition of military hospitals, of which to date 34 have been acquired, 28 of them on a temporary basis pending completion of the Veterans Administration's permanent hospital construction program.

DEPUTY DIRECTOR OF NURSING

Matilda E. Dykstra, New York, has been appointed deputy director of the Veterans Administration nursing service, with headquarters in Washington, D. C. Miss Dykstra, a native of Rhode Island, attended the Rhode Island State College, the Rhode Island Hospital School of Nursing and Teachers College of Columbia University. She has held nursing positions in the Butler and Rhode Island hospitals, Providence, and during the war was chief nurse at the 48th evacuation hospital in the China-Burma-India theater. She has served as a member of the Rhode Island State Board of Nurse Examiners and also as president of the Rhode Island League of Nursing Education.

VETERANS ON THE WAITING LIST

Applications from veterans for hospital or domiciliary care dropped to 73,600 in February after reaching an all time high of 81,700 in January, which were 9,000 more than in August 1946, the previous record month. Notwithstanding the large number of applications, the number of veterans awaiting admission has remained about the same during recent months. At the end of February 23,000 were on the waiting list, compared with 22,000 in January, 22,000 in December and 24,000 in November. Almost all on the waiting list were veterans with non-service connected disabilities. Veterans with service connected ailments have top priority for hospitalization. Veterans with non-service connected disabilities are provided medical care if beds are available and if they say they cannot afford to pay for treatment elsewhere. However, all emergency non-service connected cases are taken care of promptly. Veterans Administration hospitals continued to operate at an occupancy level of 90 per cent, which is about 5 per cent higher than the acceptable normal level for hospitals generally.

BOWLING TOURNAMENT FOR PARALYZED VETERANS

Veterans Administration paraplegic centers are staging a nationwide tenpin tournament by veterans paralyzed from the waist down, bowling from wheel chairs. The five man teams represent each of the five competing hospitals where paraplegics are treated. The contestants were selected by the hospitals in competitive tryouts, each representing the hospital in which he is a patient under treatment for paralyzed legs. The tournament will continue four weeks through May 16 and each player will bowl a total of twelve games. The central office in Washington, D. C., is supervising the tournament. The first, second and third team winners will be presented with trophies donated by the Bowler's Victory Legion of Washington.

MISCELLANEOUS

SALE OF SURPLUS GOVERNMENT PROPERTY

The War Assets Administration is conducting sales of surplus government property announced by the following regional offices. Physicians who are veterans have certain priorities in the purchase of this government property.

Regional Office, 155 West Washington Boulevard, Los Angeles 15. Sale of instrument cabinets, forceps, splints, tourniquets, anesthesia apparatus, folding hospital cots, operating lamps, centrifuges, nurses' desks, operating tables, orthopedic tables, microtome knives. Orders will be filled from certified veterans of World War II for use in their own small business through May 12.

Regional Office, 1955 North 50th Street, Birmingham, Ala. Sale of portable electrocardiograph, instrument sterilizers, cassette changers, cystoscope, refrigerators, office chairs and desks. Sale closes May 26.

District Office, 1201 Pulaski Street, Columbia, S. C. Sale of hospital medical supplies and equipment including fracture tables, electric light bath cabinets, food carts, instrument cabinets, therapeutic lamps, utensil sterilizers, syringe needles, hot water bags, sutures. Inspection dates for priority buyers ends May 13.

Regional Office, 505 North Seventh Street, St. Louis, announces a large sale of surgical instruments and supplies, bandages and first aid dressings, hospital equipment and supplies. Sale closes May 22.

Regional Office, 704 Race Street, Cincinnati. Sale of litters, instrument sterilizers, glass thermometers, neoprene aprons, x-ray dryer and loading bins, water stills, hospital tables. Sale closes May 20.

Regional Office, 1409 Second Avenue, Seattle. Sale of bandages, cotton batting, abdominal packs, flannel bandages. Sale closes May 15.

Regional Office, 600 Washington Street, Boston 11. Sale of hospital supplies. Sale closes May 14.

RESTRICTED SALE OF AMBULANCES

In view of a nationwide need for ambulances, the War Assets Administration has restricted the sale of surplus vehicles of this type to purchasers who certify that the equipment will be used for ambulance purposes only. Under the new policy, ½ ton, ¾ ton and metropolitan type ambulances in condition to be used without repairs will be sold only to purchasers who submit the certification "It is hereby certified that the ambulance requested on this purchase order will be placed in ambulance service by the purchaser and will not be offered for resale." In addition, no sale will be made unless the purchase order contains a certification from the state health department that a need exists in the community for the ambulance service the purchaser expects to render. Such certification will be required of both priority and nonpriority buyers. This instruction makes no change in the priority sequence as established by the Surplus Property Act.

Medical News

(PHYSICIANS WILL CONFER A FAVOR BY SENDING FOR THIS DEPARTMENT ITEMS OF NEWS OF MORE OR LESS GENERAL INTEREST: SUCH AS RELATE TO SOCIETY ACTIVITIES, NEW HOSPITALS, EDUCATION AND PUBLIC HEALTH.)

FLORIDA

Public Relations Director Selected.—The Florida Medical Association has announced the selection of Mr. Ernest R. Gibson as director of the public relations bureau of the association. Mr. Gibson, on completion of a premedical course at Cedarville College, Ohio, in 1928, majoring in bacteriology, was the recipient of a degree of Master of Science from Ohio State University in 1934. He has been engaged in publicity work. The public relations program was authorized by the House of Delegates at its 1946 annual meeting.

ILLINOIS

German Nutrition Survey.—Dr. John B. Youmans, dean of the University of Illinois College of Medicine, Chicago, left April 11 for Berlin, Germany, to serve as nutrition consultant in a survey of the American, British and French occupation zones. The twelve man committee toured cities of the three zones to examine groups of the population and confer with organizations dealing with nutrition.

Surplus Plasma Available.—Surplus army and navy blood plasma has been made available to citizens of Illinois through the cooperation of the American Red Cross and the state health department. The plasma is from blood voluntarily donated through the American Red Cross for use in the armed forces. Any hospital in the state requiring blood plasma need only to make request to the department of public health. Plasma is available free of all cost to the patient except for an administration fee which might be made by physicians and hospitals.

State Survey of Child Health Service.—The Illinois county chapters of the National Foundation for Infantile Paralysis have contributed $21,150 to the cost of a statewide study of child health service now being conducted by the American Academy of Pediatrics. The sum is 70 per cent of the $30,000 which the academy estimates is the cost of the survey, directed by Dr. George S. Frauenberger, Evanston. When completed in two years it will supply data on the extent and nature of existing medical facilities for children in the state and disclose further needs in the field.

Postgraduate Education.—The Illinois State Medical Society held the tenth and last of its postgraduate conferences this year in Monmouth on April 24. Chicago physicians who participated in the program were Robert S. Berghoff, "Coronary Disease"; James H. Hutton, "The Neurotic Patient—The Psychiatrist and the Endocrinologist"; Louis R. Limarzi, "Clinical Interpretation of Sternal Puncture"; Frederick H. Falls, "Early Diagnosis of Cancer"; Harry A. Oberhelman, "Appendicitis in Infancy and Childhood," and Arthur J. Atkinson, "Gastrointestinal Diagnosis."

Building Fund Campaign.—A building fund campaign to raise $1,375,000 for the expansion of St. Francis Hospital, Evanston, is being conducted under the direction of Dr. Irving Perrill, Chicago, general chairman of the campaign organization. The fund will be used to construct an addition to the main building to help relieve the hospital bed shortage in the area. The new addition will include an outpatient department, communicable disease section, laboratory and adjunct facilities, interns' quarters and additional beds. It will have four stories with a ground floor basement, general offices, medical treatment rooms, pediatric rooms, eye, ear, nose and throat department, admitting room offices, pharmacy, staff rooms and private patient and nurses' facilities. Dr. Perrill was chief of the medical staff for two terms and has been associated with the hospital for seventeen years.

Program for Alcoholic Addicts.—At a meeting April 2 Dr. Anton J. Carlson, professor emeritus of the University of Chicago, addressed representatives of various state hospitals on the problem of research and the urgent need for an active program in an attempt to analyze and aid alcoholic addicts. Dr. Andrew C. Ivy, vice president in charge of the professional schools at the University of Illinois, Chicago, discussed various phases of possible research. Dr. George A. Wiltrakis, Chicago, deputy director of the medical and surgical service of the Department of Public Welfare, said there is a total of 1,700 patients, or about 5.3 per cent alcoholic addicts, in the nine state mental hospitals. He appointed a committee to study this problem and initiate studies in research work throughout the state institutions. This committee on research consists of Dr. Harry R. Hoffman, Chicago, the state alienist, chairman; Dr. Ivy; Dr. P. Paul Hletko, chief medical officer of the Department of Public Welfare; Erich Liebert, clinical director of the Elgin State Hospital; Dr. Charles Katz, clinical director of the Kankakee State Hospital; Mrs. M. Platner, chief sociologist in the Department of Public Welfare; Phyllis Wittman, chief psychologist of the Illinois state institutions; Dr. Ben W. Lichtenstein, chief of laboratories at the Illinois Neuropsychiatric Institute, Chicago, and Max K. Horwitt, Ph.D., Elgin, research biologist at the Elgin State Hospital.

Chicago

President of Abbott Laboratories.—Mr. Raymond E. Horn, vice president and director of sales of Abbott Laboratories since 1933, was elected president and general manager of the company at a meeting of directors April 3, succeeding the late Rolly M. Cain.

Northwestern Faculty-Alumni Reunion.—Graduating students and the fifty and fifty-five year classes will be the honor guests at the Faculty-Alumni Reunion of Northwestern University Medical School at a complimentary luncheon in Thorne Hall June 16 from noon to 2 p. m. The five year classes of 1902, 1907, 1912, 1917, 1922, 1927, 1932, 1937 and 1942 are urged to start to make plans for their individual reunions. Reservations should be sent to the Medical Alumni Office, 303 East Chicago Avenue, Chicago 11.

Report of Tuberculosis Institute.—During the last year the Tuberculosis Institute of Chicago and Cook County contributed $37,700 in grants to other agencies fighting tuberculosis from the Christmas Seal funds of the institute. The City of Chicago Municipal Tuberculosis Sanitarium received $21,000 to cover salaries of eight technicians and statistical workers and for the expense of workers and patient students in the sanitarium laboratory; Michael Reese Hospital, $3,000; Chicago Council of Social Agencies, $2,500; George Williams College, $2,800; Provident Hospital, $2,500; Northwestern University Medical School, $1,500; Cook County Health Department, $1,400; Chicago Medical Society, $400 for copies of the Newitt report; Chicago-Cook County Committee for the Eradication of Tuberculosis, $1,000 for office rental and salaries; Chicago Orphan Asylum, $1,500, and the American Trudeau Society, $100 to enable two physicians to take graduate work in thoracic diseases.

IOWA

Brucellosis in Iowa, 1946.—During 1946 reported cases of brucellosis of man in Iowa totaled 638. Of the 96 per cent of all case reports containing information regarding their history, 74 per cent showed direct contact of the patient with hogs and cows before onset of the illness. Of the remaining 26 per cent giving no history of contact with livestock, it is assumed that exposure resulted through unpasteurized dairy products. There were 75 packing house employees, 55 farm wives, 14 veterinarians and their assistants, 16 farm boys, 4 farm girls, 5 who worked in retail meat markets or at locker plants and 11 livestock dealers, truckers, sales barn or dairy workers. The study was made by the U. S. Public Health Service in cooperation with the Iowa State Department of Health.

KANSAS

Annual State Medical Meeting.—The eighty-eighth session of the Kansas Medical Society will meet in the Kansan Hotel, Topeka, May 12-15, under the presidency of Dr. William M. Mills, Topeka. Out of state speakers include:

Dr. Alexander Marble, Boston, Treatment of Diabetic Coma.
Dr. George T. Pack, New York, Extension of Radical Surgery and the Treatment of Carcinoma of the Stomach.
Dr. Hilbert Mark, Minneapolis, Follow-Up Procedure on Cases and Suspected Cases Found in Mass Chest X-Ray Survey.
Dr. Alvin F. Coburn, Chicago, Rheumatic Fever Problem.
Dr. Lester D. O'Dell, Chicago, Blood Loss During Placental Stage.
Dr. George F. Lull, Chicago, Secretary and General Manager of the American Medical Association, Activities of the American Medical Association.
Dr. Henry H. Kessler, Newark, Rehabilitation of the Amputee.
Dr. Thomas H. Burford, St. Louis, Present Status of Heart and Great Vessels Surgery.
Dr. Edward S. Judd Jr., Rochester, Minn., Resection of the Right Colon for Malignant Tumors.
Dr. Marion A. Blankenhorn, Cincinnati, Nutrition and Diseases of the Liver.
Dr. Philip W. Brown, Rochester, Minn., Management of Diverticulosis and Diverticulitis of the Colon.

Round table luncheons will be held each day on a number of subjects with visiting specialists in attendance. The annual banquet will be Wednesday at 7 p. m. in the High School cafeteria. The Woman's Auxiliary will meet May 13-15, registration being held in the Municipal Auditorium. The Kansas Medical Assistants' Society will meet at the Hotel Jayhawk May 11-12 and the Kansas Obstetrical and Gynecological Society on Tuesday at 4:45 in the Municipal Auditorium. Scientific movies will be shown in the Municipal Auditorium Tuesday, Wednesday and Thursday mornings and afternoons. The alumni banquet of the University of Kansas Alumni will be at the Jayhawk Tuesday at 6:30 and the alumni banquet of all other schools will be at the Kansas Hotel.

MAINE

Course in Ophthalmology.—A basic course in ophthalmology will be given at Westbrook Junior College, Portland, Maine, June 20 to September 13 under the auspices of the Ophthalmological Study Council. Among subjects to be covered will be anatomy, pathology, bacteriology, physiologic optics, neuro-ophthalmology, surgical principles, glaucoma and general diseases and ophthalmoscopy. There will be laboratory work in pathology and optics and practical work in slit lamp, perimetry and refraction. Further information may be obtained from the Ophthalmological Study Council, 520 Commonwealth Avenue, Boston.

MASSACHUSETTS

Dr. Gross Receives Matas Medal.—Dr. Robert E. Gross, Boston, has been selected as the next recipient of the Matas Vascular Surgery Medal, named in honor of Dr. Rudolph Matas, famous New Orleans surgeon. Dr. Gross is credited with performing the first successful operation for correction of ductus arteriosus. The award was announced by Dr. Emile Bloch, New Orleans, chairman, Board of Administration of the Tulane Educational Fund.

The Annual Cutter Lecture.—Dr. Thomas M. Rivers, director of the Hospital of the Rockefeller Institute for Medical Research, New York, delivered the annual Cutter Lecture on preventive medicine at Harvard University School of Public Health, Boston, April 22, on public health aspects of infectious disease. The Cutter Lecture is given under the terms of a bequest from Dr. John Clarence Cutter, whose will provided for an annual lecture on preventive medicine to be delivered in Boston, which would be free to the medical profession and the press.

MICHIGAN

Honor Class of 1897.—At the sixth annual Clinic Day of the Wayne University College of Medicine Alumni Association, Detroit, May 14 at the Hotel Statler, life membership in the Alumni Association and "golden anniversary" diplomas will be awarded the sixteen surviving members of the 1897 graduating class of what was then known as the Detroit College of Medicine, parent institution of the Wayne University College of Medicine. Morning and afternoon programs of scientific discussions in the College of Medicine auditorium and a luncheon at St. Mary's Hospital will precede the banquet program.

Academy of General Practice.—The Academy of General Practice of Wayne County was inaugurated February 13. About 100 general practitioners attended the inaugural dinner and business meeting. Guest speakers who have taken an active part in the formulation of the academy include Drs. Henry A. Luce; Thomas K. Gruber, Eloise; Leo G. Christian, Lansing; Patrick I. Ledwidge, president-elect of the Michigan State Medical Society; Warren W. Babcock, secretary of the Wayne County Medical Society; Ralph A. Johnson, editor of the *Detroit Medical News;* Louis J. Gariepy, and William P. Woodworth.

MISSOURI

The Doctors' Medical Foundation.—A group of St. Louis physicians and surgeons has formed the Doctors' Medical Foundation and applied for a pro forma decree under which it will continue nonprofit studies in hospital care and medical administration and initiate research. On the basis of exhaustive surveys the ultimate goal of the foundation is to construct and operate a hospital in accordance with the recommendations resulting from their findings and from national studies. Among other things, the foundation proposes to continue to make studies of the St. Louis area hospital-patient-doctor relationship and to disseminate facts to the community leaders, to offer medical consultative services to hospitals and health centers in surrounding rural areas and to carry on educational activities related to rendering care to the sick and injured and the promotion of health. The foundation has found that with 50 medical specialists for every hundred thousand of population St. Louis is surpassed only by Boston and San Francisco. The proportion of general practitioners was found to be correspondingly high, with 174 physicians and surgeons per hundred thousand of population in St. Louis proper and 87 per hundred thousand within a 50 mile radius of St. Louis. The foundation concludes, on the basis of its surveys, that despite the relatively large number of specialists and general practitioners in the area and the seeming abundance of hospital beds within the city proper, present facilities do not offer all income levels the realization of maximum benefits of professional skill available. The officers of the Doctors' Medical Foundation, 3615 Olive Street, St. Louis, are Dr. Grey Jones, president; Dr. Louis H. Jorstad, vice president, and Dr. Raymond O. Muether, secretary.

NEW JERSEY

Society News.—The Morris County Medical Society and their guests, members of the Summit, Somerset, Sussex and Warren societies, heard Dr. Robert R. Linton of the Massachusetts General Hospital, Boston, April 17, at Bernardsville. Dr. Linton spoke on "Venous Thrombosis and Pulmonary Embolism and the Postthrombotic States."

Death from Smallpox.—The death April 17 of a Trenton man aged 32 visiting in Camden spurred the state's vaccination program begun several days earlier as a precautionary measure in view of the outbreak in New York. All contacts with the case were immediately vaccinated, and the entire Camden population was asked to take the same precautions. According to a newspaper report, health authorities in Camden said April 16 that the smallpox victim had no contact with New York city residents, so far as known.

NEW YORK

Regional Cancer Teaching Day Programs.—Two regional cancer teaching day programs will be held in Johnson City and Forest Hills May 14 and 16 respectively. On the Johnson City program, to be held at the Educational Building of the Charles S. Wilson Memorial Hospital at 2:30 p. m., breast tumors, recognition and treatment of pelvic cancer and clinical results from nitrogen mustard therapy will be discussed; at the evening meeting diagnosis and treatment of cutaneous cancer and precancerous lesions and cancer of the esophagus. The Forest Hills meeting will be held in Queens General Hospital, Jamaica, at 2:30 in the afternoon, at which a new method of teaching cancer will be discussed following a clinical program beginning at 1 o'clock. Other subjects of the afternoon and evening meetings are gastrointestinal cancer, recognition and treatment of pelvic cancer, the role of radiation therapy in the treatment of cancer and allied diseases and recent advances in the treatment of lymphomas and leukemias. Dr. Sture Osterlind, Stockholm, director of cancer research, Swedish National Cancer Institute, will speak on cancer control in Sweden.

Postgraduate Lectures.—The Medical Society of the State of New York, with the cooperation of the New York State Department of Health, has arranged the following postgraduate lectures for the Cayuga County Medical Society at Auburn: May 21, Symposium on Hypertension; June 19, "Preventive Medicine as a Part of General Practice of Medicine" by Dr. Albert D. Kaiser, professor of child hygiene, University of Rochester School of Medicine and Dentistry, Rochester. The Saratoga County Medical Society on May 22 at 4:30 p. m., Newman's Lake House, Saratoga Springs, will hear Dr. J. G. Fred Hiss, professor of clinical medicine, Syracuse University College of Medicine, Syracuse, speak on "Rheumatic Fever—Rheumatic Heart Disease." On May 15, 2 p. m. at the Armitage Tea Room, Seneca Falls, Dr. Ferdinand J. Schoeneck, professor of clinical obstetrics, Syracuse University College of Medicine, Syracuse, will address the Seneca County Medical Society on "Gynecology in General Practice." "Infections of the Genitourinary Tract" will be presented to the Tompkins County Medical Society by Dr. Leo E. Gibson, professor of clinical surgery (urology), Syracuse University College of Medicine, Syracuse, at Tompkins County Memorial Hospital, Ithaca, May 19 at 8:30 p. m.

New York City

Society News.—At the annual meeting of the Brooklyn Urological Society the following officers were elected: Drs. John F. Griffin, president; Frank C. Hamm, vice president, and Lawrence J. Lavalle, secretary, all of Brooklyn.

Smallpox Vaccination.—An estimated 5,265,000 persons in New York City were vaccinated within a three week period during April following New York's smallpox outbreak, which is apparently curbed. Vaccinations, however, are continuing.

Inoculations are being given in city hospital clinics daily except Sundays from 9 a. m. to 5 p. m. and service at the clinics will continue indefinitely. Twelve persons were stricken, two fatally, in the state's first outbreak since 1936.

Professor of Surgery Appointed.—Dr. Frank Glenn has been appointed surgeon in chief at the New York Hospital and the Lewis Atterbury Stimson professor of surgery at Cornell University Medical College, New York, beginning July 1. Dr. Glenn, succeeding Dr. George J. Heuer, who will retire, received his M.D. degree from the Washington University School of Medicine, St. Louis, in 1927, and following internships and residencies at the Peter Bent Brigham Hospital, Boston, was appointed in 1931 by Dr. Harvey Cushing the last of the Gorham Peters Traveling Fellows. His first appointments at the New York Hospital-Cornell Medical Center were in 1932. At present he is an associate attending surgeon at the New York Hospital and associate professor of clinical surgery in Cornell University Medical College. He served in the U. S. Army Medical Corps from 1942 to 1946 and following his return to the United States in 1945 he was surgical consultant to the Sixth Service Command, with headquarters in Chicago.

OKLAHOMA

Annual State Medical Meeting.—The Oklahoma State Medical Association will hold its fifty-fourth annual meeting, May 14-16, at the Mayo Hotel in Tulsa under the presidency of Dr. Louis C. Kuyrkendall, McAlester. Section meetings in medicine and surgery will be held during the mornings of May 14-16 and general sessions in the afternoons of those days. On Thursday evening, May 15, a symposium on Modern Therapy will be presented. Guest speakers will be Drs. James W. Watts, neurosurgeon at Gallinger Municipal and George Washington University hospitals, Washington, D. C.; Nicholson J. Eastman, obstetrician in chief, Johns Hopkins Hospital, Baltimore; Samuel F. Marshall, associate in surgery, Lahey Clinic, Boston; James G. Hughes, associate professor of pediatrics, University of Tennessee College of Medicine, Memphis; Tinsley R. Harrison, professor of internal medicine, and J. Bedford Shelmire, professor of dermatology and syphilology, both of Southwestern Medical College, Dallas, Texas; Francis L. Lederer, professor of otolaryngology, University of Illinois College of Medicine, Chicago; T. Duckett Jones, director of research in rheumatic fever and rheumatic heart disease, House of the Good Samaritan, Boston, and Charles D. Creevy, Minneapolis, former assistant dean of the University of Minnesota Medical School, Minneapolis. A dinner will be given by the Alumni Association of the University of Oklahoma School of Medicine, Oklahoma City, on Wednesday, May 14. The president's inaugural dinner dance will be Friday, both dinners to be held at the Hotel Tulsa. The Woman's Auxiliary will meet May 13-15, with headquarters at the Mayo Hotel.

PENNSYLVANIA

Pennsylvania Leads in Cancer Detection Centers.—Pennsylvania leads all other states in the number of cancer detection centers now in operation, according to the National headquarters of the American Cancer Society. Twelve centers have been set up by county units at the Falk Clinic, Pittsburgh; Mercy and Altoona hospitals, Altoona; Nason Hospital, Roaring Springs; Coaldale State Hospital, Coaldale; Delaware County Hospital, Drexel Hill; Fitsgerald-Mercy Hospital, Darby; Chester Hospital, Chester; St. Vincent's Hospital, Erie; Williamsport Hospital, Williamsport; Washington Hospital, Washington, and Latrobe Hospital, Latrobe. In addition to these there are nine centers in Philadelphia. Funds have been approved for six new detection centers, three in Westmoreland County, two in Delaware and one in Beaver.

Philadelphia

Annual Lectureship. — The Phi Lambda Kappa Annual Lectureship for 1947 will be presented by Dr. Harry Gold, associate professor of pharmacology, Cornell University Medical College, on Tuesday, May 27, in the auditorium of the Hahnemann Medical College on "Management of the Failing Heart." All doctors and students are invited to attend.

University News.—Dr. Alexander J. Steigman will resign from the department of pediatrics of Temple University School of Medicine to serve as senior fellow in pediatrics of the National Research Council. He will work at the Children's Hospital Research Foundation, Cincinnati, with Dr. Albert B. Sabin. A graduate of Temple University, Dr. Steigman has been with the department of pediatrics of the University of Pennsylvania and Harvard Medical School before his current work at Temple.

Pittsburgh

Annual Scientific Session.—The annual meeting of the Allegheny County Medical Society will be held May 21 at Hotel William Penn, Pittsburgh. Dr. Andrew C. Ivy, vice president of the University of Illinois in charge of Chicago professional schools, will open the program, speaking on "Psychological Aspects of Recently Suggested Treatment of Peptic Ulcer." Dr. Henry L. Bockus, University of Pennsylvania, Philadelphia, will discuss "Medical Management of Peptic Ulcer" and Dr. Waltman Walters, Mayo Clinic, Rochester, Minn., will speak on "Resection of the Vagus Nerve in the Treatment of Peptic Ulcer—Favorable and Unfavorable." A social after dinner program has been planned by the committee.

Mercy Hospital Centenary.—On May 10 Mercy Hospital will open a four day program of its centenary celebration, which will include a forum in the Foster Memorial May 13. The hospital began its service to the community Jan. 1, 1847 with a personnel of eight or ten, a patient load averaging 14 and a medical service chiefly medical. It now is a large modern hospital with a personnel of more than 1,000 trained and skilled men and women and a daily occupancy averaging 687; the hospital cares for 15,000 inpatients annually and an equally large number of ambulatory patients. Throughout the century it has cared for more than a million Americans. Besides its care of the sick and the instruction of medical students and nurses, the hospital functions as a research center and a center for the dissemination of preventive medicine.

TENNESSEE

Graduate Course in Pathology.—At the request of local specialists the University of Tennessee College of Medicine, Memphis, recently offered postgraduate courses covering the pathology of the eye, ear, nose and throat and the pathology of the genitourinary tract. Among the lecturers was Col. James E. Ash, M. C., U. S. Army (retired), Washington, D. C., scientific director of the American Registry of Pathology and former director of the Army Institute of Pathology. Each course consisted of a series of lectures followed by the study of selected pathologic specimens.

TEXAS

Personal.—Dr. Owen P. Gandy, Lufkin, has been appointed Angelina County health officer, replacing Dr. Linwood H. Denman, whose term has expired. Dr. Gandy is a graduate of Baylor University College of Medicine, then of Dallas, 1912. He was also appointed to the all medical board of the Angelina County Hospital, Lufkin.——Ardzroony Packchanian, Ph.D., director of the laboratory of microbiology of the University of Texas Medical Branch, Galveston, spent several weeks in April and May as visiting lecturer in tropical medicine at the Universidad de Nuevo Leon School of Medicine, Monterrey, Mexico, where he gave lectures and demonstrations on Chagas' disease, Weil's disease and leishmaniasis.

Foreign Visitors.—Dr. Henri Makower, director, Institute of Microbiology, University of Warsaw, Poland, visited the University of Texas Medical Branch, Galveston, in April to survey studies of Ludwik Anigstein, Ph.D., on the chemotherapy of rickettsial diseases and the investigations of Morris Pollard, D.V.M., on virus diseases. Dr. Makower is visiting American medical centers as a guest of the Rockefeller Foundation.——Dr. Plinio Rodriguez, Butantan Institute, São Paulo, Brazil, spent two weeks in April visiting the University of Texas Medical Branch, Galveston, to acquire new methods of studying rickettsial diseases. Dr. Rodriguez is visiting American research centers under the auspices of the coordinator of inter-American affairs, Washington, D. C.

WEST VIRGINIA

Preparedness Conference on Poliomyelitis.—A statewide preparedness conference on poliomyelitis, sponsored by the National Foundation for Infantile Paralysis in cooperation with the state health department, will be held May 27 at Jackson's Mill. Health workers and representatives from public and private agencies interested in the fight against infantile paralysis will meet county chapter representatives of the foundation in a one day session to consider ways and means of being better prepared to fight poliomyelitis should the disease reach epidemic proportions during the year. At the general session Dr. Newman H. Dyer, state health commissioner, will discuss the function of the state health department in the control of infantile paralysis, and Dr. Kenneth S. Landauer, New York, will speak on "The National Foundation's Program for Epidemic Emergency and Year Round Medical Care." Two panels, "The Problems of the Physician and His Professional Co-Workers in the Care of Poliomyelitis," and another for county chapter personnel, are scheduled for the afternoon. Doctors, nurses and hospital representatives are invited to attend. Requests for room reservations should be addressed to T. Sterling Evans, West Virginia State Representative of the National Foundation, 307 Security Building, Charleston 1, W. Va.

GENERAL

Northwestern Alumni Luncheon.—The alumni of Northwestern University Medical School will meet for luncheon during the Centennial Celebration of the American Medical Association on June 11 at the Chalfonte-Haddon Hall, Atlantic City, at noon. All alumni are invited. Make reservations either through the Medical Alumni office, 303 East Chicago Avenue, Chicago 11, or at the booth reserved for such luncheons and dinners at the convention.

American Epilepsy League.—Mr. William H. Savin, formerly executive director of the Family Service Association, Washington, D. C., has ben appointed national director of the American Epilepsy League, Inc. Just released from the army as lieutenant colonel, Mr. Savin spent three years in military government in Italy. The American Epilepsy League was founded in 1939 as a national nonprofit organization. The league expects to establish state chapters to bring more extensive health service and education to the 600,000 epileptic persons in this country.

Anesthesiologists Appoint Executive Secretary.—Mr. John H. Hunt has been appointed executive secretary of the American Society of Anesthesiologists, Inc. Mr. Hunt received his education at the University of Wisconsin and Northwestern University. During the war he was a major in the A. A. F. and formerly practiced law in Topeka, Kan. The society will soon move its offices from New York to Chicago. Other officers of the organization are Dr. Edward B. Touhy, Rochester, Minn., president; Dr. Curtiss B. Hickox, Philadelphia, secretary; Dr. Moses H. Krakow, New York, treasurer, and Dr. Henry S. Ruth, Philadelphia, editor.

The Lasker Award.—The 1947 Lasker Award of $1,000 for outstanding service in mental hygiene will be presented for the most significant contribution to popular adult education, especially in parent child relationships. A candidate's work must have been accomplished or generally accepted during the past year or two. Presentation of the award will be made at the annual meeting of the National Committee for Mental Hygiene, November 12-13, in New York. Nomination of candidates for 1947 awards should be submitted by September 10 with full supporting data in triplicate to Dr. George S. Stevenson, National Committee for Mental Hygiene, 1790 Broadway, New York 19.

Annual Meeting of Aero Medical Association.—The eighteenth annual meeting of the Aero Medical Association of the United States will be held at the Ritz-Carlton Hotel, Atlantic City, N. J., June 4-6 under the presidency of Rear Admiral John C. Adams (MC), U.S.N., Washington, D C. An informal president's reception will be held Wednesday evening and the annual banquet on Thursday evening. Among the subjects of papers to be presented at the scientific sessions are the aero program in the army air forces, deaths in patients transported by air, study of pilots who have experienced repeated aircraft accidents, the human adrenal cortex in relation to stressful activities, aviation medicine in relation to atomic weapons and the role of the medical sciences in engineering.

International Congress of Pediatrics.—The fifth International Congress of Pediatrics will be held at the Waldorf-Astoria Hotel, New York, July 14-17. The congress will consist of four parts: (*a*) scientific discussions, (*b*) scientific exhibit, (*c*) visits to medical institutions in New York City and (*d*) a postcongress tour to other cities along the Atlantic seaboard, where scientific programs will be presented. At the eight plenary sessions the topics to be discussed are nutrition, tuberculosis, alimentary toxicosis, virus diseases, chemotherapy, congenital heart disease, neonatal mortality and incompatibility of blood. The organization committee is composed of members of the American Academy of Pediatrics, the Section on Pediatrics of the American Medical Association, the American Pediatric Society and the Society for Pediatric Research.

Chinese Students in the United States.—Forty-five of the 125 Chinese doctors, dentists, public health experts and nurses to whom fellowship awards will be made annually are now taking advanced studies at American universities in fourteen states, according to the United Service to China headquarters. Seven others are en route. The fellowship awards were bestowed by the American Bureau for Medical Aid to China as part of a three year program under which six national medical colleges in various parts of China will receive aid designed to elevate their standards of medical education. On their return to China after a year's study they will join faculties of the six medical colleges. China has only about 13,000 qualified doctors for its 450,000,000 population and should have at least 266,000 if the Chinese people are to have anything approximating adequate medical care. The ABMAC during the war years provided medical supplies, helped train many technicians and introduced sulfathiazole, sulfanilamide and penicillin, as well as its first blood plasma.

International Congress for Microbiology.—The fourth International Congress for Microbiology will be held in Copenhagen, Denmark, July 20-26. A meeting of the Permanent International Commission for the Organization of Congresses will take place during the session. Since no languages have been adopted as official for the congress, the choice of language in which papers may be presented is left to the discretion of the author; however, it will be possible to print abstracts and papers only in English, French or German. The presidents of the congress are Sir Alexander Fleming, England, and Dr. J. Tréfouël, France. Among the speakers to take part in the general microbiology session will be Robert E. Buchanan, Ph.D., Ames, Iowa, "Present Status of Bacterial Nomenclature and Taxonomy"; René J. Dubos, Ph.D., Boston, and Dr. Harry S. Eagle, Baltimore, "The Blood Levels Afforded by Penicillins F, G, K and X and Their Therapeutic Significance"; Drs. H. Corwin Hinshaw and William H. Feldman, Rochester, Minn., "Streptomycin in Experimental and Clinical Tuberculosis," and Dr. Joseph E. Moore, Baltimore, "Penicillin in Syphilis," all from the United States. Among the American speakers in the section on viruses and viral diseases are Drs. John R. Paul, New Haven, Conn., "Epidemiology of Poliomyelitis," and A. B. Sabin, Cincinnati, "Poliomyelitis Virus and Flies." Bernard E. Proctor, Ph.D., Melrose, Mass., will lecture on "Food Poisoning" in the section on dairy and food microbiology.

Medical and Surgical Relief Committee.—The quarterly report of the Medical and Surgical Relief Committee, New York, released April 11, shows that the value of total medical contributions (medicines, instruments and equipment) sent to the relief of hospitals, welfare organizations and missions has exceeded a million dollars. Several French and Italian hospitals, unable to get supplies from any other source, were helped by the Medical and Surgical Relief Committee during this three month period. In France enough material was given to establish a small dispensary and maternity ward in Isigny; in the Normandy sector over $4,000 worth of medicines and instruments were given to the French Red Cross and several thousand dollars worth of supplies to aid Spanish refugees in France through the Unitarian Service Committee. Hospitals helped included the Dispensaire St. Come du Mont, Manche; the hospital of St. Lo, Normandy; the Varsovie Hospital, Toulouse, and the Lasa Clinic, Paris. In Italy, among the hospitals which received shipments are the Clinico Ostetrico, Parma; the Institute Provincia per L'assistanza all'Infanzia, Rome; the Casa di Cura di Maternita, Reggio, Calabria; the Ospedalino Meyer Il Pino, Florence; the Ambulatorio Communale, Salerno; the Ospedali Civile di Udine, and sundry hospitals in Rome, Naples and Milan. In addition to these hospitals, supplies were sent to England, Austria, Poland, Finland, Greece, Palestine, Hungary, Norway, the Philippine Islands, Korea, India, Africa, Indo-China, the East Indies, China, Syria and Japan.

CORRECTION

American Gynecological Society.—A correction appeared in The Journal, April 5, page 1025, concerning the first society devoted exclusively to medical specialists. Dr. George W. Kosmak now writes that the American Gynecological Society was formed in 1876 and held its first meeting in May of that year, making it, he says, the oldest special society in the United States.

Marriages

Vincent C. Scoglietti, Pittsburgh, to Miss Matilda M. Augustine of Natrona, Pa., Oct. 22, 1946.

Edward E. Shapiro, Bayonne, N. J., to Miss Bernice Newman of Jersey City Dec. 9, 1946.

Robert J. Stubblefield, Murray, Ky., to Mrs. Carl M. Clarke of Nicholasville February 15.

Charles Neill Scott, Martinsburg, W. Va., to Miss Louise Clayton in Baltimore February 8.

Deaths

Frederick Douglass Stubbs ⊕ Philadelphia; born in Wilmington, Del., March 16, 1906; Harvard Medical School, Boston, 1931; diplomate of the National Board of Medical Examiners; specialist certified by the American Board of Surgery; member of the American College of Chest Physicians, American Trudeau Society, National Tuberculosis Association, Pennsylvania Tuberculosis Society, American Public Health Association and others; member of the board of directors of the Training School for Teachers in Cheyney, Pa.; on the staffs of the Atkinson Memorial Hospital, Coatesville, Pa., Douglass Memorial Hospital, Mercy Hospital and the Philadelphia General Hospital; died February 9, aged 40, of coronary occlusion.

Charles Morton Alfred, Lancaster, Ohio; University College of Medicine, Richmond, 1894; died February 20, aged 81, of coronary occlusion.

Stephen P. Anthony, Chicago; Rush Medical College, Chicago, 1922; member of the American Medical Association; assistant professor of medicine at the University of Illinois College of Medicine; on the staff of the Alexian Brothers' Hospital; died March 2, aged 63, of heart disease.

Clesson Cushman Atherton, Union Grove, Wis.; Jenner Medical College, Chicago, 1905; College of Physicians and Surgeons of Chicago, School of Medicine of the University of Illinois, 1910; member of the American Medical Association; medical superintendent of the Southern Wisconsin Training School and Colony; formerly affiliated with the state hospitals in Elgin, Jacksonville, Lincoln, Peoria, Kankakee and East Moline, all in Illinois; died in Quincy, Ill., February 20, aged 68, of coronary thrombosis.

Swartz Baines ⊕ Tahlequah, Okla; University of Arkansas School of Medicine, Little Rock, 1906; died January 6, aged 79.

Henry Weston Barnum, Los Angeles; Jefferson Medical College of Philadelphia, 1890; died February 1, aged 88, of carcinoma of the prostate.

Charles W. Bausman, Bradford, Ohio; Medical College of Ohio, Cincinnati, 1904; member of the American Medical Association; died February 15, aged 79, of carcinoma.

Roger Martin Bissekumer ⊕ Rockford, Ill.; Loyola University School of Medicine, Chicago, 1918; formerly district superintendent of the state health department; died March 3, aged 53, of cerebral hemorrhage.

James Colby Blackwood, Eureka Springs, Ark.; Memphis (Tenn.) Hospital Medical College, 1892; member of the American Medical Association; died January 17, aged 87, of angina pectoris.

Harold Blauvelt, Wilmington, Del.; Columbia University College of Physicians and Surgeons, New York, 1917; served during World War I; member of the medical staff of the du Pont Company; died February 7, aged 55, of coronary thrombosis.

David J. Boon ⊕ Philadelphia; University of Pennsylvania Department of Medicine, Philadelphia, 1902; physician to the Municipal Court of Philadelphia; on the staffs of the Episcopal Hospital of Philadelphia and the Roxborough Memorial Hospital; died February 11, aged 69, of cerebral thrombosis.

Herbert Arthur Bostock, Norristown, Pa.; Jefferson Medical College of Philadelphia, 1899; member of the American Medical Association; for many years vice president of the board of education; physician for the fire department; on the staff of the Montgomery Hospital, where he died March 5, aged 71, of cancer of the pelvis.

Harry Patrick Bowen, Watertown, Wis.; Milwaukee Medical College, 1910; member of the American Medical Association; councilor of the First District of the Medical Society of Wisconsin; postmaster of Watertown; died February 13, aged 66, of heart disease.

Lucian Loring Brock ⊕ Washington C. H., Ohio; Starling Medical College, Columbus, 1903; past president of the Fayette County Medical Society; died in the Mount Carmel Hospital, Columbus, February 24, aged 67, of cerebral hemorrhage.

Henry Rolf Brown, Washington, D. C.; University of the City of New York Medical Department, 1889; served in France during World War I; for many years affiliated with the Veterans Administration; died in the Mount Alto Hospital February 15, aged 79, of general arteriosclerosis.

Donald Andrew Campbell, Neosho, Mo.; University of Louisville School of Medicine, 1937; member of the American Medical Association; past president of the Newton County Medical Society; county health officer; lieutenant, medical reserve corps, not on active duty; interned at St. Joseph's Hospital in Kansas City, where he died February 14, aged 35, of neurosarcoma.

James L. Carter, Whitesville, Ky.; Memphis (Tenn.) Hospital Medical College, 1898; past president of the Daviess County Medical Society; served as mayor of Whitesville; died February 7, aged 77, of chronic myocarditis.

George C. Chartters, Washington, D. C.; College of Physicians and Surgeons, Memphis, 1909; died Dec. 12, 1946, aged 62.

Heverland Chesbro, Gilroy, Calif.; Homeopathic Hospital College, Cleveland, 1881; served on the city council, as mayor, as president of the telephone company and on the boards of directors of the Gilroy and San Jose branches of the bank of America; died in the Wheeler Hospital January 22, aged 87, of uremia.

Lorenzo Cione, New York; Regia Università di Napoli Facoltà di Medicina e Chirurgia, Italy, 1901; died February 2, aged 71, of arteriosclerotic heart disease.

Daniel Francis Clancy ⊕ Ennis, Mont.; Jefferson Medical College of Philadelphia, 1905; died in St. James Hospital, Butte, February 5, aged 69, of cerebral hemorrhage and hypertension.

Bertha Elizabeth Dornbush-McComb Colwell, Pittsburgh; Woman's Medical College of Pennsylvania, Philadelphia, 1901; died recently, aged 67, of coronary occlusion.

Claude Milton Cook, Danville, Ill.; National Medical University, Chicago, 1909; member of the American Medical Association; city health officer; at one time affiliated with the U. S. Veterans Bureau; died in the Lake View Hospital February 17, aged 62, of congestive heart failure.

Maurice John Couret ⊕ New Orleans; Medical Department of Tulane University of Louisiana, New Orleans, 1896; specialist certified by the American Board of Pathology; at one time on the faculty of his alma mater; member of the American Society of Clinical Pathologists; served as president of the Association of Louisiana Pathologists; for many years on the staff of the Hotel Dieu; served overseas during World War I; died February 4, aged 72, of bronchogenic carcinoma.

William H. Crane, Philadelphia; University of Pennsylvania Department of Medicine, Philadelphia, 1894; died in the Misericordia Hospital February 7, aged 78, of cerebral hemorrhage.

Joseph Francis Crofton, St. Joseph, Mich.; Northwestern University Medical School, Chicago, 1914; served during World War I; formerly city health officer; died February 14, aged 68, of coronary thrombosis.

Edgar D. Cummins, Lincoln, Neb.; Omaha Medical College, 1889; formerly member of the city council and school board in Plattsmouth; at one time Cass County physician; affiliated with St. Elizabeth's Hospital; died February 3, aged 82, of diabetes mellitus and cerebral thrombosis.

Peter Cutrera ⊕ Chicago; Regia Universitá degli Studi di Palmero Facoltá di Medicina e Chirurgia, Italy, 1894; member of the Radiological Society of North America, Inc.; on the staffs of the Columbia Hospital and the Mother Cabrini Hospital, where he died February 27, aged 80, of coronary thrombosis.

Samuel Middleton de Loffre ⊕ Lieutenant Colonel, U. S. Army, retired; University of Pennsylvania Department of Medicine, Philadelphia, 1899; entered the U. S. Army in 1902; rose through the various ranks and on May 15, 1917 promoted to lieutenant colonel; retired on Dec. 20, 1917 for disability in line of duty; returned to active duty from Jan. 26, 1918 to May 15, 1919; died in Fort Jay, N. Y., June 7, 1944, aged 69, of heart disease.

Ernest Melvin Deputy, Dugger, Ind.; Kentucky University Medical Department, Louisville, 1903; member of the American Medical Association; served as president of the state bank and of the library board; on the staff of the Mary Sherman Hospital in Sullivan; died February 10, aged 69, of nephritis.

Selim Hanna Dik, Syracuse, N. Y.; Columbia University College of Physicians and Surgeons, New York, 1909; at various times affiliated with the Mount Sinai Hospital in New York, the Brooklyn Hospital, Meyer Memorial Hospital in Buffalo, J. N. Adam Hospital in Perrysburg, Broadacres Sanatorium in Utica and the Onondaga Sanatorium, where he died Dec. 29, 1946, aged 68, of carcinoma of the pancreas.

Lawerence Hilton Dunham, Scottsbluff, Neb.; Creighton University School of Medicine, Omaha, 1928; member of the American Medical Association; died in Albion, Wyo., March 13, aged 46, in an airplane crash.

Fred J. Edmonds, Evanston, Ill.; Cleveland University of Medicine and Surgery, 1897; died February 24, aged 71, of cerebral hemorrhage and arteriosclerosis.

Albert D. Ferguson, Philadelphia; University of Pennsylvania Department of Medicine, Philadelphia, 1889; member of the American Medical Association; died in the Temple University Hospital recently, aged 80, of arteriosclerosis.

Isaac Edward Gluckman, Newark, N. J.; Long Island College Hospital, Brooklyn, 1905; member of the American Medical Association; served as a member of the internal medicine department, New Jersey-Delaware Recruiting and Induction District; affiliated with the Essex Mountain Sanatorium in Verona, New Jersey Sanatorium for Tuberculous Diseases in Glen Gardner, Newark Beth Israel Hospital and the Deborah Sanitarium in Brown Mills; died February 21, aged 65, of arteriosclerotic heart disease.

Julius Jerome Goldstein, New York; University and Bellevue Hospital Medical College, New York, 1909; member of the American Medical Association; died recently, aged 60.

Edgar Leonard Goodman, Washington, D. C.; George Washington University School of Medicine, Washington, D. C., 1929; specialist certified by the American Board of Ophthalmology; member of the American Academy of Ophthalmology and Otolaryngology and the American Medical Association; assistant clinical professor of ophthalmology at his alma mater; on the staffs of the University, Garfield Memorial, Episcopal Eye, Ear, Nose and Throat and Gallinger hospitals; died February 28, aged 44, of cerebral hemorrhage.

Elbert Goolsby ⊕ Paris, Texas; University of Tennessee Medical Department, Nashville, 1906; past president of the Lamar County Medical Society; served as health officer of Paris; examining physician for Selective Service in Lamar County during World War II; local surgeon for the Texas and Pacific and the Santa Fe railroads; member of the staff of St. Joseph's Hospital for many years; on the board of the Lamar County Hospital; died recently, aged 66, of coronary occlusion.

John Edward Hamner Sr. ⊕ Petersburg, Va.; Medical College of Virginia, Richmond, 1916; served during World War I; chief surgeon for the McKendree (W. Va.) Hospital and for many years physician for the Meadowriver Lumber Company at Rainelle, W. Va.; died in the Medical College of Virginia Hospital, Richmond, February 24, aged 54, following an operation for gastric ulcer.

Elliott Tate Heckart, Topeka, Kan.; Kansas Medical College, Medical Department of Washburn College, Topeka, 1908; member of the American Medical Association; on the staff of St. Francis Hospital; died in February, aged 64, of carcinoma of the liver.

Charles Everett Hills ⊕ Natick, Mass.; Dartmouth Medical School, Hanover, N. H., 1901; on the staff of the Leonard Morse Hospital; trustee, Natick Five Cents Savings Bank; died February 23, aged 77, of coronary occlusion.

George Hunter ⊕ Oklahoma City; Louisville (Ky.) Medical College, 1904; served overseas during World War I; formerly city and county health officer; died in the Oklahoma City General Hospital February 8, aged 65, of tuberculosis.

Irving R. Johnson, Buffalo; University of Buffalo School of Medicine, 1898; died in the Deaconess Hospital February 28, aged 72, of duodenal ulcer.

Washington Randolph Kidwell, Pueblo, Colo.; Missouri Medical College, St. Louis, 1890; served as city and county physician; died in the Parkview Hospital February 24, aged 80, of diverticulosis of the esophagus.

Henry Pender Ledford ⊕ Wichita Falls, Texas; Lincoln Memorial University Medical Department, Knoxville, 1916; member of the American Academy of Pediatrics; past president of the Texas Pediatric Society; member of the school board; cited for bravery and meritorious service during World War I; died in the Wichita General Hospital February 21, aged 58, of coronary thrombosis.

Frederick William Lester ⊕ Seneca Falls, N. Y.; College of Physicians and Surgeons, medical department of Columbia College, New York, 1894; fellow of the American College of Surgeons; secretary and past president of the Seneca County Medical Society; past president of the Seventh District of the Medical Society of the State of New York; served during World War I; lieutenant colonel, medical reserve corps, not on active duty; died in the Clifton Springs (N. Y.) Sanitarium February 25, aged 76, of coronary thrombosis.

Thomas D'Arcy Lucus ⊕ New York; University and Bellevue Hospital Medical College, New York, 1904; died in the Doctors Hospital February 18, aged 72, of coronary thrombosis and cerebral embolism.

Thomas P. Lynam, Chicago; Rush Medical College, Chicago, 1900; served on the staffs of the Garfield Park and St. Anne's hospitals; died January 11, aged 79.

Miles Ambrose McGrane, Troy, N. Y.; Albany Medical College, 1903; member of the American Medical Association; served on the staffs of the Leonard and Samaritan hospitals; died February 11, aged 69, of cerebral hemorrhage.

Burt Allen Marquand, New Philadelphia, Ohio; Ohio Medical University, Columbus, 1902; member of the American Medical Association; county health commissioner; served during World War I; on the staff of the Union Hospital in Dover, where he died February 20, aged 72, of intestinal obstruction.

James Thomas Merwin, Athens, Ohio; Starling Medical College, Columbus, 1895; served during World War I; affiliated with the Sheltering Arms and Athens State hospitals; died Dec. 15, 1946, aged 80, of coronary thrombosis.

Arthur Jamieson Mitchell, New York; Eclectic Medical College of the City of New York, 1905; died Dec. 31, 1946, aged 79.

Chalmers Montgomery ⊕ Altoona, Pa.; Medico-Chirurgical College of Philadelphia, 1907; affiliated with the Altoona Hospital; died Dec. 9, 1946, aged 65.

Alfonso John Mooney Sr., ⊕ Statesboro, Ga., Atlanta Medical College, 1898; served during World War I; member of the Southeastern Surgical Congress; fellow of the American College of Surgeons; on the staff of the Bulloch County Hospital; past president of the Chamber of Commerce and the Rotary Club; died in a hospital at Savannah Dec. 12, 1946, aged 71, of bronchogenic carcinoma of the right upper lung.

James Milton Moore, Spring Hill, Kan.; College of Physicians and Surgeons, Medical Department of Kansas City University, Kansas City, 1900; member of the American Medical Association; served during World War I; died in the Bethany Hospital Kansas City, February 6, aged 76, of mitral insufficiency, ascites and prostatic enlargement.

Reginald Munson, Linden, Va.; Columbian University Medical Department, Washington, D. C., 1883; member of the American Medical Association; died Dec. 29, 1946, aged 88.

Walter Norem, Murfreesboro, Tenn.; University of Louisville (Ky.) School of Medicine, 1935; interned at the Methodist Hospital in Madison Wis.; past president of the Muscatine County Medical Society; served as health officer of Muscatine, Iowa, and as a medical missionary in Persia; entered the medical corps, Army of the United States, on Nov. 30, 1942; service terminated Jan. 8, 1946; on the staff of the Rutherford Hospital; died February 21, aged 37, of coronary occlusion.

Frank Hiram Pritchard, Colton, Calif.; Boston University School of Medicine, 1889; member of the American Medical Association; died Dec. 30, 1946, aged 79, of cerebral arteriosclerosis.

James Francis Quinn, New York; Yale University School of Medicine, New Haven, Conn., 1900; died January 31, aged 70, of heart disease.

Brad Rainwater, Dandridge, Tenn. (licensed in Tennessee in 1889); died February 25, aged 86, of carcinoma of the prostate.

Alvan Avery Rosenberry ⊕ Benton Harbor, Mich.; University of Michigan Department of Medicine and Surgery, Ann Arbor, 1909; past president of the Berrien County Medical Society; served as chief of staff of the Mercy Hospital; died February 18, aged 63, of coronary disease.

William Thomas Rothwell ⊕ Riverside, Calif.; College of Physicians and Surgeons of Chicago, School of Medicine of the University of Illinois, 1910; died January 19, aged 62, of coronary occlusion

Clifford Green Salt, Minneapolis; University of Minnesota Medical School, Minneapolis, 1921; member of the American Medical Association; died February 12, aged 63, of coronary sclerosis.

Lewis Milward Schrader ⊕ Kinsley, Kan.; University of Louisville (Ky.) Medical Department, 1905; served during World War I; died in St. Anthony Hospital, Dodge City, February 18, aged 67, of lobar pneumonia.

Marguerite E. Williams Scott, Philadelphia; Temple University School of Medicine, Philadelphia, 1918; member of the American Medical Association; died in the Clement Atkinson Memorial Hospital, Coatesville, Pa., recently, aged 71, of cerebral hemorrhage and hypertension.

S. Kenosha Sessions ⊕ Anna, Ill.; Northwestern University Woman's Medical School, Chicago, 1893; an Affiliate Fellow of the American Medical Association and member of the Indiana State Medical Association; for many years superintendent of the Indian Girls' School in Indianapolis; died January 27, aged 84, of cerebral hemorrhage.

William T. Shepard, Palo Alto, Calif., the Hahnemann Medical College and Hospital, Chicago, 1888; died in Agnews State Hospital, Agnew, January 30, aged 81, of arteriosclerosis.

Eugene Adams Smith, Bay Village, Ohio; Bellevue Hospital Medical College, New York, 1890; at one time associated with the city health department in Cleveland; died in Springfield, Ill, January 28, aged 79, of heart disease

Henry David Smyser, York, Pa.; University of Pennsylvania Department of Medicine, Philadelphia, 1900; member of the American Medical Association; formerly county coroner; served during World War I; on the staff of the York Hospital, where he died February 20, aged 73, of myocarditis.

Joseph Norman Smyth ⊕ Chicago; Loyola University School of Medicine, Chicago, 1933; affiliated with the Billings Memorial, St. Bernard's and St. George's hospitals; died February 23, aged 41, of carcinoma of the colon.

Garner P. Spaulding ⊕ Albion, Pa.; Cleveland Homeopathic Medical College, 1901; died January 25, aged 75, of coronary occlusion.

Arthur Bruce Steele ⊕ Santa Barbara, Calif.; Stanford University School of Medicine, San Francisco, 1931; served with the Canadian army in France during World War I; formerly member of the staff of the Santa Barbara County Hospital; president of the California Trudeau Society; died February 20, aged 49, of cerebral hemorrhage.

Leland Herbert Tower, Grosse Pointe, Mich.; University of Michigan Department of Medicine and Surgery, Ann Arbor, 1904; served during World War I; died February 12, aged 66.

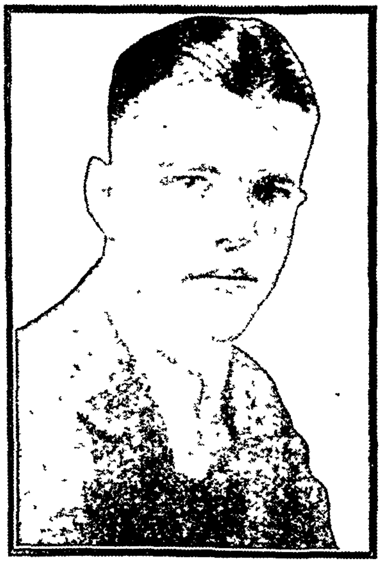
John W. Wade, Westville, Fla.; Georgia College of Eclectic Medicine and Surgery, Atlanta, 1913; died in Fort Walton Dec. 20, 1946, aged 62, of coronary occlusion.

Albert Hamilton Ward, Paterson, N J; Columbia University College of Physicians and Surgeons, New York, 1904; member of the American Medical Association; on the staff of St Joseph's Hospital; died February 10, aged 67, of coronary thrombosis.

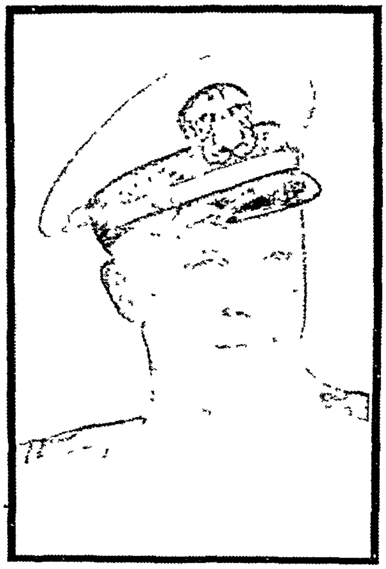
John Wade Watts ⊕ Colonel, U. S. Army, retired, Clearwater, Fla.; Medical Department of Tulane University of Louisiana, New Orleans, 1904; Medical Field Service School, Advanced Course, 1935; entered the medical corps of the U. S. Army as a major on July 1, 1920; promoted to lieutenant colonel April 6, 1937 and colonel on April 6, 1943; retired June 30, 1944 for disability in line of duty; died Aug. 19, 1946, aged 66, of heart disease.

Herbert Augustus White, Rye Beach, N. H.; Dartmouth Medical School, Hanover, 1901; formerly acting assistant surgeon in the U. S. Public Health Service; served as health officer and school physician; on the staff of the Exeter (N. H.) Hospital; died in Portmouth February 5, aged 68, of carcinoma of the lung.

Lieut. Henry De Vries
(MC), U. S. N. R., 1909-1944



Lieut. William DeBacker
M. C., A. U. S., 1914-1944



Lieut. Jerome William Greenbaum
(MC), U. S. N. R., 1914-1944

Michael Aloysius Tighe ⊕ Lowell, Mass; Harvard Medical School, Boston, 1908; secretary of the Massachusetts Medical Society; member of the House of Delegates of the American Medical Association in 1938; fellow of the American College of Surgeons; past president of the Middlesex North District Medical Society; served as city physician and associate medical examiner for Middlesex County; chief of the surgical staff at St. John's Hospital, where he died April 8, aged 65.

Roscoe Hiram Wigner, Enid, Okla.; Kansas City (Mo.) College of Medicine and Surgery, 1919; College of Physicians and Surgeons, Boston, 1926; died February 27, aged 61.

Samuel Zabarenko, Pittsburgh; University of Pittsburgh School of Medicine, 1910; member of the American Medical Association; examining physician for the draft board during World wars I and II; died in the Magee Hospital February 24, aged 60.

KILLED IN ACTION

Henry DeVries, Grand Rapids, Mich; University of Michigan Medical School, Ann Arbor, 1941; interned at the Dr. W. H. Groves Latter-Day Saints Hospital in Salt Lake City; began active duty as a lieutenant (jg) in the medical corps of the U. S. Naval Reserve in August 1942; promoted to lieutenant; killed in action June 12, 1944, aged 35, in Biak, Dutch New Guinea while on the U. S. S. *Kalk.*

William DeBacker, Boulder, Colo; University of Colorado School of Medicine, Denver, 1940; interned at the Kansas City General Hospital in Kansas City, Mo.; began active duty in the medical reserve corps of the U. S. Army in August 1941; prisoner on Bataan; survived the Bataan "Death March"; killed in action in the South China sea Oct. 24, 1944, aged 30, as the result of the sinking of a Japanese ship on which he was being transported while a prisoner of war.

Jerome William Greenbaum, Flushing, N. Y.; New York University College of Medicine, New York, 1938; served an internship and residency at the Willard Parker Hospital in New York, an internship at the Harlem Hospital and Bellevue Hospital in New York and a residency at the Mount Sinai Hospital in New York; began active duty as a lieutenant (jg) in the medical corps of the U. S. Naval Reserve on Aug. 2, 1943; later promoted to lieutenant; died in the Asiatic area off Leyte Dec. 7, 1944, aged 30, of multiple injuries.

Commonwealth and Empire Health and Tuberculosis Conference

The National Association for the Prevention of Tuberculosis has arranged a Commonwealth and Empire Health and Tuberculosis Conference from July 8 to 10 at the Central Hall, Westminster, London, S. W. 1. Delegates from twenty-three dominions and colonies have arranged to attend, in addition to visitors from many other countries, including the United States, France, Luxemburg and Portugal. The minister of health, Mr. Bevan, will speak on the first day on the National Health Service Act and its effect on the tuberculosis scheme. At the section dealing with the colonial tuberculosis services the secretary of state for the colonies, Mr. A. C. Jones, will speak. Many authorities from this country and overseas will participate in the discussions, including Dr. E. Berthelot (France), Dr. H. Corwin Hinshaw (Mayo Clinic), Dr. Esmond R. Long (United States), Dr. G. J. Wherrett (Canada), Dr. B. A. Dormer (South Africa) and Professor W. R. Tytler (England). Health officers and local government officials from all parts of Great Britain will attend and over 350 acceptances have already been received from both the medical profession and the lay public. Receptions for the members of the conference will be given by the Royal Society of Medicine and other bodies, and a number of visits and tours of both general and professional interest are being arranged, the latter being especially designed to show overseas visitors something of the antituberculosis work for which Britain is so well known. Visits have been arranged to such important institutions as the Brompton Hospital for Diseases of the Chest, King Edward VII Sanatorium, Midhurst, Papworth Village Settlement and the Redhill Chest Clinic.

The list of overseas representatives from twenty-seven countries includes four physicians from Australia, five from the United States, three from Canada, three from the Gold Coast and four from South Africa. The representatives from the United States are Dr. H. Corwin Hinshaw (Mayo Clinic), Dr. René Dubos (Rockefeller Institute for Medical Research), Miss A. C. Kemp (Reading, Pa., Tuberculosis Association), Dr. Esmond R. Long (director, Henry Phipps Institute) and Dr. Henry S. Willis (Mayo Clinic). From Canada there are Dr. Jean Gregoire (deputy minister of health, Quebec), Dr. H. A. Robertson and Dr. G. J. Wherett (Canadian Tuberculosis Association).

Streptomycin

American reports have raised high hopes in this country of the value of streptomycin. Appeals are made in the press by hospitals and doctors asking any one who may have a supply of the drug to send it, as it is required for a patient who is dangerously ill with tuberculous meningitis. The drug is not generally available in this country and is obtained from America only in limited quantity. The Ministry of Health has issued a warning on the subject, stating that trials are being carried out by the Medical Research Council, and until these have been completed it is not possible to assess the value of the drug and to determine the best methods of use. The latest American reports are regarded as indicating that the value of streptomycin in tuberculosis is still unproved. While the minister of health does not wish to hamper doctors and hospitals in their endeavors to obtain new drugs which may benefit their patients, he emphasizes that streptomycin is potentially dangerous and may cause ill effects such as giddiness and deafness. Insufficient is known about the drug at present to justify the government in making it more freely available. For instance, in a very small number of patients with tuberculous meningitis whose life has been prolonged by the treatment there has nearly always been permanent serious mental derangement, blindness or deafness.

Rest versus Activity in the Treatment of Fractures

In a presidential address to the Orthopedic Association Mr. George Perkins stated that the enormous advantages to be derived from activity of a fractured limb are not sufficiently recognized. Thus the hand is still immobilized for fracture of the scaphoid with the thumb abducted in the plane of the palm, instead of at right angles to it. In this faulty position the patient cannot oppose the thumb and fingers, and the use of the hand is seriously curtailed. The foot is immobilized in slight equinovarus instead of in the plantigrade position, so that there is great difficulty in walking. The advantages of encouraging activity of the limb are that rehabilitation can proceed hand in hand with bone repair, and the harmful effects of splintage are minimized. It is no longer necessary to apply an Unna's paste bandage after removal of a plaster for fracture of the tibia and fibula. Postplaster swelling has disappeared from the practice of those who make their patients walk normally while wearing a plaster cast.

Exercise for Free Joints

Mr. Perkins laid down the rule that all joints not immobilized by splintage should be moved actively by the patient. The splint should be shortened to the minimum, so as to free as many joints as possible. Longitudinal compression of the bone ends was the essential stimulus for bone (as opposed to fibrous tissue) repair. Hence the value of early weight bearing. Most surgeons would advocate it but for fear of overriding of the fragments, but Mr. Perkins's experience was that little is to be feared. He grants, however, that there is a danger in transverse fracture when the two fragments are not parallel, for a force not perpendicular to the line of fracture tends to angulate the fragments, distracting the raw bony surfaces from one another and stimulating the production of fibrous tissue.

Mr. Perkins holds that the main reason why a healthy joint stiffens as a result of splintage is that the muscles lose their power of lengthening. This can be prevented by making them contract and relax periodically throughout the period of immobilization. They need not be stretched to the full extent. In a fractured scaphoid the wrist can be immobilized for months without becoming stiff if the patient uses his fingers. A muscle under a splint will continue to act in a synergic capacity provided one of the joints over which it spans is free to move. If in fracture of the shaft of the femur both knee and hip are immobilized—as they must be if the splint is to keep the fractured ends from moving—the thigh muscles cannot act synergically because both origins and insertions are fixed. The consequence is a stiff knee. But if the hip is not splinted and the patient is encouraged to lift his leg (he need not bend the knee) the synergic action of the thigh muscles is retained and the knee does not stiffen.

Blood Transfusion Services

The Ministry of Health blood transfusion services have now been operating for some time. The country is divided into regions, each based on a university or medical school, and each region has its own transfusion service which bleeds donors and supplies blood to hospitals in the area and sends a percentage to the central laboratory in London to be made up as dried plasma. Standardization of apparatus, methods and scope of the service is effected through regular meetings of the regional transfusion officers at the Ministry of Health in London. Large quantities of blood were collected during the war, most of it for the fighting services, and it was not difficult then to secure an adequate number of voluntary blood donors. The theme

"Give blood for the men who shed it in your defense" was most successful and obtained a particularly large response from women. Now the picture changes. The spirit of altruism, so evident everywhere in the days of crisis, has not been well replaced by one of duty or of citizenship, and the call to "Give blood for your neighbor" has met with an increasingly poor response. It may be that the average man or woman feels that the present situation with its austere shortages and disappointments makes too great a demand already and that to yield up even a few drops of the precious stream in one's veins would be to invite disaster. Nevertheless blood donation remains on an entirely voluntary basis and no reward of money or of rations is offered to the donor, whose only recompense is some added prestige and the self satisfaction of a service done for another.

JERUSALEM

(From Our Regular Correspondent)

April 8, 1947.

The Leprosy Problem in Palestine

During the Dermatologic Congress in Jerusalem in October 1946 Katzenellenbogen, in commenting on the leprosy problem in Palestine, observed that the question of strict isolation of leprous patients has received different treatment in the past. He reported that a patient seen by him in Vienna in 1923 had spent a night in a hotel, and when this fact became known the hotel was closed for a fortnight. The opposite attitude was seen by him in a London hospital in 1935, where a leprous patient was lying in a general ward, his bed being separated from the others only by a screen.

In Palestine cases of leprosy are frequently seen by dermatologists because of the skin manifestations. There are about 400 persons with leprosy in Palestine, 25 of whom are living in the Jerusalem Leper Home. Internment is not enforced by law but is on a voluntary basis. When bacteriologic examinations have become negative, patients are usually discharged home. Control examinations at a later date, however, frequently show that the disease has made progress. Katzenellenbogen called to mind a patient who had consulted him because of tropical ulcers of the face and one foot in 1937 and mentioned that he was living in Bir Ajoub. This small Arab village is southeast of Jerusalem, and the patient had gone to live there fifteen years before, after having been discharged from the Jerusalem Leper Home. A second patient had been living for a long time in Bir Ajoub, where he went on being discharged from the Jerusalem Leper Home because the inhabitants of his village refused to admit him and chased him away. One group of inhabitants of Bir Ajoub are the wives of leprous persons who have been living in the Jerusalem Leper Home. The home does not accommodate families, and these couples must get out. At the time of the report there were 6 men aged between 30 and 50 and 8 women aged between 25 and 80 living in Bir Ajoub. Most of them are suffering from late stages of the disease, many displaying severe mutilations of the hands and feet, continuous fever and serious eye conditions. Hansen's bacilli are usually found in the nasal mucous membrane of those who are still presenting lepromas.

The medical and economic care of the inhabitants of the village is wholly insufficient. Patients who apply receive a bottle of chaulmoogra oil in the Jerusalem Government Hospital; those able to go there may receive injections. Most of them, however, are unable to visit the hospital, and even if their state of health permits they prefer going to the mosques of Jerusalem to offer their prayers and to beg alms. The Jerusalem municipality has a budget of 1 piaster (4 cents) per head daily. Bread is given to the patients by Moslem benevolent societies. The leprous of Bir Ajoub go voluntarily into this isolation.

The Journal of the Arab Medical Association

The *Journal of the Palestine Arab Medical Association* entered its second year in November 1946. The task before the editorial committee, as described in the preface to the first number of the second volume, concerns the most common local diseases, as leishmaniasis, leprosy, malaria, dengue fever and amebiasis. The editors state that "to an appreciable extent a primary aim of this journal has been upheld, viz. that of professional growth and a first step of bringing to all doctors all over the world a greater knowledge and understanding of problems of local disease." Mentioned is the pan Arab medical congress at Aleppo in August 1945, which was attended by over 500 doctors of the Near East. This congress approved a resolution to the effect that intensive research work should be carried out in diseases endemic to any of the countries participating in the congress by medical bodies in the countries concerned. Some of the diseases specially earmarked for this work were the Aleppo button (cutaneous leishmaniasis), malaria and eye diseases. Of greater significance was the decision of the committee of the conference to establish with the aid of Arab countries modern Arab health centers and institutions in Palestine. A first practical step toward this project was the immediate grant of £50,000. All this is heartening news to Palestine, and it is tangible evidence of the cooperation of Arab countries through their medical bodies and their special interest in Palestine.

Medical nomenclature and terminology in the Arab language received particular attention. In August 1945 Sir Allan Cunningham, the high commissioner, opened the first antituberculosis clinic in Jaffa.

Survival Time of Endameba Histolytica in Feces

J. Gurevitch and J. Delightish of the bacteriologic department of the Hebrew University, Jerusalem, have observed that actively motile trophozoites of Endameba histolytica can survive up to eight hours in a fecal specimen left at room temperature. In view of the scarce and contradictory reports in the literature on the survival of E. histolytica outside the body, a study was made on the effect of heat on the amebas. A stool containing motile amebas was divided into three portions, one of which was placed in the incubator at 37 C., the second portion was left at room temperature 25-30 C. (in the summer months) and the third portion was placed in the refrigerator at 6-8 C. Microscopic examinations of each of the three portions were made at two to three hour intervals until no living amebas could be detected.

Sixteen cases of amebiasis were examined and it was learned that at 37 C. the amebas survived only two to four hours. At room temperature the survival time was found to be significantly longer—from five to eight hours. To this must be added two to three hours that elapsed before a fecal specimen reached the laboratory. In all the portions of feces kept in the refrigerator, living amebas were found on three consecutive examinations during the day. These were left in the refrigerator overnight and were again examined the next morning, i. e. after twenty-four hours. At this time a few living weakly motile amebas were found in 2 cases; in 5 cases rounded nonmotile amebas could be detected; in 9 cases the results of the microscopic examinations were negative after twenty-four hours.

There can be no doubt that the best method for the diagnosis of amebas is the microscopic examination of a fresh fecal specimen given by the patient at the laboratory. But on the basis of the present study it may be concluded that in cases of delayed transport of stool to the laboratory the results of the examination are reliable enough if performed within six to eight hours. There is no advantage in keeping a specimen of feces at 37 C. until it can be examined. On the contrary, in cases in which immediate examination cannot be made it is advisable to preserve the stool in the refrigerator.

Correspondence

PERONEAL PALSY BY CROSSING THE LEGS

To the Editor:—The article in THE JOURNAL, March 15, by Majors Nagler and Rangell dealing with "Peroneal Palsy Caused by Crossing the Legs" brings to mind an interesting experience while I was serving at Borden General Hospital, Chickasha, Okla. In mid-July 1945 the hospital neurologist and I were assigned to investigate an outbreak of "paralysis" in a German prisoner of war camp at Alva, Okla., where some 5,000 Germans were maintained in four compounds (one officer, two noncommissioned and one enlisted man). During the months of June and July about 35 cases of peroneal palsy, chiefly unilateral, erupted in the officer and noncommissioned officers' compounds but spared the enlisted one. The main distinguishing feature between these groups was the fact that the enlisted men worked in the camp and neighboring farms while the other groups were inactive.

A constant finding was weight loss ranging from 10 to 25 pounds (4.5 to 11 Kg.) commencing several weeks prior to the outbreak and incident to a caloric reduction in diet prescribed by the service command. However, careful analysis of representative diets failed to reveal any deficiencies, though the total caloric intake per man averaged 2,000 calories daily. No evidence of vitamin deficiency was uncovered. Careful study ruled out such etiologic factors as hysteria, malingering, infection, toxins and artificial induction (by injection). Temperature curves, sedimentation rates, blood counts and spinal taps were normal.

Several patients claimed that initial manifestations were noted after they had maintained their legs crossed for several hours. This fact, together with the predisposing factors of weight loss and inactivity prominent in the paralyzed patients, led us to conclude that the causative agent was pressure and that the epidemic character of the outbreak was due to the general weight loss commencing several weeks before the appearance of the illness. This is in keeping with the observations made by the authors and others on the relationship of crossed leg palsy to weight loss and inactivity.

FRANK KAMINSKY, M.D., Brooklyn.

THE PHYSICIAN AS ADMINISTRATOR

To the Editor:—Two alternatives are recognized in the matter of who, if any one, should be director of a possible division of the government concerned with health and its ramifications: (1) a medical man or (2) a layman. As to the department handling food and drug matters, history might shed some light. While prior to 1906 the duties of this agency were performed while it was a part of the Department of Agriculture, running back to Civil War times, it became a potent institution for recognizing irregularities in food and drug production and distribution in 1907. Harvey W. Wiley was an aggressive member of the food and drug group, beginning in the capacity of chief chemist in 1883 and ending this service in 1912.

Since the founding of the American Medical Association in 1847, it has been interested in quality of drugs and during the lifetime of my father, a member from 1875 to 1890, the Association became more and more identified with the nature of therapeutic agents. It was natural that much of the burden of the pharmaceutical work fell to members of that vocation. Since 1820, beginning with the work of Lyman Spalding, to the present time, pharmacy and medicine have gone hand in hand with a healthy rivalry between them, as may exist now in the matter of who should direct a general group entrusted with safety in food and drug production. However this may be, the great advance made in regulation of drug and food commodities has been made through the participation of the medical man. A chemical compound of great merit could not become useful as an agent in maintenance of health and cure of disease without the imperatively necessary services of the physician. Today in the chemical laboratories there are hundreds of compounds synthesized in fine laboratories by expert chemists lying fallow because they have never been put to work by the physician, who alone can say whether they are justified or not. Pragmatically speaking, such compounds do not exist; that is, they are unrecognized. As in the Shakespearean sonnet, "Their worth's unknown until their height be taken." It is the physician and surgeon who take the height.

If the physician is the sine qua non, the decision then is easy: He must serve to direct the work of the food and drug division. Frequently it is said that the doctor is a poor business man Not all doctors are poor in business. Witness the medical men charged with the conduct of great hospitals, great humanitarian endeavors. Like Bishop Berkeley's blackberries, the thing to do is to find a good one.

One of the characterizations of today is the fact that men trained for a given type of work are displaced by those who are actually novices. A lawyer is made director of one of our most modern and important commissions, involving esoteric technical matter of life and death importance. A cloistered chemist is dragged from his laboratory and made president of a great institution of learning. In the case of the doctor as director of a health program, that is quite appropriate. That is his métier.

WITHROW MORSE, PH.D., New York.

CANCER TREATMENT BY AUTOVACCINATION

To the Editor:—In your correspondence of March 15 you publish a statement of Dr. Ludwik Gross about which I should like to comment. The first intracutaneous implantation of tumors in rats which established immunity against that particular tumor was performed by me 1927 at the University Institute for Cancer Research in Berlin (Knopf, Eduard: *Ztschr. f. Krebsforsch.* **25:**64).

A therapeutic experiment in a case of inoperable and radioresistant uterine cancer was performed at the Jewish Hospital in Berlin in 1930. The results were regression of the original tumor, changes in the histologic structure of the transplant and great improvement in the subjective symptoms of the patient lasting almost to the day of her death of circulatory failure (Knopf, Eduard, *ibid.* **32:**305).

The experiments conducted by Besredka and Gross in 1935 confirmed my observations in part. These authors implanted tumor particles intracutaneously into mice and thus induced immunity against the particular tumor which was used for the inoculation (Besredka, A., and Gross, L.: *Ann. Inst. Pasteur* **55:**402, 491, 1935). But the same authors had no success in treating 2 cases of breast cancer with intradermal inoculation of the original neoplasm. The implanted tumor grew in both cases and remained histologically identical with the original tumor (*ibid.* **60:**5, 1938).

The difference between the results of the 2 cases of Besredka and Gross, on the one hand, and my own and the 4 cases of Krasheninnikov, on the other hand, may perhaps be explained by the difference in the transplanted material. It appears that Besredka and Gross used material from the original tumor, while in my own and the 4 cases of Krasheninnikov material from metastatic lymph nodes was used.

If it is considered that an analogy exists between the immunity acquired in communicable diseases and that produced by intracutaneous implantation of tumor particles, one may feel justified in applying the principles of immunology to these experiments.

It is known that certain antigens are easily impaired by even small changes in physical and chemical conditions, and so it may well be assumed that tumor particles taken from an old primary tumor may have lost completely or in part their antigenic properties, while the relatively fresh material from a metastatic gland has still the full power to induce immunity.

Needless to say, the two negative cases of Besredka and Gross and my own and the 4 favorable cases of Krasheninnikov constitute too small a group to allow an evaluation of this treatment with intracutaneous implantation of the tumor. But I believe these experiments point the way toward further investigation of this technic on a larger scale.

Eduard Knoff, M.D., Brooklyn.

CONTINUOUS CAUDAL ANESTHESIA IN OBSTETRICS

To the Editor:—Dr. McCormick's correspondence (The Journal, March 15, p. 801) stressed the danger of continuous caudal anesthesia in obstetrics and mentioned a number of maternal deaths. The clinic with which I am associated has one of the largest series from any one clinic in the country. Since October 1942 we have used this method in 4,180 cases without a maternal death. There have been 3 cases of superficial skin infections which occurred during the first 500 cases. There was 1 fetal death attributable to it.

It is my belief that the fatalities can be prevented by a properly trained group working as a team. Such a plan calls for a resident and assistants. Our men are supervised until they have given fifty to sixty caudal anesthesias. And once a caudal anesthesia is instituted the patient has in constant attendance either an assistant resident or an intern who keeps accurate records of contractions, blood pressure and the fetal heart on caudal sheets which are used for that purpose only.

It is also my belief that caudal anesthesia in obstetrics is primarily an obstetric procedure requiring obstetric judgment as to when and under what circumstances it should be given.

Of course there is a mortality rate for this procedure as well as for any other form of anesthesia, but it shouldn't be high enough to warrant discontinuing its use

Francis R. Irving, M.D., Syracuse, N. Y.

SOCIAL MEDICINE IN SWEDEN

To the Editor:—The report on the new Swedish hospitals published on page 470 of The Journal dated Oct. 26, 1946 does not give a true picture. It is felt that your correspondent has gone too far. Conditions in Sweden and in the United States are quite different. In Sweden we have always had government directed medicine, just as we have had government directed education and government built railroads and water power plants.

The Swedes do not claim to have solved the problem of providing the best of medical care for all at reasonable cost. Neither do they claim, for instance, to have solved the housing problem with their very modern but rather small apartments. They are, however, progressive in their thinking and refuse to abide by old methods.

The two new giant hospitals in Stockholm probably represent an experiment to some extent, but they ought to be interesting also to American physicians. All facts concerning them should be presented fairly until enough experience is gained for a final judgment.

It is true that a visit to the polyclinic in Sweden entails two hours of waiting, or even more in some instances. All doctors in Sweden have their hands full. A patient who finds the waiting too long can see a doctor by appointment at his private practice, and the fee for this is higher but not too high.

The question of medical expense is considered of great importance in Sweden, where most people must budget their living expenses carefully. I am appending some figures on hospital costs and doctors' fees in Sweden today. A comparison with costs in the United States will show a great difference all along the line. Much can be said, of course, in favor of a system which strives to make the best of medical care available to all.

1. Hospital care in wards, containing 3 to 8 patients, $0.50 to $1 per day. (This includes all care, x-rays, doctors' services and operations of all kinds.)

2. Hospital care in room shared by two patients, $3 per day.

3. Hospital care in private room, $6 per day. (In some hospitals patients in private rooms or rooms for two are expected to pay the doctor a fee for operations. The fee varies between $10 and $100. A schedule of fees is available in the room, but payment is voluntary and the doctor does not present a bill.)

4. Medical care. The patient has the choice between visiting a polyclinic or seeing a doctor by appointment. Care at polyclinic: first visit $1.25, other visits $0.60 (waiting time one to three or four hours). The average fee for private visit to physician is about double the fees at polyclinic. Fees charged by specialists as a rule are higher but usually not as much as twice the fees paid at a private visit to a general practitioner.

G. Oldenburg, Consul General of Sweden.

PENICILLIN AS A BLOOD COAGULANT

To the Editor:—On January 12 I wrote you of my successful experience during the past two years using penicillin as a blood coagulant in otolaryngologic surgery. On January 24 I answered the reply of Dr. Fishbein in which he expressed interest. A supplementary letter from me which The Journal published referred to the observations of Frada, who too recognized that penicillin promotes blood coagulation. In order to bring the subject up to date, the following comments are added:

In confirming the research of Moldavsky and others Dr. David I. Macht in *Science* (**105**:313 [March 21] 1947) states that in the light of these experiments and the results outlined "there can be no doubt as to the accuracy and importance of the observations first reported by Moldavsky and his associates. . . . It is the opinion of the present writer that, next to the chemotherapeutic properties of penicillin and streptomycin and their low toxicity, the most important pharmacological finding is their thromboplastic activity."

My experience in the use of penicillin to promote blood coagulation agrees with that of Dr. Macht, who observed that among the commercial penicillins the amorphous (yellow) product is superior to the white crystalline penicillin in promoting coagulation of the blood. When these observations become known to the medical profession and as the use of penicillin as a blood coagulant becomes widespread, the superiority of the amorphous (yellow) penicillin for this purpose will also be recognized by other physicians. It is therefore essential that the commercial producers of penicillin be alerted so that some will continue the manufacture of the amorphous (yellow) penicillin. The trend at present seems to be toward converting facilities of manufacture to the production of the white crystalline penicillin.

Though the crystalline penicillin is more effective as an antibiotic, it is definitely less effective in promoting blood coagulation. This may be due to the presence of penicillin X with the penicillin G in the amorphous product.

Mort D. Pelz, M.D., St. Louis.

Medical Motion Pictures

FILM REVIEWS

Plaster Casts. 16 mm., black and white, sound, 1,400 feet (1 reel), showing time thirty-eight minutes. Produced during World War I by the Medical Department, U. S. Army. *Procurable on loan from Office of* the Surgeon General, U. S. Army, Pentagon Building, Washington, D. C. Attention: Chief of the Division of Education and Training.

This film is intended primarily for the instruction of those who aid in the application of plaster of paris casts to patients. It is not a film that would be useful at the professional level; that is, it would probably give a dull time to doctors who use plaster in their daily work. It depicts the preparation and proper storage of plaster of paris bandage. It illustrates completely and correctly the application of various forms of plaster cast used in everyday practice. More important, it points out the dangers that are associated with encasing a limb or trunk in plaster, and the methods that can be used to prevent the onset of trouble and to diagnose trouble before irreparable damage has been done.

A typical orthopedic workroom is shown. This includes the various tables that are used to place the patient in a desired position and the instruments that are used to remove the plaster. It shows the proper relationship between the plaster technician or aid in the plaster room and the surgeon who is responsible.

There is nothing about the technic or its presentation that is objectionable. It may all be considered good modern practice. This film should be particularly useful in training student nurses or as shown to senior medical students or interns before they begin to work in an orthopedic or fracture service. The photography is excellent.

Animated Hematology. 16 mm, color, silent, 1,600 feet (1 reel), showing time forty-five minutes (run at sound speed). Produced in 1946 by Mervin W. LaRue, Chicago. Technical advisers Carroll L. Birch, M.D., and Louis R. Limarze, M.D., University of Illinois School of Medicine. Procurable on loan or purchase from the Armour Laboratories, Medical Motion Picture Department, 1425 West Forty Second Street, Chicago 9.

This motion picture deals primarily with a subject in clinical hematology. Interest in this field has advanced very rapidly during the last decade and it is fitting to have a pictorial exposition on anemia, especially since the subject lends itself readily to this form of teaching.

A few criticisms are in order. Much of the material on the deficiency anemias was revolutionized during production of the motion picture, with the result that the newer advances respecting folic acid in both pernicious anemia and sprue are of necessity abbreviated. The diagrammatic sketches of magaloblasts and normoblasts are rather poorly done, as are the figures for myelocytes and metamyelocytes. There is a rather inadequate explanation of the gastric digestion of "extrinsic" with "intrinsic" factor. The word "Romberg" is misspelled as "Rhomberg." The remarkable improvement of a frank case of neurologic pernicious anemia with liver extract therapy in ten days seems almost incredible.

The film is distinguished by good photography although much of the material could be presented with a series of lantern slides. The sequences dealing with the intramuscular injections of parenteral liver extract and with cirrhosis of the liver are unusually good. Educational values are enhanced by constant repetition of basic principles and by simplification of the fundamental physiopathologic processes in anemia.

Folvite. 16 mm., color, sound, 800 feet (1 reel), showing time twenty-two minutes. Produced in 1946 by Paul Hance Productions, Inc. Procurable on loan from Lederle Laboratories, Inc., Film Library Division, 30 Rockefeller Plaza, New York.

This report type film presents a superficial treatment of the actions of folic acid in the treatment of macrocytic anemias. The repeated use of the trade name "Folvite" through the picture destroys any educational value which it might possess and converts it to an advertising medium for the manufacturer. Although excellent color photography presents the classic lesions of pernicious anemia and sprue, little scientific information is given concerning the actions or uses of folic acid.

The results of treatment are presented in the form of obnoxious testimonials.

This film cannot be recommended as an educational aid.

Bureau of Legal Medicine and Legislation

MEDICOLEGAL ABSTRACTS

Drunkenness: Obtaining Specimen for Chemical Test Not Unlawful Search and Seizure.—The defendant was convicted of driving an automobile while under the influence of an intoxicating liquor, and he appealed to the municipal court of appeals for the District of Columbia.

Some time after the defendant's arrest, and while he was at a police precinct station, a uniformed police officer attached to the Accident Prevention Unit requested a sample of the defendant's urine, and the defendant agreed to give it. At that time he appeared lucid and answered questions clearly. The officer did not inform the defendant that he had a right to refuse to give the sample or inform him that the sample might be used as evidence against him but did state that "if the sample were right it would be to the defendant's benefit." At the trial the judge, over objection, admitted in evidence the laboratory records of the analyses of this sample. Dr. Hunter, physician and pathologist, whose qualifications as an expert were admitted, thereupon answered a hypothetical question by stating that in his opinion a chemical analysis of "the sample of urine" showing 0.24 of 1 per cent of alcohol "indicated that the defendant was under the influence of intoxicating beverage at the time of his arrest."

The defendant first contended that testimony regarding a urinalysis of a specimen taken while he was under arrest was improperly admitted because insufficiently identified and because there was insufficient evidence that the specimen was in the same condition when taken as when analyzed. We agree, said the court, that it was incumbent on the government to prove that the specimen taken from the defendant and the one analyzed by the chemist, and reported on in court, were the same and were in substantially the same condition when tested as when taken. We think, however, that there was sufficient evidence to justify the trial judge in holding that the evidence met this test.

The defendant next contended that his rights under the Fourth Amendment had been infringed. That amendment guarantees that "The right of the people to be secure in their person, . . . against unreasonable searches and seizures, shall not be violated." Here, said the court, it is conceded that the defendant had been legally arrested and was legally detained when the specimen was taken. Evidence obtained from a person under legal arrest is admissible over an objection grounded on illegal search and seizure, and the same rule applies to a chemical analysis of such evidence.

Finally the defendant contended that the taking of the specimen, and the use in evidence of the analysis of its contents, violated his rights under the Fifth Amendment guaranteeing that "No person . . . shall be compelled in any criminal case to be a witness against himself . . ." The defendant argued that the specimen was given as a result of inducement or duress or both and that therefore, as is the case with an oral confession given as the result of inducement or duress, it should not have been considered in evidence. The duress claim was based on the fact that when the specimen was taken the officer was in uniform, and defendant was under arrest, was not informed that he had a right to refuse to give the sample and was not advised that it might be used against him in evidence The inducement claim was based on the officer's statement to defendant that "if sample were right it would be to the defendant's benefit." Assuming, said the court, that the taking of a body fluid is governed by the same rules of evidence as apply to oral utterances, we rule that there was neither duress nor inducement in the sense that would make the giving of the specimen involuntary. The record shows affirmatively that, at the time the specimen was given, the defendant appeared lucid and answered questions clearly and that he gave the specimen after a request therefor. There was no suggestion that the defendant was of subnormal intelligence nor suggestion of any other surrounding circumstances which have led to the rejection of statements or confessions. Statements are frequently taken by officers in uniform while defendants are under arrest, and "it is not essential to the admissibility of a confession that it should appear that the person was warned that what he said would be used against him; but, on the contrary, if the confession was voluntary, it is sufficient though it appear that he was not so warned." Furthermore, continued the court, we do not believe that the officer's statement was an "inducement." It was as though the officer had said "If you are innocent, making a statement will help you." A person of ordinary intelligence would draw from the officer's statement the inference that if the specimen was not "right" it would not be to the defendant's benefit. We therefore hold, concluded the court, that the trial judge was justified in ruling that the specimen was given voluntarily and that the admission of the analyses in evidence was proper. The defendant's conviction was accordingly sustained.—*Novak v. District of Columbia, 49 A. (2d) 88 (Dist. of Col., 1946).*

Building Restrictions: Right to Maintain Medical Office in Private Home.—The plaintiffs petitioned for an injunction to restrain the defendant from practicing medicine in a residential district. From a judgment for the defendant, the plaintiffs appealed to the Court of Civil Appeals, Galveston.

The plaintiffs and the defendant purchased homes and property in a real estate subdivision in the city of Houston. All of the lots in the subdivision were sold subject to certain restrictive covenants or building restrictions. These restrictions provided, among other things, for a Business Center in the subdivision and stated that only one physician's office should be maintained in the Business Center. The restrictions also provided:

> A. All lots in the tract shall be known and described as residential lots except that portion designated on the plat as a business center. . . . No structure shall be erected, altered, placed or permitted to remain on any residential building plot other than one detached, one family dwelling. . . . and a private garage with servant's quarters and other outbuildings incidental to the residential use only of the plot. . . .
>
> E. No noxious or other offensive trade or activity shall be carried on upon any lot nor shall anything be done thereon which may be or become an annoyance or nuisance to the neighborhood.

The defendant and his wife maintained their place of abode in this subdivision and, in addition to using the building for a residence, the defendant set aside one room which he uses in connection with his medical practice. The defendant is an elderly man, and from the evidence an inference could be drawn that he was semiretired. His practice was relatively light. He accepted only cases of rectal diseases and such as came to his place of residence. These averaged, said the court, about one patient a day. It was not contended that the treatment by the defendant caused his patients to cry out. The plaintiffs contend that, by using his home for the conduct of his medical practice, the defendant is not using it for "residential use" only and that they are therefore entitled to restrain the defendant from such use.

The primary question, said the court, is whether the practice of medicine by a physician in or from his home constitutes a violation of the restriction against using same for other than residential use. At the time defendant purchased the lot he inquired of the president of the corporation owning the addition whether the restrictions imposed on the lots would prevent him from receiving and treating patients there. Such president replied that he did not think so. Since said corporation was not a plaintiff and did not contend that defendant by the practice of medicine was guilty of a violation of the covenant to use the lot for residential purposes, such evidence was probably not relevant to any issue in the case. Indeed, continued the court, the legal effect of the restrictions was a question of law; and the effect of such restrictions is well settled. "Restrictive clauses in instruments concerning real estate must be construed strictly, favoring the grantee and against the grantor, and all doubts should be resolved in favor of the free and unrestricted use of the premises. . . . it is contrary to the well recognized business policy of the country to tie up real estate where the fee is conveyed with restrictions and prohibitions as to its use; and, hence, in the construction of deeds containing restrictions and prohibitions as to the use of the property by a grantee, all doubts should, as a general rule, be resolved in favor of a free use of the property and against restrictions." Continuing, the court said that courts judicially know that the purpose of restricting lots in subdivisions to residential use is to establish an area free from commercial activity and thereby enhance the value of such lots as residential property. The word "residential" as used in a covenant restricting the use of property is used in contradistinction to "business" or "commerce." A building used as a place of abode, and in which no business is carried on, is devoted to a "residential use" so long as such use continues. The practice of medicine is, of course, a means of livelihood. But in its ordinary sense it is not a trade and is not a business, or commercial, or offensive activity when ethically conducted. It is a learned calling and lacks the bustle and noise associated with a commercial activity. It would probably be impossible for a physician to practice his profession and never use his home as a place to receive calls or patients. In the instant case, as appears above, the doctor maintained a room in his home to receive and treat patients and did not maintain an office elsewhere. The restrictions here in question were reasonably susceptible to the construction that the limitation to residential use was not intended to prevent a physician from practicing his profession in and from his home. If the restrictions are reasonably subject to the construction which permits such use, then, said the court, they must be so construed. No Texas case was cited holding that covenants restricting a lot to residential use are violated by a physician who resides on such lots and practices medicine in his home. In our opinion, the court concluded, the mere fact that a physician practices medicine in his home is not sufficient to show a violation of a covenant to use same only for residential use. Accordingly the judgment in favor of the defendant was affirmed.—*Briggs v. Hendricks, 197 S. W. (2d) 511 (Texas, 1946).*

Medical Examinations and Licensure

COMING EXAMINATIONS AND MEETINGS

BOARDS OF MEDICAL EXAMINERS
BOARDS OF EXAMINERS IN THE BASIC SCIENCES

Examinations of the boards of medical examiners and boards of examiners in the basic sciences were published in The Journal, May 3, page 95.

NATIONAL BOARD OF MEDICAL EXAMINERS

National Board of Medical Examiners: *Parts I and II.* Various centers, June 16-18. *Part III.* Various centers, June. Durham, Oct. 21-23. Sec., Mr. Everett S. Elwood, 225 S. 15th St., Philadelphia 2.

EXAMINING BOARDS IN SPECIALTIES

American Board of Anesthesiology: Part II. *Oral.* Cleveland, Oct. 5-11. Sec., Dr. P. M. Wood, 131 Riverside Dr., New York 24.

American Board of Internal Medicine: *Written.* Various Centers, Oct. 20. Final date for filing application is June 1. Asst. Sec., Dr. W. A. Werrell, 1 West Main St., Madison 3.

American Board of Neurological Surgery: Oral. Chicago, June 4-5. Sec., Dr. Paul C. Bucy, 912 S. Wood St., Chicago.

American Board of Obstetrics and Gynecology: *Part II.* Pittsburgh. June 1-7. Sec., Dr. Paul Titus, 1015 Highland Bldg., Pittsburgh.

American Board of Ophthalmology: Philadelphia, June 15-19. Chicago, October 6-12. Sec., Dr. S. Judd Beach, 704 Congress St., Portland, Me.

American Board of Orthopaedic Surgery: Part II. Chicago, Jan. 22-23. Final date for filing applications is Sept. 15, 1947. Sec., Col. F. M. McKeever, 1136 W. Sixth St., Los Angeles 14.

American Board of Otolaryngology: Chicago, Oct. 7-11. Sec., Dr. D. M. Lierle, University Hospitals, Iowa City, Ia.

American Board of Pathology: Chicago, Oct. 24-25. Final date for filing application is Sept. 15. Sec., Dr. Robert A. Moore, Euclid Ave. and Kings Highway, St. Louis 10.

American Board of Plastic Surgery: Examinations are given in April and November of each year in the home town of applicants. Applications should be sent to Sec., Dr. Robert H. Ivy, c/o Clerical Secretary, 4647 Pershing Ave., St. Louis 8.

American Board of Psychiatry and Neurology: New York, December. Final date for filing application is Sept. 15. Sec., Dr. Francis J. Braceland, 102-110 Second Ave., S. W., Rochester, Minn.

American Board of Radiology: Boston, Nov. 26-30. Sec., Dr. B. R. Kirklin, 102-110 Second Avenue, S. W., Rochester, Minn.

American Board of Surgery: Final date for filing application for the next written examination is July 1. Sec., Dr. J. Stewart Rodman, 225 S. 15th St., Philadelphia.

American Board of Urology: Chicago, February. Final date for filing application is Nov. 1. Sec., Dr. Harry Culver, 1409 Willow St., Minneapolis 4.

Current Medical Literature

AMERICAN

The Association library lends periodicals to members of the Association and to individual subscribers in continental United States and Canada for a period of three days. Three journals may be borrowed at a time. Periodicals are available from 1937 to date. Requests for issues of earlier date cannot be filled. Requests should be accompanied with stamps to cover postage (6 cents if one and 18 cents if three periodicals are requested). Periodicals published by the American Medical Association are not available for lending but can be supplied on purchase order. Reprints as a rule are the property of authors and can be obtained for permanent possession only from them.

Titles marked with an asterisk (*) are abstracted below.

*Glaucoma Following Ingestion of Sulfathiazole. M. H. Fritz and M. Kesert.—p. 197.

Postneuritic Optic Atrophy.—Roberts and Willcockson say that since the return of personnel from the Japanese prisoner of war camps most ophthalmologists in army and navy hospitals have seen permanent visual impairment which in all probability is nutritional in origin. They report 6 typical cases of severe ocular disability the onset of which was concomitant with extreme dietary deprivation.

Glaucoma Following Ingestion of Sulfathiazole.—Fritz and Kesert report the history of a woman aged 24 who came to the eye clinic April 11, 1945 complaining of itching, light sensitivity and burning of both eyes. The patient thought she was sensitive to sulfathiazole, having developed red, burning eyes following the ingestion of sulfathiazole prescribed for a sore throat in August 1944. She had reported this to the medical officer who had seen her in her unit dispensary because of a sore throat on April 10, 1945, but he told her to try the drug again. On April 13 her eyes had the typical appearance of acute congestive glaucoma. Tension was 50 and 60 mm. respectively. Treatment with physostigmine salicylate was instituted and was discontinued on April 18. From that date until her discharge on April 21 tension remained 22 mm. in each eye and the eyes continued to improve, until they were considered normal on the day of discharge.

Normal and Pathologic Physiology of Parathyroid Glands. F. R. Keating Jr.—p. 129.

Fluorine and Dental Caries.—Epidemiologic studies of relationship between the amount of dental caries (permanent teeth) in 7,257 selected 12 to 14 year old white school children of twenty-one cities of four of the United States and the fluorine content of public water supply revealed that 847 children continuously using a domestic water containing more than 1.4 parts per million of fluorine averaged 2.4 decayed, missing or filled teeth per child; 1,403 children of cities whose water supplies contained between 1.0 and 1.4 parts per million of fluorine showed 2.9 affected teeth per child. In the 1,140 children of cities whose public water supplies contained 0.5 to 0.9 part per million of fluorine an average of 4.2 teeth per child showed evidence of past or present dental caries attack, while in the 3,867 children of cities whose common water supplies contained less than 0.5 part per million of fluorine an average of 7.4 teeth per child showed evidence of having experienced dental caries. Other independent studies in the United States, England, South Africa and India report similar findings. Bacteriologic, chemical and animal experiments (on rats and hamsters) consistently support the fluorine-dental caries relationship as disclosed by these epidemiologic observations. Dean concludes that domestic water supplies may be classified on the basis of dental health in those carrying naturally the optimal concentration of fluorine, i. e. about 1.0 part per million, no treatment being required; those carrying an excessive concentration of fluorine requiring the removal of the excess in order to protect the population against endemic dental fluorosis; those deficient in fluorine to which fluorides might be added to bring its concentration up to the optimal in order to lessen the amount of dental decay in the community.

Ammonia Production in Oral Cavity.—By testing culture filtrates of Lactobacillus acidophilus, which has the ability of rapidly converting glucose into acid and is probably in a large measure responsible for this action in the saliva of caries-active people, Kesel and his co-workers observed that ammonia nitrogen developed in human saliva by natural processes has the ability to inhibit the growth of Lactobacillus acidophilus. The inhibition of the lactobacilli is not due to the alkalinity which the ammonia might provide, for the same alkalinity established by sodium acetate had no inhibiting action. Dibasic ammonium phosphate used by 122 persons orally in a mouth rinse and dentifrice caused a decided reduction in the oral lactobacillus counts but has not reduced the number in some of the persons to a level that would indicate an arrest of dental caries. In vitro experiments indicated that a combination of 5 per cent dibasic ammonium phosphate and 3 per cent urea is more effective as an antibacterial and antiacidic agent than is either of these substances alone. It appears from bacteriologic observations that the use of an ammonium-containing dentifrice and mouth rinse as employed by the average person may not completely check caries activity. Other measures, particularly dietary management, may be necessary to establish at least initial control.

*Myiasis of the Nose. N. P. Popov.—p. 112.
Aerodynamics in Physiology of Upper Respiratory Tract. N. V. Peterson.—p. 117.

Radiation in Removal of Adenoid Tissue.—Proctor says that radiation therapy for the elimination of adenoids has been used for over twenty years. During the past three years at the Hagerstown Clinic 400 patients have been so treated. These patients received, in addition to radiation therapy, surgical treatment of the tonsils or the adenoids when indicated (mastoidectomy or nasal operation in some instances) and local treatments to the sinuses, the nose or the ears. Adenoidectomy is not in itself a completely satisfactory answer to the problem of infected and enlarged nasopharyngeal lymphoid tissue. Irradiation of this tissue with radium emanation is a valuable adjunct to surgical removal and is often of great help by itself. Good results have been obtained by radium irradiation of the nasopharynx combined with adenoidectomy or other orthodox methods of treatment—or by radium irradiation alone—in the treatment of deafness due to chronic interference with the function of the eustachian tubes, recurrent infections of the upper respiratory tract, recurrent acute infection of the ear, chronic infection of the ear and bronchial asthma.

Myiasis of the Nose.—Popov reports 3 cases of myiasis that were observed by him in southern California. One of the 3 patients, an imbecile youth aged 20, died. Myiasis is caused by the hatching of eggs laid within the nose by a fly. The foul odors of a chronic catarrhal inflammation, syphilitic rhinitis, atrophic rhinitis or ozena attract the fly. The pathologic effects of the disease consist of a more or less total destruction of the mucous membrane lining the nasal and accessory cavities of the nose. The larvae denude the bone and cartilage and in the later stages burrow through the thin bony plates. In cases that have resulted fatally great numbers of larvae were found in the brain substance. The treatment of this disease has been complicated by the ability of the maggots to survive in many antiseptic solutions. The author has used a 10 per cent solution of chloroform in milk as a nasal spray and removed the maggots mechanically with forceps from the nose at several sittings each day. By such a procedure the maggots are gradually removed from the nose. Sneezing will also dislodge great numbers of the larvae. There are a number of insects with a wide geographic distribution whose larvae may attack the human nose.

Streptomycin in Brucellosis.—Pulaski and Amspacher say that streptomycin administered parenterally, orally or in combination did not have demonstrable value in the treament of 7 patients with acute and 10 patients with chronic brucellosis. Treatment with streptomycin and sulfadiazine of 2 patients with acute brucellosis effected a prompt response, with clinical arrest of the disease. While still in the experimental stage, the combination of streptomycin and sulfadiazine as adjuvant therapy for brucellosis deserves further trial. A dose of 0.5 Gm. of streptomycin intramuscularly and 1 Gm. of sulfadiazine orally every four hours for a period of two weeks or onger is recommended. Streptomycin alone is not recommended for the therapy of brucellosis.

Allergy to Typhus Vaccine in Egg Sensitive Subjects.—Hampton presents the histories of 2 patients who had an anaphylactic shock following parenteral injections of typhus vaccine prepared from chick embryos infected with epidemic typhus rickettsia. Intradermal skin tests, passive transfer tests and neutralization experiments with serum from the 2 patients indicated a likely antigenic identity of typhus vaccine and the egg and chicken meat antigens contained therein. Hampton advises that all candidates for typhus vaccine injections or other similar chick embryo vaccines be questioned for possible egg sensitivity and that all probable egg sensitive persons be skin tested with typhus vaccine prior to parenteral administration of it. A suggested initial testing strength is a 1:100 dilution of the vaccine using approximately 0.02 cc. volume. Since influenza virus vaccine (types a and b) is prepared from infected chick embryos, it is suggested that the same precautions be taken with thir vaccine.

Seasonal Variations in Vitamin A and Carotene Content of Butters.—In the course of a two year period more than 150 samples of commercial butter were assayed by Ellenberger and his associates. These samples represented five nationally advertised brands of butter purchased on the retail market and one brand purchased at a local creamery. Preliminary to and during the course of these assays, studies relating to methodology were carried out for the purpose of checking or improving methods of assay. Although distinct seasonal variations in the carotene and vitamin A content of butters as purchased on the retail market in Pennsylvania were noted, there was no indication that any one brand of butter was constantly higher or constantly lower than other brands with respect to either vitamin A or carotene. With few exceptions the vitamin A content of butter was found to exceed the carotene content (in terms of both weight of material present and international unit equivalent) at all seasons of the year and also showed less seasonal variation. The average yearly vitamin potency of the six brands of butter was found to be 15,640 international units per pound.

Rutin in Treatment of Increased Capillary Fragility.—Rutin, a flavonal glucoside, is a constituent of many plants, including buckwheat, forsythia, tobacco, garden rue, violets and elder flowers. Zfass reviews observations on 13 patients who were selected from a total of 60. Only patients who showed an increased or borderline capillary fragility were chosen for rutin therapy. The usual dose was 20 mg. orally three times a day. Eight of the 13 patients had considerable hypertension. It was found that rutin restores increased capillary fragility to normal. One of 2 patients who were treated with potassium thiocyanate developed increased capillary fragility, but rutin restored the fragility to normal. The use of thiocyanate in the treatment of hypertensive arteriosclerotic heart disease is dangerous once the patient has an increased capillary fragility. The drug is apparently harmless if the capillary fragility remains normal. Once the capillary fragility is returned to normal with rutin, thiocyanate can be used as an adjunct indefinitely without increasing the fragility. Rutin may prove a valuable drug in preventing cerebral vascular accidents and insidious bleedings. The blood pressure was only slightly lowered in 3 of 10 hypertensive patients who received rutin on account of increased capillary fragility, but the retinal hemorrhages of 3 out of 4 patients subsided under treatment with rutin.

Dust Control in Measles Wards: Sulfadiazine Prophylaxis.—Begg and his associates report an investigation into the control of dust borne hemolytic streptococci in two identical measles wards. In one, the oiled ward, all bed clothes, patients' garments and ward linen were treated with technical white oil, and the floor of the main ward was oiled. In the unoiled ward no anti-dust measures were taken. In both wards the air was sampled for total bacteria and for hemolytic streptococci during bed making and sweeping, and the streptococcic cross infection and complication rates were recorded. The oiling methods were successful in suppressing dust borne bacteria. This was shown by the fact that the mean total bacterial count was reduced, when compared with the count for the unoiled ward, by 92.3 per cent during bed making and by 79.1 per cent during sweeping. The cross infection rate among 186 measles patients nursed in the unoiled ward was 12.4 per cent and among 190 patients in the oiled ward 20.5 per cent. These cross infections appeared to be due to contact rather than to air borne infection. The fact that this type of cross infection was higher in the oiled than in the unoiled ward was unexplained. The complication rate due to streptococcic cross infection was exceedingly low; only 1 case of streptococcic otorrhea due to cross infection occurred among the total of 376 patients nursed in the two wards. In order to evaluate chemoprophylaxis of streptococcic cross infection in measles, a third study ward was set up. The complete absence of complications attributable to streptococcic cross infection in the sulfadiazine ward and the low bacteriologic cross infection rate justify a further attempt to evaluate the question of sulfonamide prophylaxis in measles.

Neurologic Complications in Atypical Pneumonia.—Holmes describes 6 cases in which symptoms of severe spinal and cerebral lesions occurred in association with pulmonary lesions presenting the radiologic appearances of "atypical pneumonia." Recovery was rapid and complete. Although the clinical picture was variable, it was in each case suggestive of a virus infection of the nervous system. A review of the literature suggests that the nervous system is rarely involved in atypical pneumonia but that when this does occur the tendency is toward complete recovery without sequelae.

*Molluscum Contagiosum. R. C. Low.—p. 657.
Problems in Arterial Surgery. F. Albert.—p. 671.
High Blood Pressure. J. G. M. Hamilton.—p. 683.
High Blood Pressure. A. T. B. Dickson.—p. 688.

Molluscum Contagiosum.—According to Low, molluscum contagiosum is a raised solid hemispherical projection of the same color as the normal skin or slightly redder. The center of each lesion usually shows a small depression. The lesion begins as a minute pin point elevation and grows slowly till it reaches the size of a large pea. The incubation period varies from one to six months. The lesions may persist for weeks or months. If left alone, some of them may shrink and gradually disappear, but the natural method of cure is by secondary infection. At the Royal Infirmary of Edinburgh about 78 cases are seen annually in an average of 39,000 skin cases. Molluscum contagiosum is due to infection of the epithelial cells of the skin with a filtrable virus elementary body. This virus elementary body is contained in the cell inclusion commonly known as the "molluscum body." The diagnosis can be established by microscopic demonstration of molluscum bodies. The disease is often spread by public bathing establishments. The best treatment is to squeeze out the contents of each lesion and insert a drop of pure phenol (carbolic acid) on a probe or dental burr. Usually one application will cure a lesion of ordinary size, leaving no scar. Early minute lesions can be cured by simply touching them with the pure phenol.

Field Tests on Some Pyrethrum Anti-Mosquito Repellent Creams Against Woodland Species of Aedes in Britain. C. G. Johnson.—p. 32.

Antimony Compounds.—Gellhorn and his associates determined the plasma antimony concentration on 40 Puerto Rican patients infected with Wuchereria bancrofti. The patients were asymptomatic but microfilarie were easily demonstrable in the peripheral blood. The following antimony compounds were administered by intravenous injection: lithium antimony thiomalate (anthiomaline), potassium antimony tartrate (tartar emetic), antimony-bis-catechol disulfonate (Fuadin), N-glucoside of stibanilic acid (Neostam), diethyl amino ethanol of sodium antimony gluconate (Stibanose) and a brand of ethylstibamine (Neostibosan). Plasma samples were obtained at about the midpoint and at the end of the therapeutic course. The highest antimony concentrations were attained in the plasma of patients receiving Neostibosan; much lower plasma antimony concentrations were observed in persons receiving Neostam, and only traces could be detected following the injection of Stibanose and all the tervalent antimony compounds. Neostibosan seems to be the chemotherapeutic agent of choice against antimony susceptible parasites which are present in the blood stream. The urinary excretion of Neostibosan and Fuadin antimony was determined in 5 patients and it was found that the quinquevalent antimony of Neostibosan is excreted to a far greater extent than is the tervalent antimony of Fuadin. This shows the greater toxicity of tervalent compounds compared to quinquevalent compounds.

Asphyxia: Statistical Study. P. Genaud.—p. 39.
Posology of Sulfathiazole. R. Eyckmans.—p. 41.

Pancreatitis and Diabetes Mellitus.—Pavel reports 2 cases of diabetes mellitus in boys aged 15 and 5 whose brother and mother respectively had mumps three and two years previously and had lived with them in the same apartment. Three cases of diabetes mellitus are reported in which this disease occurred after an attack of catarrhal jaundice. One case of temporary glycosuria and 1 case of diabetes mellitus after scarlet fever are also reported. A pronouced diastasuria was observed in convalescents after pneumonia. In contrast to the opinion of other workers in diabetes, pancreatotropic infection is to be considered as an etiologic factor in diabetes mellitus. The infection may be the primary and direct cause of diabetes mellitus or a secondary cause in a patient with hereditary disposition, or it may be a predisposing factor in the presence of other factors such as overfeeding, hyperfunction of pituitary or pancreatitis. Glutting on a diet rich in sugar is contraindicated during convalescence following these types of infection.

*Permanent Results After Total Extirpation of Stomach on Account of Carcinoma. H. Finsterer.—p. 17.
Is Retroflexion of Uterus a Disease Entity? H. Heidler.—p. 24.
What Does Electricity Accomplish in Treatment of Paralysis? J. Kowarschik.—p. 27.

Results of Total Extirpation of Stomach.—Finsterer thinks that neither advanced age nor great emaciation is a contraindication to total extirpation of the stomach. Among the 89 patients on whom he performed this operation there were 62 over 50 years of age, which is a much higher percentage of elderly patients than appear in other statistics. In a total extirpation of the stomach not only the entire organ but also a part of the duodenum and of the esophagus should be included. A direct anastomosis can be made between the esophagus and the jejunum. This extensive resection is justified in spite of a relatively high mortality rate because it is the only method with a prospect of cure. Of Finsterer's 89 patients 54, or over 60 per cent, died within the first three and a half months after operation. By improvement in the surgical technic and by changing the indication during the operation, when it is discovered that the carcinoma has extended to the pancreas, liver or colon, the mortality rate has in recent years been reduced to less than 50 per cent. The surviving patients demonstrate that the removal of the entire stomach is tolerated by the organism and is not necessarily followed by severe anemia.

*Characteristics of Blood in 3 Cases of Icterus Gravis. A. van Westrienen and M. Sprangers.—p. 350.

Blood Characteristics in Icterus Gravis.—Van Westrienen and Sprangers encountered difficulties in the treatment of 3 instances of hemolytic disease of the newborn. Transfusion of Rh positive blood had a favorable result in the first infant, autoagglutination subsiding after five days. In 2 infants whose serums held anti-Rh agglutinins the same therapy could not be applied, as all available Rh positive donors showed agglutination of their erythrocytes. Agglutination tests should always be performed before transfusion, especially when using Rh positive donors.

*Causes of Hemoptysis. J. C. Gerrits.—p. 1884.
Distribution of Methyl Alcohol Throughout the Body. J. C. de Jong and R. van Dam.—p. 1889.

Causes of Hemoptysis.—Gerrits says that, of the 2,322 patients who visited the outpatient department of his clinic in the years between 1941 and 1946, 192, or 8 per cent, came on account of hemoptysis. Besides pulmonary tuberculosis, chronic tracheobronchitis was an important etiologic factor. Chronic tracheitis with accompanying hemopytsis was especially frequent during the influenza epidemic in the winter of 1945-1946.

*Study in Pseudoglaucoma: (Glaucoma Without Hypertension). H. Sjögren.—p. 239.
*Eye Symptoms in Poliomyelitis Anterior Acuta. P. Kindt and K. Knudtzon.—p. 195.

Pseudoglaucoma (Glaucoma Without Hypertension).—According to Sjögren, pseudoglaucoma or glaucoma without hypertension is characterized by the typical symptoms of chronic glaucoma but with the difference that the cardinal symptom, increased intraocular pressure, is not present. The author cites facts which indicate that it is absurd to draw a dividing line at 30 mm. intraocular pressure, thereby creating two separate diseases, glaucoma and pseudoglaucoma. He thinks that glaucoma and pseudoglaucoma are one and the same disease.

Eye Symptoms in Acute Anterior Poliomyelitis.—Kindt and Knudtzon found that during the extensive epidemic of poliomyelitis in 1944, when 279 patients with this disease were admitted to the Frederiksberg Hospital, a rather large number had eye symptoms. Of the 37 patients presenting symptoms of the brain stem, 23 had eye symptoms. In 20 of the 23 patients the symptom which occasioned the summoning of the eye specialist was diplopia or, in a few cases, dimmed vision or flickering before the eyes. Double vision was constant or periodic in most cases. Paresis of the eye muscles was found in only 10 of the 20 patients who complained of double vision or dimmed vision. In 3 patients diplopia was one of the primary symptoms; in most of the others the eye symptoms appeared between the fourth and the eleventh day. All the ocular symptoms disappear completely or almost completely without special treatment in patients who survive the disease.

Hygiea

Experiences with Regard to Reconstruction Surgery from Study Trip in United States. E. Severin.—p. 2649.

Pneumothorax in Exudative Pleurisy.—Of 143 patients with primary exudative pleurisy observed for from one to five years after treatment 132 are well, in 11 (7.7 per cent) pulmonary tuberculosis developed and 4 (2.8 per cent) have died. Study of the 11 cases, Jervell and Istre assert, shows that in the 8 pneumothorax would have been useless, while in 3 it might perhaps have been of value. They conclude that systematic pneumothorax treatment in their material would not have been justifiable.

Primary Exudative Pleurisy.—Tuberculosis developed in 17 of 138 patients with primary exudative pleurisy treated in Drammen Hospital from 1935 to 1944, with 7 deaths. Nilsen says that both morbidity and mortality from tuberculosis after pleurisy seem at present to be considerably lower than reported earlier in the literautre. Most of the cases of tuberculosis and deaths from tuberculosis occurred in the years immediately after the pleurisy. Pulmonary tuberculosis was equally frequent on the side affected by the pleurisy and the opposite side. Morbidity and mortality were greater after bilateral than after unilateral pleurisy. In cases with demonstrable pulmonary infiltration or hilus adenitis the morbidity was quadrupled, in the cases with demonstrable infiltration the mortality likewise. Early drainage of the exudate with replacement of the exudate by air apparently reduces morbidity and mortality and may prevent shrinkage. It seems rational to treat by continued pneumothorax all cases of pleurisy with infiltration on the pleurisy side and those with tubercle bacilli in the sputum without demonstrable infiltration on the opposite side.

Cirrhosis of Liver and Its Relation to Acute Epidemic Hepatitis.—Wang found fully developed cirrhosis of the liver in 447 cases out of 18,952 necropsies from 1929 to 1945. Fifty-two cases followed hepatitis, 10 after an interval, 42 directly. In the latter the cirrhosis is attributed to the hepatitis. While during the first fifteen years the disease occurred in 10 men and 12 women, in the last two years 3 men and 17 women were affected, with incredibly rapid development of the symptoms of cirrhosis. The increased incidence of cirrhosis of the liver due to hepatitis and the preference for women also reported from Denmark are unexplained.

Book Notices

Synopsis of Physiology. By Rolland J. Main, Ph.D., Professor of Physiology, Medical College of Virginia, Richmond. Fabrikoid. Price, $3.50. Pp. 341, with 21 illustrations. C. V. Mosby Company, 3207 Washington Blvd., St. Louis 3, 1946.

No better review of Professor Main's brief textbook can be offered than the first paragraph of his preface: "Physicians and senior medical students often ask me to recommend a physiology text for review purposes, or to learn what has been added to our knowledge of physiology since they studied the subject. When, with yearly increasing exertion, I lift a standard text from my desk, they recoil in horror at its size, stating emphatically that they want a *little* book which hits the high spots. So here is a small book which attempts to cover the essentials." The book seems to accomplish its author's purpose. Here is a practical work for the reader who is determined to cover the field of physiology in the least possible time, who requires each bit of information to be catalogued as either known, unknown or speculative. No words are wasted; there are no eponyms, no references to original publications, and only twenty-one illustrations to detract from what the author calls a "shockingly dogmatic" approach to the subject. The textbook is not intended for use of students who seek to master the science of physiology, with its broad historical and experimental traditions.

Medical Biochemistry. By Mark R. Everett, Ph.D., Professor of Biochemistry, University of Oklahoma School of Medicine, Oklahoma City, Oklahoma Second edition. Cloth. Price, $7. Pp. 767, with 106 tables. Paul B Hoeber, Inc., 49 E. 33d St., New York 16; 90 Great Russell St., London W. C. 1, 1946.

The author has closely adhered to the same general principles he set up for the preparation of the first edition, namely to present a straightforward systematic outline of the fundamentals of biochemistry without the aid of the historical approach, thus omitting names and references and saving considerable space. While some will question whether this is the most interesting or best method of approach, they must admit that the author has presented a surprisingly large number of facts in a logical, accurate and scholarly manner. In a further effort at simplification, discussions of the various secretions (aside from the digestive secretions) and tissues are given under suitable subheadings in other chapters.

The subject is presented in ten chapters, on acid-base relations, colloids, enzymes and oxidation, digestion, lipids, carbohydrates, proteins, prosthetic radicals of nucleoproteins and chromoproteins, inorganic substances, vitamins and avitaminoses, and hormones and endocrinoses. The order in which the chapter discussions are taken up is chemistry, metabolism, pathology—the logical order of thought for the future physician. While there are those who believe that biochemistry should be presented to the medical student as a pure science, interpretations being given later in the curriculum, the author's sequence of discussion shows the medical student the practical importance of biochemistry while he has an opportunity of acquiring the necessary fundamental knowledge and thus stimulates his interest in biochemistry. For those students who desire further information, bibliographies of selected modern reviews covering the theoretical and practical aspects of the different topics follow each chapter.

Despite its comparatively small size, the book gives some attention to practically all topics of fundamental importance in biochemistry and clinical biochemistry as well. The criticism might be made that in the author's efforts to cover the subject completely in this small compass the brevity might mislead some students to underappreciate the numerous fundamental facts presented.

The book appears to be relatively free from errors of fact and type, for which the author and publisher should be commended. It will be found a reliable textbook for medical students and a valuable review for students who have employed other textbooks. Medical graduates who wish to reappraise their knowledge of biochemistry and clinical biochemistry also will find the book useful.

Les ultravirus des maladies animales: Nature des ultravirus, immunité, méthodes physiques et chimiques, virus des maladies animales. Par C. Levaditi, P. Lépine et J. Verge. En collaboration avec J. Bailly, et al. Fabrikoid. Pp. 1,226, with 202 illustrations. Librairie Maloine, 27 rue de l'Ecole-de-Médecine, Paris 6^e, 1943.

This volume, composed and published during the war, bears ample testimony to the remarkable intellectual capacity and productivity of the French under trying circumstances. There is need for a comprehensive treatise such as this on the virus diseases of animals. None exists in the English language, and the German "Handbuch der Virus Krankheiten," which appeared in 1939, is not well known. Under the editorship of Levaditi, Lépine and Verge, twenty-four specialists reflect in their respective chapters the continuous progress which has been made. Each author discusses his specialty; for example, J. Bailly writes on pseudorabies and G. M. Findlay on Rift Valley fever. For each disease included in the book there is a section which deals with history, geographic distribution, epidemiology, clinical and pathologic pictures, experimental infection, the infective viral agent, pathogenesis, immunity and immunization, and prophylaxis.

On the whole, this excellent and authoritative work includes within its scope only knowledge available up to 1941-1942. The first 239 pages consider the general characteristics and the nature of the viruses and the modern methodology employed in their study. Particularly interesting are the discussions on the use of the electron microscope. This section is well illustrated with photographs from the articles of Ruska. These articles, which appeared in German publications in 1939 and 1941, are not readily available in the United States.

According to Lépine, who reviews the present knowledge on the mechanism of immunity in virus infections, the refractory state to a reinfection is entirely cellular in nature. The deciding influence of antibodies at the port of entry and their role in such infections as yellow fever, encephalomyelitis and influenza are unfortunately not discussed. Although he hesitates to generalize in his opinion, Lépine does not correlate the enduring immunity which follows certain virus infections with the persistence of the virus in the host tissues. However, in this connection the role of carriers and the importance of latent infections in general were overlooked. One would like to know the biologic significance attached to the persistence of the hog cholera virus in the blood of goats for forty-two days (p. 593). In addition, a brief discussion of the virus infections transmissible to man, if readily available in such a volume, would be invaluable to the physician.

A cursory reading of the descriptions of 28 virus infections of animals discloses a number of interesting facts. The virus of foot and mouth disease is claimed to be present occasionally in the intestinal tract of a healthy human being. Contagious ecthyma of sheep and pox of goats have been transmitted to man. Pseudorabies may induce a mild human infection. The importance of the encephalitis agents of horses, sheep and cattle in producing human disease is fully described. The experimental transmission of the dog distemper virus to man is stated to produce an inapparent infection. According to recent accounts, human beings are resistant against the virus of infectious anemia of horses.

Especially interesting to the laboratory worker are the sections which deal with the virus infections of small animals, in particular the guinea pig and the rabbit. The role of viruses in the formation of tumors of rabbits and chickens and in the transmissible leukosis of birds is fully discussed. Other chapters deal with pleuropneumonia infections in goats and cattle and the viruses responsible for diseases of insects. These and all of the other chapters are concise and informative and are provided with selected bibliographies in footnote form. For quick orientation the chapter on rickettsia infections in dogs, sheep and particularly in cattle deserves consideration in view of the increasing importance of these animals as a possible source of Q fever in man.

The size and format of the book are convenient. The illustrations as a whole are excellent. It is an indispensable reference work and will serve as an excellent supplement to the companion volume, Les ultravirus des maladies humaines, by Levaditi and Lépine (1938).

Following repeated transfusions of blood of subgroups A_1 or A_1B to recipients of subgroups A_2 or A_2B, or vice versa, sensitization may develop and further transfusion of blood of the incompatible subgroup may cause a hemolytic transfusion reaction.

If donor and recipient are Rh positive, sensitization may occur if the Rh types of the two differ. The Rh factor is not a homogeneous single substance. It consists of several qualitatively differing types.

Tests for the Rh antibody in the blood of the recipient may prove sensitization.

The best way to prevent hemolytic reactions due to incompatibility after repeated transfusions is to test for the Rh factor and to give only Rh-negative blood to Rh-negative recipients. Another precaution is to do crossmatching tests with the serum of the recipient and the red cells of the donor according to a technic similar to the one that is used for Rh testing: place a few drops of the donor's red cell suspension in a narrow test tube, centrifuge, discard supernatant saline, add one to two drops of the recipient's serum, shake and incubate for thirty to sixty minutes at 37 C. in a water bath or incubator. If negative centrifuge for one minute at about 500 to 600 revolutions. Shake gently, read and check with microscope. Include control with recipient's own cells. Absence of clumping, if confirmed microscopically, suggests strongly that there is no incompatibility.

Reducing the speed of the transfusion will help to prevent untoward reactions.

TREATMENT OF GONORRHEA

To the Editor:—What is the best treatment of gonorrheal urethritis in men (new infections) with especial emphasis on the following points: 1. What is the total dosage of penicillin employed? 2. Is antecedent or concurrent sulfadiazine therapy helpful as a synergist and will it increase the percentage of "cures"? 3. What is the proper interval between injections of penicillin (single injection of penicillin in beeswax and oil as compared with the hourly injection technic reported by Heller of the U. S. Public Health Service)? 4. How many negative smears and/or cultures are advisable to insure that the patient is not capable of transmitting infection?

M.D., California.

Answer.—Gonorrheal urethritis in men responds well to intramuscular injections of 25,000 units of penicillin every three hours for eight injections. For office treatments 50,000 intramuscular units every two or three hours for four to six injections will cure 90 per cent of acute gonorrhea. About 10 to 13 per cent of gonorrhea is now resistant to penicillin, the percentage of failures increasing with inadequate dosages. Penicillin resistant gonorrhea should be treated with oral sulfathiazole or sulfadiazine 1 Gm. every four hours night and day to a total dosage of 30 Gm. Synergistic action of sulfonamides and penicillin occurs in some instances. Penicillin in beeswax is effective in many cases, but the therapeutic effect is slowed and becomes less positive. Beeswax penicillin is useful when interval injections are not practical.

Except in penicillin resistant gonorrhea, previous unsuccessful sulfonamide treatment does not preclude a favorable penicillin therapeutic cure.

The cessation of the urethral discharge, the subsidence of urinary symptoms and a clear morning urine without shreds are excellent indicators of a clinical cure. Following treatment, three consecutive negative smears and/or cultures of the urinary secretions at weekly intervals are extremely helpful to determine a bacteriologic cure. A persistent urethral discharge following treatment, in the absence of a stricture, is a common sign of a treatment failure.

SEX HORMONES FOR CARCINOMA

To the Editor:—The administration of the opposite sex hormone is an accepted procedure to help to arrest the progression of carcinoma of the prostate. Are the sex hormones of the opposite sex of value in the treatment of retroperitoneal sarcoma, bone sarcoma, lymphoma, Hodgkin's disease, carcinoma of the colon, bronchogenic carcinoma or carcinoma of any organ other than the reproductive organs?

M.D., Florida.

Answer.—Sex hormones of the opposite sex are not of value in the treatment of the tumors described in the query or of carcinoma of any organ other than the reproductive systems. Treating carcinomas of the reproductive organs by hormones of the opposite sex is at the very best of temporary benefit, and their efficacy is questionable. Treatment of carcinomas of the sex organs with opposite sex hormones should not prevent the use of adequate surgery or irradiation, which are methods of proved value.

TRAUMA AND TEAR OF LESSER OMENTUM

To the Editor:—I wish to record an unusual case. On Oct. 7, 1946 I performed an exploratory laparotomy on a married woman aged 22, who complained of severe abdominal cramps and vomiting of sixteen hours' duration. The patient weighed 110 pounds (50 Kg.), her temperature was 97.6 F., her pulse 68 to 84 and her blood pressure 100/60. The findings were those of an acute condition of the abdomen. When the peritoneum was incised a large amount of fresh blood and numerous clots were evacuated. With considerable difficulty the bleeding finally was found to be coming from a 6 cm. vertical tear in the center of the gastrohepatic ligament (lesser omentum). Closure of the tear controlled the hemorrhage. Approximately 1,000 cc. of blood was lost. This was the only pathologic finding in the abdomen. The patient made an uneventful recovery. There was no history of any trauma except for lifting a heavy tub of wash water forty-eight hours previous to the onset of pain. Are any cases recorded of injury or tear of the gastrohepatic ligament, caused either by indirect trauma or spontaneously? What is the explanation of the unusual feature of a slow pulse preoperatively in spite of hemorrhage and shock?

K. L. Jenkins, M.D., Marysvale, Utah.

Answer.—The case described in the query is unique. The factor of trauma, though somewhat questionable, is still the most likely explanation of the phenomenon. A search of the extant medical literature fails to reveal any analogous case in which a tear of the lesser omentum occurred as a result of spontaneous effort or trauma of a direct blow. The proximity of the common bile duct and portal vein in the free edge of the gastrohepatic ligament would subject them to injury were such an occurrence as a tear from spontaneous effort a common event. During the war direct injury to the lesser omentum from stabs, bullet wounds and shrapnel and grenade bursts were encountered frequently and easily controlled.

Such a physical effort as the lifting of a heavy tub of water is recognized as a traumatic factor in initiating both hemorrhage and/or perforation of a peptic ulcer in the same anatomic region. It is plausible to believe that a similar violent exertion in a woman weighing only 110 pounds might initiate a tear in a mesentery, leading to extensive intra-abdominal hemorrhage.

The slow pulse indicates the absence of shock, owing to the fact that the hemorrhage, though considerable, took place slowly over a forty-eight hour period.

EMPYEMA AFTER LOBECTOMY

To the Editor:—Will you please let me know if empyema occurs after lobectomy for pulmonary bronchiectasis? If it does occur, in about what percentage of lobectomies does empyema develop?

M.D., New York.

Answer.—With the present lobectomy technic of individual ligation of the blood vessels, interrupted fine sutures of the bronchial stump, and the routine use of penicillin, the postoperative incidence of empyema is only about 5 per cent. When empyema occurs it is almost always due to the failure of the remaining lobe or lobes to come into early contact with all parts of the parietal pleura when pathogenic organisms are present. Such failure is usually due to (1) occlusion of the water-seal drainage system that is often used for a day or so in order to empty the pleural cavity of air and pleural effusion, (2) the development of a bronchopleural fistula at the lobectomy stump or from the pulmonary parenchyma that must be transected when an interlobar fissure is incomplete or (3) atelectasis resulting from bronchial occlusion by secretions.

PHYSICAL ACTIVITY AFTER SPONTANEOUS PNEUMOTHORAX

To the Editor:—How long should a patient who had a spontaneous pneumothorax from a ruptured emphysematous bleb be kept from his usual duties as a railroad brakeman after complete reexpansion of the lung?

R. L. Donald, M.D., Meridian, Miss.

Answer.—One month's rest after complete pulmonary expansion should permit the formation of as firm pleural adhesions as would develop during a longer period of rest. However, there is a strong tendency for spontaneous pneumothorax to recur if there has been insufficient obliteration of the pleural cavity by adhesions, the extent of the obliteration depending on the extent and degree of pleuritis that may have been present. Recurrence of a spontaneous pneumothorax is more likely to take place in persons who lead a strenuous life than a sedentary one. If repeated recurrences take place or if the lung fails to expand within a month or two after collapse has occurred, temporary phrenic nerve paralysis, thoracoscopic division of isolated pleural adhesions that may be holding open a bronchopleural fistula, surgical resection of the fistulous area of the lung or the artificial production of pleuritis by pleural poudrage or the interpleural injection of certain solutions should be considered, the method to be chosen depending on the condition of the particular patient.

THE USE OF ISOTOPES IN MEDICAL RESEARCH

J. H. LAWRENCE, M D., D.Sc
Donner Laboratory of Medical Physics
Berkeley, Calif.

The word isotope refers to forms of the same element having different atomic weights. For example, there are five isotopes of ordinary iron in nature, and a preparation of iron used therapeutically contains these different isotopes in the following percentages:

Fe^{54}	6 04%	Fe^{57}	2 11%
Fe^{56}	91 57%	Fe^{58}	0 28%

All have the same nuclear charge, which means that they are iron, but each has a different total atomic weight. Similarly, other elements have different isotopic forms. For instance, there is hydrogen, with atomic weight 1; and heavy hydrogen, with atomic weight 2, which is twice as heavy. Hydrogen in nature contains 99.98 per cent H^1 and 0.02 per cent H^2. Other examples are nitrogen, with two isotopes, N^{14} (99.62 per cent), and N^{15} (0.38 per cent) and carbon, with two isotopes C^{12} (98.9 per cent) and C^{13} (1.1 per cent). In a given chemical or biologic sample, the percentage of these isotopes in the material can be determined by use of the mass spectrograph; and by employing compounds containing enriched percentages of a particular isotope, one can trace an element or compounds of that element in a biologic process. In the mass spectrograph the ionized atoms of different weights are accelerated in a magnetic field, which causes them to travel in a circular path, the radius of which depends on the mass of the particular particle. The collecting plate accumulates the charges brought to it, and the amount of the particular isotope is determined from this value. Important and extensive biologic, biochemical and medical research have been done with this tracer technic, particularly with N^{15} and C^{13}.[1]

There is another type of isotope, which I would like to discuss in somewhat more detail. This is the radioactive isotope. In addition to having different atomic weights, these isotopes emit rays of various types, somewhat like the rays emitted by radium and its decay products. The quantity of the isotope present can be determined by use of a Geiger counter, electroscope or electrometer, which count or measure the number of rays emitted per unit time. With methods now available radioactive forms of nearly all the ninety-six elements now known in the periodic system can be made artificially. The most efficient methods involve the use of the cyclotron or the uranium pile.[2]

In the cyclotron positively charged nuclear particles are accelerated. For example, if radioactive iodine is to be made, a target of the element tellurium (which is next to iodine in the periodic table) may be bombarded with deuterons. The result is the transformation of some of the tellurium atoms into I^{131}, a radioactive isotope which emits beta and gamma rays. The reaction may be written as follows:

$$ {}_{52}Te^{130} + {}_{1}H^{2} \longrightarrow {}_{53}I^{131} + {}_{0}n^{1} $$

tellurium + deuteron ⟶ iodine (radioactive) + neutron

Some of the transmutations that can be effected with the cyclotron may also be produced by the pile, and in many of these cases the pile is able to make larger quantities of isotope than is the cyclotron. For example, ordinary N^{14} can be converted into long-lived radioactive C^{14}. The reaction is as follows:

$$ {}_{7}N^{14} + {}_{0}n^{1} \longrightarrow {}_{6}C^{14} + {}_{1}H^{1} $$

Here, the target is nitrogen in the form of some compound of nitrogen, such as ammonium nitrate. The bombarding bullet is a slow neutron, and a pile is the source par excellence for slow neutrons. The nitrogen nucleus gains a neutron but loses a proton and thus is transformed to carbon of atomic weight 14.

There are two obvious uses for these new isotopes: one as a source of therapeutic irradiation in substitution for roentgen rays and radium and the other as tracers in metabolic studies. These elements and compounds made from them or containing them are chemically like their inactive relatives. Since they emit rays, they can be followed in the organism and a dynamic picture of metabolism can be obtained. Only one in several million atoms need be labeled with activity to enable all of them, including the nonactive atoms, to be followed.

In tracer work extremely weak activities of the elements are used so that there is no biologic effect from the irradiation. There is a so-called safe human tolerance level for irradiation (0.1 roentgen per day), and in tracer work one attempts to keep below this level. In their every day environment all persons are exposed, from cosmic rays and the radiations from the naturally occurring radioactive substances in the earth, to a small daily dose of irradiation. In therapeutic work, in contrast to tracer work, larger doses are used.

From the Division of Medical Physics (Radiation Laboratory and Department of Physics) and the Division of Medicine, University of California

This paper is abstracted from the second annual Alumni Lectures, University of Tennessee College of Medicine, 1946, and from a paper read in the General Scientific Meetings at the Ninety Fifth Annual Session of the American Medical Association, San Francisco, July 2, 1946

Availability of Radioactive Isotopes: Announcement from Headquarters, Manhattan Project, Washington, D. C., Science **103:** 697-705 (June 14) 1946.

In figure 1 are listed a number of radioactive isotopes which have been used in biologic and medical research. As with all unstable atoms, each isotope emits a characteristic type of radiation and has a definite half-life. The half-life is the time required for the sample to decay to one-half its original activity. There is H^3, radioactive hydrogen, which has a half-life of 31 years. There are two medically useful [3] radioactive isotopes of carbon, C^{11} and C^{14}, the former with a half-life of about twenty-one minutes and the latter with one of about 6,000 years. The former has been used in medical studies [3] in which experiments must be completed within a few hours because of the rapid loss of activity. With carbon of atomic weight 14 there is no appreciable decay during a human lifetime. Farther down the list are seen two isotopes of sodium, and one of phosphorus, also one of sulfur, calcium, iron, iodine and potassium—all with different half-lives and all of interest in physiology and medicine. The last few elements are those which occur in nature, as does radium. It has a half-life of almost 1,600 years. Another interesting natural radioactive element is uranium 235, which has a half-life of almost a billion years and is used in one of the atomic bombs. Element 94 is plutonium, which is made artificially from uranium (although it occurs in minute amounts in nature); it is the essential ingredient of another type of atomic bomb.

Fig. 1.—Partially complete list of artificial and natural radioactive elements. Radiation symbols are: β^- or β^+, negative or positive electrons emitted from the nucleus; γ, gamma rays; e^-, internal conversion electron; *k*, x-ray, and *I.T.*, isomeric transition.

In the consideration of the applications of these elements in research problems, first, examples can be given of several technics which have been developed. With the autoradiographic technic the animal or plant may be given a single dose of the tracer material, and at various periods thereafter tissues are sectioned and placed against photographic film for short periods of time. Then the film is developed. Figure 2 shows how one can visually demonstrate the location of a gas in the tissues. Here, a thin, frozen cross section of a rat has been placed against a film after the rat has been breathing a mixture of oxygen and radioactive krypton. This latter gas, like nitrogen, is quite soluble in fat, and the autoradiograph shows that the spinal cord and perirenal fat have taken up relatively large amounts of the gas. In the case of the cord the high uptake is presumably related to phospholipid content. The white area around the cord represents a cross section of a vertebra. Here, there has been no uptake of the gas.[4] Two other radioactive isotopes have been used in some interesting autoradiographic studies by Axelrod and Hamilton.[5] They obtained mustard gas which contained radioactive sulfur in its structure and lewisite gas which contained radioactive arsenic. These labeled gases were painted on a small area of normal skin, sufficient to cause vesication, and then a biopsy specimen of the skin was taken. Sections were made and autoradiographed. Comparative studies of the stained sections and the autoradiographs revealed that, although both gases are deposited in the skin, mustard was chiefly in the corium while lewisite was seen more in the epidermis and hair follicles.[5]

The second and most widely used technic is the in vitro method. In this case samples of material, such as blood, spinal fluid, urine, stools or tissues, taken at various periods of time after administration of the radioactive material are weighed, ashed and measured for activity. Perhaps the most interesting work with this technic has been that of several groups of investigators using radioactive iron in studies on the absorption of different compounds of iron by various routes and on methods for the preservation of whole blood. The development of the whole blood preservative, anticoagulant acid citrate dextrose solution (ACD), was greatly facilitated by the use of red cells labeled with radioactive iron;[6] and it has been shown that ferrous iron given therapeutically is more completely absorbed than the ferric form.[7] Figure 3 shows the use of the second technic in some studies on mice in which the objective was to determine the tracer dose versus the biologically destructive dose of radioactive phosphorus.[8] Tissues taken after killing each animal were weighed and extracted for various phosphorus-containing fractions, and the extracts were measured for activity. Curves for the synthesis of various compounds containing phosphorus were obtained. These showed the inhibition of synthesis by the larger dose of P^{32} used.

This report may be obtained by writing to the Office of the Publication Board, Department of Commerce, Washington 25, D. C.

The final technic is the in vivo method, in which the counter measures the uptake at local areas of the body. For instance, one can pass the counter tube over the surface of an animal that has received a radioactive compound localizing in a certain viscus, tumor or gland and note an increase in counting rate when the particular tissue is approached. Similarly, this technic has been used to measure the time required for the blood in a normal person to reach the heart from the arm after the injection into the antecubital vein of a small amount of radioactive sodium chloride in isotonic solution.

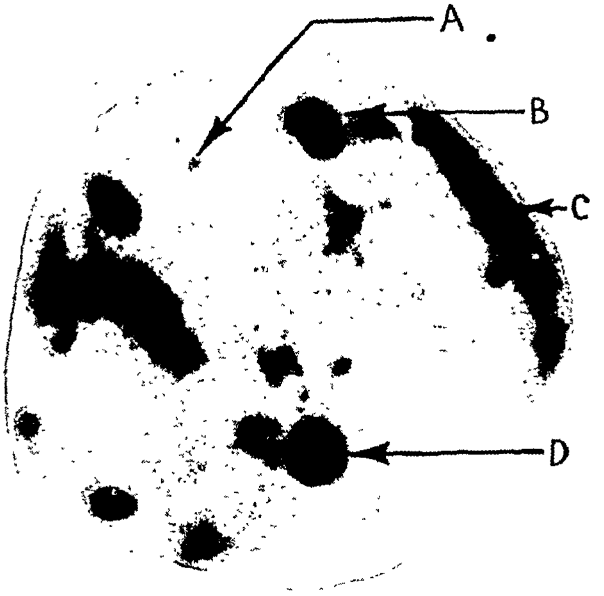

Fig. 2.—Autoradiograph showing localization of the isotope in cross section of rat previously exposed to atmosphere containing radioactive krypton. *A*, spinal cord; *B*, perirenal fat; *C*, gas trapped in hair, and *D*, mesenteric fat.

Again, thyroid metabolism has been studied subsequent to the administration of radioactive iodine: the counter tube is placed over the gland, and the uptake curve is determined and found to vary for different types of thyroid abnormality.[9] Circulation to the extremities may be studied by using intravenously injected radioactive sodium chloride or by inhaling one of the radioactive gases (figs. 4 and 5).[10] This technic is now finding use in association with skin temperature measurements in studies of vascular disease. The adequacy of the circulation can be estimated by this technic, and therapeutic measures can be evaluated. Figure 7 shows how one can measure the uptake and movement of a labeled compound in mouse tumors by the in vivo technic, as developed by Strajman.[11] The Geiger counter tube is long and narrow and can be inserted into the rectum or vagina for similar studies. One final example is shown in some recent investigations with carbon of atomic weight 11, the twenty-one minute half-life isotope.[3] The problem presented by the Navy was this. Why, after the inhalation of a definite amount of carbon monoxide, is it possible to recover only 60 per cent of it during the early periods after inhalation?[12] Is this unrecoverable carbon monoxide oxidized to carbon dioxide by the body, or does it go somewhere other than to hemoglobin? To answer this question radioactive carbon monoxide was employed, mixing it with ordinary carbon monoxide (150 cc. in 1,000 cc. of oxygen) in a Douglas bag. After inhalation the carboxyhemoglobin level of the subjects was raised significantly. While breathing oxygen all exhaled carbon dioxide was collected in soda lime and measured for radioactivity. There was no activity in any of the soda lime; hence, it was proved that the body does not oxidize carbon monoxide to form carbon dioxide. What had happened to the carbon monoxide? Counters were then placed over various parts of the body, and

figure 6 presents the rate of disappearance of carbon monoxide from the thigh and from the liver as meaured by a counter placed over these areas. The thigh disappearance rate corresponded to the disappearance rate of carbon monoxide from samples of blood taken from the antecubital vein; this was expected. But the other curve is the interesting one, that is, the curve obtained with the counter placed over the liver. It starts high and only gradually approaches the slope of the thigh curve, indicating that the liver has possibly "gobbled up" a large fraction of the carbon monoxide, as the blood carries a large amount through it, later releasing the carbon monoxide to the blood stream, from which it is eliminated by the lungs. Later experiments, in which all exhaled air was collected for several hours in 3 subjects, showed that nearly 100 per cent of all carbon monoxide taken from the Douglas bag was eventually recovered in the exhaled breath;[12] thus the liver eventually releases its carbon monoxide. These results, from the clinical point of view, throw further doubt on the reliability of using carbon monoxide for blood volume determinations, whether the retention of carbon monoxide by the liver is due to "gobbling" or to a circulatory phenomenon.

Finally, the selective localization of certain compounds or elements in tissues has led to some therapeutic applications of the artificially made radioactive isotopes. The thyroid gland selectively absorbs iodine and constitutes the best example of selective localization. Actually the concentration of the iodine atoms in the gland may be several hundred times that in any of the other normal tissues, and Hamilton and Soley and their associates have shown that it is possible with larger doses in rabbits to remove their thyroid glands by this slow selective irradiation without damage to other normal tissues.[9] These and other studies have led to the successful use of radioactive iodine in the therapy of hyperplastic thyroid disease by several groups of investigators.[13] It has been found that certain cases of cancer of the thyroid concentrate radioactive iodine, and Marinelli and his associates[14] have successfully treated a patient with carcinoma of the thyroid, which had metastasized to bone, through the use of radioactive iodine. The patient was extremely ill, and emaciated but now, after three years, has gained weight, is up and around and enjoying normal life. This demonstrates what can be done through selective localization and irradiation.

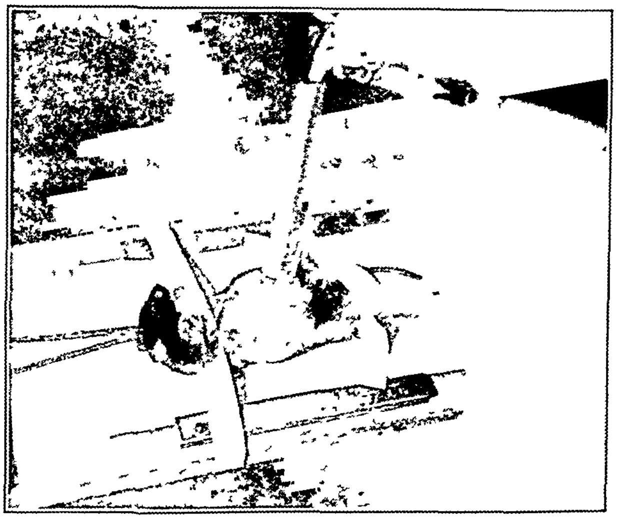

Fig 7—Small Geiger counter for in vivo study of metabolism of labeled elements or compounds.[11]

Figure 8 again shows selective localization, this time of a colloidal radioactive compound first used by Jones, Wrobel and Lyons in the liver and spleen, and this is clearly seen by comparing the section and the autoradiograph.[15] There is clouding of the film *only* in the regions of the liver and spleen. This, again, is genuine selective localization. The therapeutic use of isotopes is based on such selective localization.

Since 1936,[16] radioactive phosphorus in the form of sodium hydrogen phosphate has been used in the treatment of chronic leukemia and polycythemia vera. The use of radioactive phosphorus (P^{32}) in these diseases is based on the fact that in leukemic tissue and in the bone marrow there is some degree of selective localization; therefore, selective irradiation is the result. However, the degree of selective irradiation is not great, and the irradiation delivered to the abnormal tissues with reference to the normal tissues is not so great as would be desirable. The limitations of this form of therapy, particularly in the case of leukemia, has been brought out in a recent article.[17] In evaluating any new form of therapy the questions every one asks are "Does the treatment cure the disease?" and "Is comfortable life prolonged?" In the use of radioactive phosphorus for leukemia several groups of investigators have demonstrated that remissions can be produced without any complicating radiation sickness.[18] All reports have expressed the belief that this form of therapy is as good as, and possibly better than, roentgen radiation, but none has answered the preceding questions. Its one definite advantage is the lack of irradiation sickness. Another five years at least must elapse before the final evaluation can be made of any large series with reference to length of life after onset, but in a forthcoming paper there will be a preliminary detailed analysis of such a large series.[19] In this work the use of radioactive phosphorus (P^{32}) was considered to be a form of whole-body spray therapy with some slight localization in the leukemic tissue. Consequently, when spray therapy was not considered to be needed and when it was believed that local roentgen radiation to the spleen, liver and lymph nodes was indicated, such local therapy was given, but usually after a course of P^{32} had been administered. However, in the whole group many patients were treated with this isotope alone. Other supportive measures, such as transfusions and the administration of iron and liver preparations, were used as indicated. In other words, all patients in this series were not treated with radioactive phosphorus alone. Some of them received local roentgen radiation in addition. The patients were not selected, and all those treated from the very beginning have been included. As a group, these patients are apparently not representative of those with average chronic leukemia but are an unfavorable group, since many of them were failing to respond to standard methods of therapy and then were referred to us.[19] Of this latter impression one cannot be certain, however.

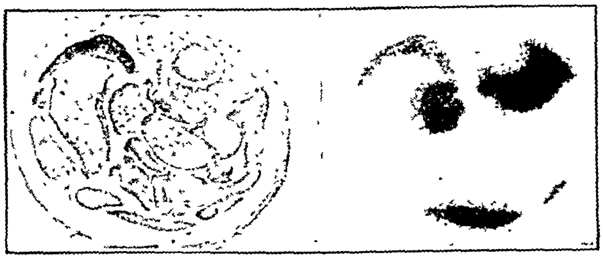

Fig. 8.—Cross section of mouse showing selective localization of chromic radioactive phosphate in the liver and spleen.

Figure 9 presents the results in the first 98 cases of chronic myelogenous leukemia. The duration of life is from the time of onset until death. The time of onset was determined from the appearance of the first symptom or sign that could definitely be related to the leukemic process, as proved either at the time or a short time later. In the determination of this time of onset, an effort was made to err on the side of favoring a short duration. All the patients have been seen by at least three physicians in the clinic. A glance at figure 9 shows that radioactive phosphorus (P^{32}) is far from the answer to the problem of chronic myelogenous leukemia, but the average length of life compares favorably with other reported series, and some of the patients are still living.[20] The 2 patients living at 8-9 years and 10-11 years have been treated with radioactive phosphorus only. Thus, this preliminary analysis shows that in addition to the other advantages of treatment

with radioactive phosphorus previously discussed by numerous writers, the length of life after onset is as long as that after other methods of therapy and may prove

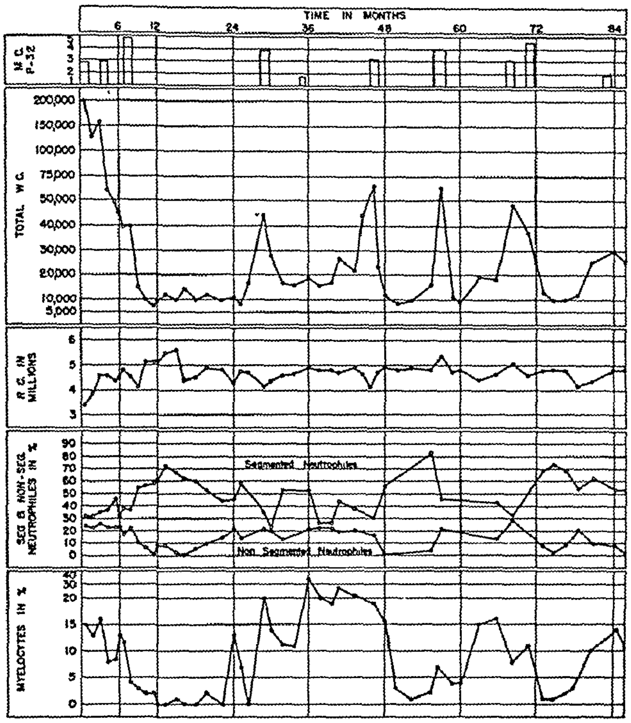

Fig. 11.—An unusual response to P^{32}. This patient, C. K., a man now 35 years of age, has continued for over eight years to respond to infrequently administered radioactive phosphorus. He has never received roentgen radiation or other forms of therapy for chronic myelogenous leukemia.

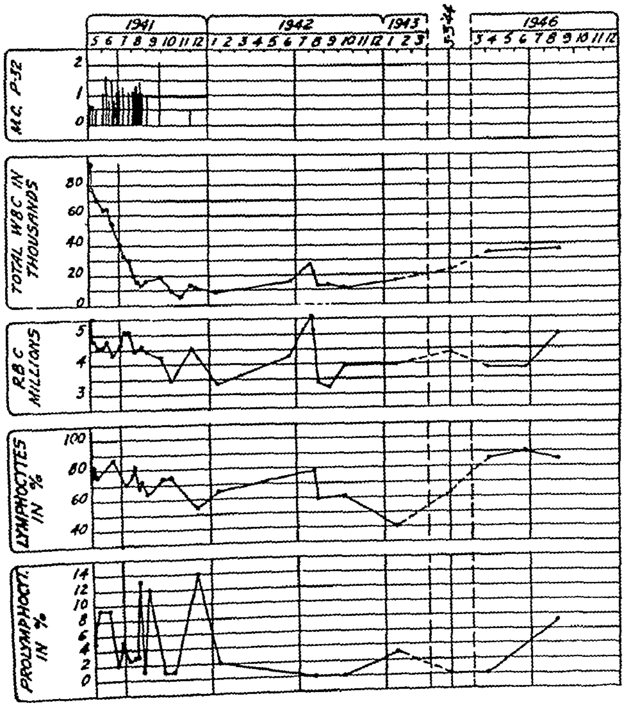

Fig 12.—Hematologic response during fifty-one months of intermittent radioactive phosphorus therapy in patient M. P., a woman aged 59, with chronic lymphatic leukemia. This patient has had no treatment since 1941.

to be somewhat longer. The typical reaction to this therapy and an unusual reaction to therapy are shown in figures 10 and 11.

In figure 13 are summarized the results in chronic lymphatic leukemia. Here, the series is smaller and the statistics are less valuable. Also, 2 patients who had the disease for several years prior to treatment with P^{32} are in the group, and they raise the figure for the average length of life after onset. Nevertheless, the results are good according to present criteria for the evaluation of the treatment of chronic lymphatic leukemia by standard methods.[21] Figure 12 shows the reaction to P^{32} in 1 patient with lymphatic leukemia. From ten years of experience in the use of radioactive phosphorus in chronic leukemia the impression has been gained that if radioactive compounds can be made to localize more selectively in leukemic tissue improved results from radiation therapy may follow. Some of the radioactive colloids have possibilities in this direction and are now under trial.

In forthcoming publications therapeutic and other investigations of a large number of patients suffering from polycythemia vera will be discussed in detail. The first patients were treated in 1939,[16] and numerous investigators [22] have confirmed the fact that with radioactive phosphorus, administered in small doses and infrequently, it is usually possible to control the polycythemia and the symptoms which result from it. As shown in figures 14 and 15, repetition of therapy may not be necessary for many years after the first course of treatment. Other than complicating disease, the chief causes of death in polycythemia vera have been: leukemia; thromboses, such as portal, coronary or cerebral, and a terminal anemia in the spent phase of the disease. There may be other intercurrent disease, such as infections, arteriosclerotic complications or neoplasms, particularly in the older patients. During the period 1939 to 1946 74 patients with polycythemia vera have been treated with radioactive phosphorus. Some of these had been previously treated by venesection, phenylhydrazine or roentgen radiation. The average age at onset of first symptoms of the disease was 48 years. The life expectancy at age 48 is about twenty-four years.[23] Since the initiation of the use of radioactive phosphorus there have been 10 deaths in the whole group from various causes, at an average age of 69, which is not far from the normal life expectancy, i. e.,

[23] The Final Phase in the Conquest of Tuberculosis, Statist. Bull. Metrop. Life Insur. Co. no. 4 **26:** 1 (April) 1945.

twenty-one years instead of twenty-four years. The small number of cases, however, does not permit one to attach much significance to this figure; also several of the patients had previously been treated by methods other than the use of radioactive phosphorus. Perhaps one can hope that, in controlled polycythemia vera, a near-normal life expectancy may be reached. As has been pointed out previously, thromboses, leukemia and anemia are common complications of the disease, and the life expectancy in polycythemia is probably not over ten years on the average, although exhaustive search of the literature does not reveal the life expectancy in this disease, whether treated or untreated. In a series of 163 patients treated by other methods, 36 were reported to have lived longer than five years, and in about 17 per cent of the whole group there developed leukemia.[24] In the radioactive phosphorus series, 3 have died of leukemia. These were patients whose disease was of long standing and who had been treated previously with phenylhydrazine, roentgen radiation or venesection.

There is one other example of selective localization in therapy in which a radioactive element is being used. This is P^{32} in the treatment of skin cancer.[25] The localization is accomplished by soaking a piece of absorbent paper, such as blotting paper, with the desired amount of beta-ray-emitting radioactive phosphorus and applying it to the lesion for the calculated length of time. In this way the predetermined dose in roentgens of superficial irradiation is delivered during the following several hours or days; and since the beta rays penetrate less than 1 cm., most of the irradiation is delivered to the neoplastic cells and not to the deeper, uninvolved tissues.

In conclusion, these nonradioactive isotopes, such as N^{15} and C^{13}, and the radioactive ones provide the investigator with a valuable method for metabolic studies. There is a rich field of investigation with labeled hormones, antibodies, amino acids, antibiotics and other biologically important compounds, and our colleagues in the field of chemistry are now very active in this direction.[26] In the therapeutic field, if compounds containing radioactive elements emitting radiations which traverse only short distances and which localize to a high degree in neoplastic tissue can be found, important advances may be made. The localization of radioactive iodine in the hyperplastic thyroid is the best example of such localization at present. Recently much has been read of the atomic bomb and the uranium pile, and it is often inferred that these new developments are going to revolutionize medical research and even therapy and that the cancer problem soon may be solved with their aid. It is important, however, to keep in mind that there have been available from the cyclotron the various radioactive isotopes for biologic and medical research for over ten years; that is, since 1934. They have already facilitated numerous important contributions in medical investigation and will continue to do so; but one must not expect them suddenly to solve the cancer problem. In the development of the atomic bomb and the uranium pile most of the fundamental research which made the atomic bomb nearly a certainty in time had been carried out prior to 1939. In the case of the cancer problem this fundamental research has yet to be done. However, a continued stream of contributions can be expected now that isotopes will be widely available for experimental investigation. For animal studies and for certain clinical studies their careful use by competent workers is justified and indeed urgently indicated.

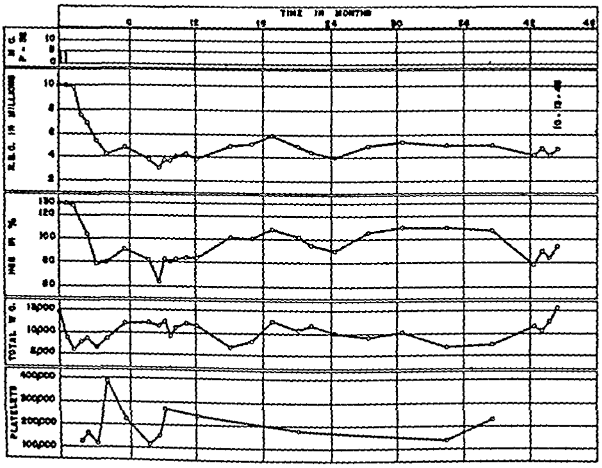

Fig. 14—Hematologic response to two injections of radioactive phosphorus. This patient, L J, a woman aged 36, with an enlarged spleen and typical polycythemia vera, which had not previously been treated, continues normal after five years, without further therapy

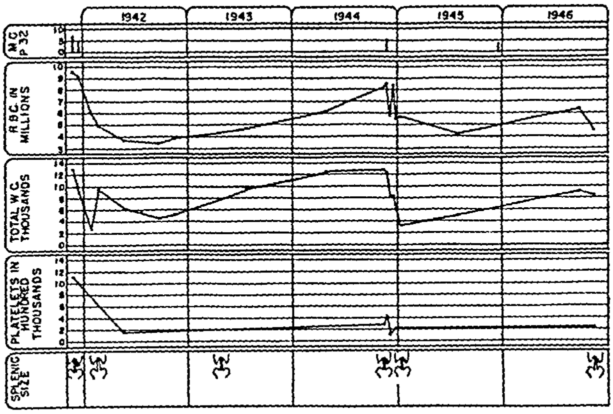

Fig 15—Patient M. J. M, a man aged 56, with polycythemia vera of one year's duration, treated in 1942, had a recurrence of symptoms and signs and was retreated in 1944.

ADDENDUM

It is assumed that physicians are aware that, as in the case of roentgen rays and radium, there are certain health hazards to both physician and patient when working with artificial radioactivity,[27] unless working conditions are carefully controlled, and unless dosage to the patient is also carefully controlled. Excessive dosage or long-continued administration of smaller doses may produce serious delayed effects. When individuals or groups begin to use these radioactive materials in the laboratory or clinic, it is important that they have the advice of and periodic checks by a physicist and a physician.

ROENTGENOLOGIC CONTRIBUTION TO THE DIAGNOSIS OF FUNCTIONAL INTESTINAL DISORDERS

HARRY M. WEBER, M.D.
Rochester, Minn.

The intestine is anatomically constructed and physiologically equipped to digest food and to eliminate waste. To accomplish these purposes it has three fundamental kinds of activity: secretion, absorption and motility. Intestinal function is the sum of these activities. For purposes of study and discussion it has been expedient to consider them separately as distinct intestinal energies. This analytic manner of thinking about and investigating intestinal function may have the advantage of clarity and directness in many of the problems connected with this function, but it is important to realize that these activities actually cannot be divorced in this way. They have an essential interdependence. In health they cooperate in a literal sense to effect what is called a "normal" or "healthy" intestinal function. In disease any maladjustment of or interference with one of the basic activities is associated with or may actually cause observable change in the performance of the other two.

The roentgen rays have given to medicine a method of observing the intestine of man and animal in action without having recourse to laparotomy. By introduction of substances into the intestinal tract which are opaque to the roentgen rays it is possible to observe how the intestine handles a bolus with the physical and chemical properties so acquired. With some reservations roentgenologists infer that the intestine handles food in a similar manner. The particular intestinal activity thus observed is its motility, that is, the mechanics of intestinal movement. Increase in intestinal secretory activity or decrease in intestinal absorptive activity or a combination of both are observable also, but only in a limited way and largely by inference again—chiefly by noting the presence of an excessive amount of intraluminal fluid and gas. Roentgenologic studies on the physiology of the intestine are usually concerned, however, with the phenomena of its movements. Since the basic intestinal activities are interrelated so intimately, deductions about the secretory and absorptive activities may often be made from observations on intestinal motility, and so the roentgenologic method has earned a prominent place among other methods of studying the physiology of the intestine in health and in disease.

The causes of intestinal dysfunction are as many and as different in origin and kind as are the factors which can adversely affect any one or all of the fundamental intestinal activities.

Constipation, diarrhea, colicky or cramplike abdominal pain, nausea, vomiting, abdominal noises and intestinal distention are symptoms which direct attention to the intestine. They have a mechanical connotation, and we tend to relate them to a derangement of transport of intestinal content. They are manifestations of intestinal malfunction, but not of its cause. Any etiologic type of intestinal dysfunction may be manifested clinically by symptoms of this kind, singly or in various combinations.

INTESTINAL DYSFUNCTION ASSOCIATED WITH DISEASE IN THE INTESTINE ITSELF

Pathologic structural alteration in the intestine that has reached macroscopic proportions can be expected to produce functional change of some degree, although the functional change may not be great enough to be noticed by the patient or detected by the physician even with the use of his most direct and revealing diagnostic instruments. Such structural change may be the result of a neoplastic or inflammatory process arising in the intestine itself, or it may be the result of an extension of similar lesions to the intestine from neighboring or contiguous viscera. Included in this category are those congenital or acquired anomalies of intestinal structure which become pathogenic only under certain circumstances, such as diverticula, anomalies of size, fixation and position and other structural intestinal defects. Intestinal dysfunction that develops as a result of any of these changes is said to have an organic basis.

The first and most important objective of the physician confronted with a patient who exhibits the clinical manifestations of deranged intestinal function is to exclude the existence of organic intestinal disease or pathogenic structural abnormality as the cause of the disorder. To do this effectively he turns to diagnostic procedures which can deliver positive or negative evidence that is direct and objective. If abnormality is suspected to exist in the rectum or the sigmoid colon, the proctosigmoidoscopic examination is done first. This examination has obvious and insuperable advantages over even the most competently performed roentgenologic examination in the investigation of these portions of the large intestine. It takes advantage of direct vision and contact, and so the structure and the color of the mucous membrane and the presence and the nature of exudates and secretions are immediately perceived, and material for bacterial culture and biopsy can be taken at once. For the portions of the intestinal tract above the reach of the proctosigmoidoscope, the small intestine included, the roentgenologic examination has become the most important and revealing diagnostic maneuver which the modern physician has at his disposal. It is a method which can be made to reveal the existence of pathologic structural change at least as early in its pathogenesis as it is able to manifest itself by clinical signs and symptoms. The phrase "can be made to reveal" is used advisedly, because it must be presumed that the appropriate maneuver is chosen, that it is conducted competently and that the patient is strong enough to stand the rigors of the particular examination that his problem demands. Obviously this ideal is not always realized even by the most competent roentgenologic diagnosticians, but when they fail they are inclined to impugn the personal factor and not the method. If I seem thus to overestimate the efficiency of the roentgenologic method in the diagnosis of structural intestinal change,

---

From the Section on Roentgenology, Mayo Clinic.

Read before the Section on Gastro-Enterology and Proctology at the Ninety-Fifth Annual Meeting of the American Medical Association, San Francisco, July 4, 1946.

it is chiefly because I wish to underline my conviction that the most important contribution roentgenologic diagnostic maneuvers make to the diagnosis of functional intestinal disorders is the efficient role which they play in the exclusion of organic intestinal disease as the cause of a given set of clinical manifestations of functional intestinal derangement.

It appears that advances in roentgenologic diagnosis in general, and in the field of gastroenterology in particular, have been closely linked with the development and definition of morphologic syndromes on which a pathologicoanatomic diagnosis can be constructed, to the exclusion, by and large, of roentgenologically observable physiologic changes caused by pathologic changes in structure. The original roentgenologic efforts in gastroenterologic diagnosis were concerned principally with the normal and abnormal physiology of the alimentary tract, from the oral cavity to the anus. The roentgenologic diagnostic syndrome of gastrointestinal disease that were developed then were essentially and almost exclusively physiologic. Today such roentgenologically observable changes in the intestinal tract as local or general hypermotility, hypomotility, hypertonus, hypotonus, spastic phenomena and changes in the secretory and absorptive activities that can be exhibited with the use of roentgen rays are made use of chiefly to stimulate an intensified search for a cause, and the cause is presumed to be organic, that is, structural, until proved otherwise. This is not to minimize their importance, but there are few, if any, roentgenologic syndromes of organic gastrointestinal disease in which the accompanying functional alterations have the necessary quality of definitiveness. This trend toward the morphologic is observed also in other fields of roentgenologic diagnosis. In urography, cholecystography, ventriculography, encephalography and myelography, lienography and hepatography, hysterography and salpingography, the purpose is always the same, the achievement of a basis for a pathologicoanatomic diagnosis, even when the roentgenologic test depends primarily on a preserved functional capacity of the organ under consideration, as is the case in cholecystography and intravenous urography. Roentgenologic diagnosticians are expected to elicit diagnostic data which will enable them to use the diagnostic language of the pathologists. This trend is not surprising, nor is it to be strenuously opposed, for the pathologist is usually the final arbiter in matters diagnostic, and his influence has elevated the plane of roentgenologic diagnostic efficiency immeasurably.

INTESTINAL DYSFUNCTION ASSOCIATED WITH EXTRAINTESTINAL DISEASE OR DYSFUNCTION

Disturbance in the physiologic activities of the intestine, sometimes of considerable magnitude, is also observed to exist in association with organic change in or functional derangement of adjacent or neighboring extraintestinal but intra-abdominal viscera, such as the stomach, the gallbladder, the pancreas, the liver and the genitourinary organs. Most of the time the clinical manifestations of intestinal dysfunction are obviously of little consequence, but there are times when they are prominent enough to obscure the clinical manifestations of the primary disease. The manner in which the intestinal disturbance is brought about —its mechanism—may be obvious in most instances, but in others it is understood poorly or not at all. The same may be said of intestinal dysfunction resulting from, or seen in association with, organic and functional alteration in the central nervous system, in the cardiovascular system and in diseases that are more or less systemic in their effects and manifestations like the chronic infectious diseases, nutritional deficiencies, endocrinologic and metabolic disorders, ocular and labyrinthine diseases and addictions to drugs. In all these etiologic types of intestinal dysfunction the relationship of cause and effect may not be clearly perceived, but it is apparent that some such relationship exists. I designate all these varieties of intestinal dysfunction fundamentally neurogenic in origin, for in one way or another, and on final analysis, the intestinal disturbances may be considered as resulting from imbalance of the autonomic innervation of the intestine or from a functional or organic disturbance in its intrinsic innervation. Whatever the mechanism of their production, clinical manifestations of intestinal dysfunction of all types and of all grades of severity are encountered.

Roentgenologic examination of the intestine may or may not reveal confirmatory evidence of the dysfunction which the clinical manifestations indicate to be in operation. This seems to depend largely on the severity of the manifestations. As is the case when intestinal dysfunction occurs as a result of organic intestinal disease, there are observable changes in intestinal motility, in tonus and, to the extent that they are observable roentgenologically, in the secretory and absorptive faculties of the intestine. A description of the particular kind of intestinal functional change that occurs as a part of the diseases of the organs and systems which I have listed will not be included in this discussion. Roentgenologically demonstrable functional changes that are in any way characteristic are observed in one category only, that of the nutritional deficiencies, in which I include the poorly defined but similar syndrome developed as a result of digestive secretory deficiency. There, however, the physiologic alteration is of considerable magnitude, having been in operation long enough to cause, or to be caused by, certain possibly reversible structural changes in the intestine and probably in its intrinsic nervous system as well. In the other categories the functional changes are nonspecific, at least in the sense that their cause might be predicted or even guessed at objectively with only the roentgenologic changes noted in the intestinal tract at hand.

It is possible that we roentgenologists have been failing to realize the scientific possibilities of a more intensive roentgenologic study of these functional intestinal disturbances. The observations of Brown, Pendergrass and Burdick[1] on the changes in motility in the gastrointestinal tract in hyperthyroidism are illuminating, but I have not become acquainted with comparable observations in the other categories. At the moment, I do not foresee just how studies of this kind assist practical clinical diagnosis to an appreciable extent, but they may well serve to throw light on more fundamental problems of pathologic intestinal physiology.

---

[1] Brown, R. B., Pendergrass, E. P., and Burdick, E. D.: Gastro-intestinal Tract in Hyperthyroidism, Surg., Gynec. & Obst. **73**: 766-783 (Dec.) 1941.

Quite obviously roentgenologic examinations of the particular organs and systems are used liberally in the process of localizing the disease or functional derangement which is in turn causing these secondary kinds of alteration in intestinal function. Once structural and functional change in intra-abdominal and extra-abdominal organs and systems capable of exerting an unfavorable influence on the intestine is excluded, then, simply by a process of elimination, the clinical manifestations of intestinal dysfunction are pronounced to be on a primary functional basis.

INTESTINAL DYSFUNCTION WITHOUT DEMONSTRABLE CAUSE OR ASSOCIATION

It is apparent that to entertain a diagnosis of *functional intestinal disorder, in the commonly accepted* restricted sense of the term, requires a much greater diagnostic effort than is usually needed for any other gastroenterologic diagnosis. Nevertheless this kind of a diagnosis must be made more frequently than any other. Bockus and Willard,[2] for instance, found some type of functional abnormality of the large intestine in 46 per cent of 1,000 consecutive office patients whose clinical records were studied, and Jordan and Kiefer [3] found a similar situation in 30 per cent of a large number of hospitalized patients.

Intestinal dysfunction without demonstrable anatomic or physiologic cause may be said to occur in the large intestine, in the small intestine, in restricted parts of either or in both divisions at the same time. In general the symptoms and the clinical manifestations point to a disorder in one or all of the fundamental digestive faculties of the intestines, just as they do in physiologic disturbances for which an organic cause can be found. The clinical manifestations vary in intensity from those that are considered to be mild or relatively inconsequential to those that are pronounced and severe enough to cause genuine alarm in patient and physician. They have been variously correlated and classified under the general heading of intestinal neuroses. One clinical type is recognized in which the symptoms and signs indicate that the intestinal motility is chiefly disturbed; in another type, symptoms of secretory dysfunction predominate; in a third type, evidence of disturbance of both functions is observed. Simple constipation and so-called functional diarrhea are either included in one of these types or are treated as separate functional entities. Roentgenologic classifications are not often seen, but when they are made they tend to follow a similar pattern. The disorders are usually ascribed to the large intestine as if the small intestine had no part in them, but many writers emphasize that the derangements are general in the entire gastrointestinal tract although the manifestations may be most prominent in or confined to the large intestine.

Again the manner in which the functional derangement is produced is unknown, but the underlying factor is presumed to be a subtle psychogenic or emotional disturbance related to the intestine through the medium of the autonomic nervous control of the several intestinal activities. As is so frequently the case in biologic science in general, there is considerable knowledge about what occurs, but relatively little is known about why or how it occurs.

I do not intend to describe or even to list the roentgenologic evidences of primary intestinal dysfunction that have been described. Presumably most of them are valid when properly controlled. To recognize the presence and to evaluate the significance of these changes require an intimate knowledge of the normal intestine and its variations in the morphologic as well as in the physiologic aspects. In no field of roentgenologic diagnosis is the exercise of critical judgment and objectivity more necessary if unwarranted deductions and correlations are to be avoided. The roentgenologic investigation which is instituted to explain clinical manifestations of intestinal dysfunction, to localize the abnormality to some particular part of the intestine, to designate its nature or otherwise define it is to be looked on as an experiment in clinical research subject to control of extraneous influences, unrelated to the immediate problem, but independently capable of effecting changes in intestinal activity. The roentgenologic investigation which is instituted to discover and to define structural change in the intestinal tract is different in this respect, that in it physiologic alterations are largely relegated to a position of secondary importance, sometimes disregarded entirely, often circumvented, all in an effort to obtain the essential morphologic data on which to construct a pathologico-anatomic diagnosis. It is often necessary to induce rather drastic changes in what is called the "normal physiologic condition of the intestine" preliminary to the roentgenologic examination; some of these changes are prolonged and not easily distinguished from preexisting physiologic abnormalities. I cite as instances the rigorous purgation necessary to prepare the colon for examination with the opaque enema, the prolonged fasts preliminary to examinations of the stomach and small intestine and the administration of antispasmodic drugs. These must receive their share of attention when the diagnosis of a functional intestinal disorder is being considered.

There are other more or less distinctly unphysiologic aspects of the roentgenologic investigation of functional disorders of the intestine which require deliberation, too. Some of them are related to the patient, and some to the method itself.

The patient submits himself to the examination under varying degrees and kinds of emotional stresses. The individual variation is great, practically beyond limits of description. No 2 patients react to the examination or to particular features of it in the same way. Fear, apprehension, modesty, impatience and many other adverse psychologic reactions immediately connected with the conditions of the investigation, and related indirectly or not at all to the reasons for it. may be the cause of minor, but also of major deviations from the somewhat arbitrary standards of normal intestinal activity.

Some of the unphysiologic features inherent in the roentgenologic method have already been mentioned.

---

[2] Bockus, H. L., and Willard, J. H.: Functional Disorders of the Colon, Pennsylvania M. J. 37: 645-652 (May) 1934.

[3] Jordan, S. M., and Kiefer, E. D.: The Irritable Colon, J. A. M. A. 93: 592-595 (Aug. 24) 1929.

There are others. The opaque enema, for instance, is an unnatural, unphysiologic and to most patients an abhorrent procedure, even if administered without preliminary purgation and enemas. In my opinion the evidence of abnormal physiologic change brought to light with its use is highly unreliable, especially if the evidence is based on changes observed only once and perhaps only at the time of a single roentgenographic exposure. I hesitate to attach abnormal physiologic significance, for example, to a contracted portion of the sigmoid colon in which the pattern of the mucous membrane is essentially unchanged, to a general decrease or increase in the caliber and length of the intestine, again with the pattern of the mucous membrane unchanged, or to so-called functional changes in the pattern of the mucous membrane when evidence of other change is lacking. In view of the unphysiologic character of this particular examination it is easier to think of such changes as being inherent in the procedure than to ascribe clinical significance to them without due consideration of all possible factors in their production.

There are certain features about the opaque meal, too, which give cause for reflection when search is being made for roentgenologic evidence of intestinal dysfunction. The opaque suspension may be unpalatable or nauseating to the patient, a circumstance which may alter the motility of the small intestine, if only by causing delay in the emptying time of the stomach. The time required for standard opaque meals to pass from the stomach through the small intestine and thence through the colon is by no means constant. This transit time may be accelerated or decelerated by one or a combination of several of many extraenteral factors. For purposes of investigating the motility of the intestine, and by this I mean the character and effectiveness of its movements, the opaque meal must be standardized not only in its composition, but also in its temperature, quantity and viscosity and in the manner of administration—that is, in small quantities over a relatively long period of time or in total amount at one time. Medication that the patient has been receiving must be given consideration as to whether it has affected the intestine primarily or not. In the large intestine and even low in the ileum the contrast meal tends in most persons to become dehydrated and thereby loses some of the physical characteristics it had when it was administered. I cannot lose sight of this which seems to me to be an important factor of apparently abnormal intestinal activity, especially in the patient who is habitually constipated or is constipated for the time being for one of several reasons, such as recent purgation, change of diet, apprehension or other emotional upset. I visualize the physical state of that viscous heavy mass with which the colon is struggling and suspect that perhaps the colon which under these circumstances has a normal appearance is the one which should be held in suspect.

These are but some of the sources of confusion in the roentgenologic diagnosis of primary functional intestinal disorders. Another is related to the diagnostic nomenclature. For what it is worth, my experience leads me to suspect that the nomenclature was derived from clinical and not from roentgenologic sources. I say this because I so rarely find convincing roentgenologic evidence of intestinal irritability, of spastic phenomena, of intestinal instability or of hypersecretion of mucus in patients whose clinical symptoms warrant, in the opinions of my gastroenterologic consultants, such diagnoses as "irritable colon," "spastic colon," "unstable colon" and the current equivalent of the term "mucous colitis." I am impressed also with the frequency with which I see patients who have large dilated rectal ampullae, and other patients who have conspicuously long and comparatively voluminous colonic loops, who are not and never have been constipated. As I read the literature on functional intestinal disorders, I note that a narrow contracted descending colon can be the cause of constipation in one patient and the cause of diarrhea in another. The best examples of the mucous "string sign" of Crane which I have collected were in patients who happened to have no prominent clinical evidence of intestinal dysfunction, but were subjected to roentgenologic examination for entirely different reasons.

It is not without considerable chagrin that I set forth some of the difficulties which I personally encounter with the roentgenologic diagnosis of functional intestinal disorders. Some of them are, I think, real and are sensed by many roentgenologic diagnosticians; others are possibly peculiar to me and to the nature of my practice. In no sense is it my intention to discourage continued endeavor along these lines, but I would like to encourage the adoption of a critical attitude to avoid unwarranted conclusions and correlations which are made now and then.

COMMENT

Without doubt the greatest contribution which the roentgenologic examination of the intestine makes to the diagnosis of functional intestinal disorders is the facility and accuracy with which it can be made to exclude organic intestinal disease as the cause of the clinical manifestations of dysfunction. Roentgenologic diagnostic maneuvers are also called on to assist in the diagnosis of disease in extraenteral organs which cause intestinal dysfunction indirectly. To the diagnosis of what I have chosen to designate as primary functional intestinal disorders, that is, those that have no demonstrable somatic cause, the roentgenologic examination of the intestinal tract has, in my opinion, no definitive contribution to make. Possibly improvement in this field will come as knowledge of the fundamental neuromuscular mechanism of intestinal activity accumulates. In the meantime I venture to propose that the roentgenologic examination that is undertaken specifically for the study of intestinal function be better adapted to that purpose, chiefly by eliminating so far as it is possible to do so all extraneous factors that may influence intestinal function adversely. Some of these have been indicated; others will suggest themselves. Much knowledge will of course continue to be derived from careful correlation of clinical and roentgenologic data. The possibilities of newer roentgenologic technics, such as kymography, have only begun to be explored. The most salient information will probably originate, as it has in the past, from the physiologic clinical research laboratories.

TREATMENT OF INTESTINAL CONDITIONS AS BASED ON DISORDERED FUNCTION

DONOVAN C. BROWNE, M.D.
GORDON McHARDY, M.D.
and
GEORGE WELCH, M.D.
New Orleans

The therapeutic requisite for the functionally deranged intestinal tract is adequate knowledge of established normal enteric behavior coupled with cognizance of the many factors causing alteration in this functional pattern

The psychogenic functional intestinal disorders in motor, secretory, excretory or sensory physiologic disturbance may simulate or eventuate in clinical syndromes emanating from primary structural change. Conversely, organic intestinal impairment, systemic disease or infection, chemical reactions, deficiency states, endocrinopathies and metabolic disturbances often, in the bizarreness of their symptoms, adapt themselves to or actually arise from psychogenic disease. The difficulty in clinical distinction is readily discernible; the issue is reemphasized to insist that a meticulous case study is an essential of therapeusis. One cannot condone the suggestion of Pulsifer[1] that from the history and from physical examination alone it is permissible to conclude that a disease is psychogenic. It is preferable to gain a conclusive diagnostic evaluation; thereby, speaking with certainty, one can instill assurance into the patient who by nature is a skeptic.

The management of functionally manifest enteritides, specific in causation, immediately appears simplified in consideration of therapeutic attack on the causal factor. However, too frequently the concomitant or resultant physiologic alteration in the intestines dominates the clinical picture, so that the result of treatment directed at the specific cause is obscured by the more persistent secondary disturbances.

The actual therapy of the psychogenic derangements is necessarily involved No standardized program of treatment could be applicable to all patients with neurogenic disease. The specificity of pharmacologic aids is limited. Comprehensive interpretation of type of personality, structure and reaction evolves itself into evaluation of the intricate relationship of psyche and soma in the person susceptible to emotional precipitants. The true importance of emotional contribution to gastrointestinal disease is well appreciated, the classical work of S. Weir Mitchell, Pavlov and Beaumont and the more recent contributions of Alvarez,[2] Wolf,[3] Jones[4] and others[5] leave little for the authors on the psychodynamic aspects of battle reaction to add. It is disappointing that too few of the observers during this recent global strife felt that the indications for therapeusis fell within the realms of internal medicine; there was too great a tendency to label many easily rehabilitable patients neuropsychiatric and to discharge them so stigmatized. Now that large group of emotionally disabled patients with gastrointestinal disturbances who either should not or would not be permitted to be relegated to the psychiatrist for therapeusis returns to civilian life to join the "big time operators" (Dr. Sarah Jordan) at a time of great national instability. Evaluation to determine whether the entity is truly psychogenic in origin, existing with or without resultant organic disease, and whether the causal emotional factors are too deep seated and too complicated to permit management without the assistance of a neuropsychiatrist therefore is the first move It is immediately obvious that the constitutional psychoses are neuropsychiatric problems, that certain of the persons with depressive psychosis, hysteria, compulsive obsessions or hypochondria and the persons who are simply inadequate will require cooperative management with the neuropsychiatrist, and that the larger group would not appreciate being termed neuropsychiatric, but would resent it to the degree that resultant insult to the psyche would actually be detrimental to the patient's future. Eusterman[6] has suggested that a neuropsychiatrist should be consulted only if after eight weeks of management the patient has failed to respond. Sarah Jordan[5c] indicates that in most cases of acute disease there will be spontaneous response to reassurance, but warns that the cases of long standing require, besides reassurance and readjustment, the supplement of actual therapy of the gastroenteric tract in restoration of neuromuscular and secretory function and that if these measures precede the development of organic disease the prognosis is favorable.

MANAGEMENT OF THE PATIENT

Psychotherapeusis is difficult to break down to a simplified therapeutic process An attempt is made to bring forth the practical aspects applicable to the patient who can and will be best managed by a competent physician who has an understanding of personalities This paper cannot be an intensive review of psychotherapy. In agreement with Chester Jones[7] we feel that a competent "family physician" who has the confidence of the patient is in the best position to provide reassurance and stability if he is willing to dedicate the time in applying basic educational principles to create for the psychogenically disturbed person what will be for that person an artificial regulation of living habits, regularity of rest and exercise approaching as closely as attainable a normal life for his individual abilities

Yoskin[8] simply depicts the therapeutic picture to encompass the fields of rapport, ventilation, desensitization, restraint, reeducation and stabilization, psychotherapy of the family and compromise formation.

Most patients are best managed with an initial period of hospitalization whereby an environmental change is realized; they are relieved of annoying responsibilities and permitted a supervised regimen including physical and occupational therapy This period is equally important to the physician, permitting him an opportunity to study his patient in a stable environment with the assistance of trained observers.

The practical application of principles by the average physician requires the desire and ability on his part to attempt physical and mental reeducation of the patient to create that mode of life termed "normal," though "artificial" to most patients.

The physical factors are concerned with modification of the method and mode of expenditure of physical effort to the abilities of the person. This evolves itself into regularity of living, individual application of physical exercise in competitive or noncompetitive activities as is elected best, adequate and well organized rest and recreational routine, regular eating habits and normal bowel hygiene.

Mental alteration assumes ability of the physician to alter the patient's reactions and with the patient to adjust certain flexible environmental influences. This includes correction of rigid attitudes of resentment, anxiety and sympathy. Creation of "insight" follows along the same line with evaluation of the patient's problems in terms of symptoms arising from emotional precipitants. Patient guidance in solution of conflicts is substituted for flight from reality. When possible, adjustment of social, economic, occupational, domestic, marital, sexual and other conflicts is achieved by alteration of environment to patient or vice versa. Disciplinary measures are especially applicable in the high strung hysteroid persons to aid them in understanding that they may not be permitted to aggravate their fears or use them for exploitation. Reassurance by the confident physician is of value, permitting a degree of transference of responsibility for judgment and well placed praise for accomplishment. Suggestion therapy in the form of hypnosis, placebos, "vaccines" and "medications" has limited value; hypnosis alleviates many hysterical manifestations temporarily, and the inadequate person may be favorably influenced by the judicious application of the other forms of "ritual" suggestion. The mental reeducation of the patient will involve the application of all these measures to some degree; elected instances will require adjunct psychiatric consultation for psychoanalysis, "shock" therapy and more intensive psychotherapy. Careful management and intense interest on the part of the gastroenterologist will tend to achieve "resolution" of the neurosis, which amounts to adjustment of patient and environment to an extent where he is able to live in a degree of compatible harmony with the "rest of the world."

Chester Jones [7] suggested that a psychiatrist who has combined his knowledge of psychiatry with an understanding of the mechanisms of the enteric tract has much to offer gastroenterology; he added that such men are few in number. He concluded his analysis of the situation with the statement, "No one psychotherapeutic approach is universally applicable and the prescription must generally be based on a complex mixture." This unquestionably is true; a diagnostic issue, a psychiatric problem and a gastroenterologic management demand one competent to handle all three issues, and, further, besides the management of the patient there are dietary and medical considerations.

DIETOTHERAPY

It is agreed that unnecessary dietary restriction is detrimental and possibly may increase the patient's preoccupation with somatic complaints. Often, however, we are concerned with removing fads and fancies from the patient's concept of dietary management derived from injudicious medical advice or from self judgment of food idiosyncrasy. The simplest plan is to emphasize the importance of regular eating habits, stressing their relation to regulating gastroenteric motility and secretion, to indicate the requisite amounts of the essential ingredients and to incorporate these essentials in a typed-out, normal, nonirritating diet, preferably dictated in the patient's presence to indicate its applicability to his instance. Since the extremely irritable gastrointestinal tract is stimulated by any and all foods, some patients may be benefited by a twenty-four hour starvation period. In all cases having the additional instruction to grind all meats and purée all fruits and vegetables and to limit the quantities in the initial weeks of treatment is worth considering, with removal of these restrictions when the patient's condition is responding satisfactorily. Since to our way of thinking such is actually a normal dietary program, with condiments and special dishes the design of restauranteurs to persuade one to be indiscreet in diet, we consider it wise to point out to the patient that he is merely being instructed to behave normally and that he, being a gastrointestinally sensitive person, must not depart into dietary extremes at any time for fear of recurrent manifestations.

If one considers reflex (enteric) esophagospasm, reflex biliary dyskinesis and certain instances of hypoglycemia and ulcerative colitis as psychogenic in association or origin, then for these exceptions a more elaborate dietary program must be individualized to each instance.

Portis' [9] "fatigue" syndrome related to hypoglycemia may be managed as he vaguely suggests, by a "high protein, moderately high fat and relatively high carbohydrate diet," with the omission of free sugar and the addition of feedings at night. (Considering the possibility that this may be related to hypermotility of the bowel, we include it in this consideration.)

Respect for a patient's observations may lead one cautiously to outline an elimination diet when history of allergy is elicited. The principles outlined by Rowe or careful evaluation of the patient's assumed allergies may be adhered to until the physician has satisfied himself and the patient that no definite allergic phenomena exist.

In those instances of nutritional and vitamin deficiency, endocrinopathy and metabolic disease, specific dietotherapy is established.

PHARMACOLOGIC AIDS

The judicious administration of drugs is essential, though rarely specific. In most instances they are used for symptomatic relief in the period of adjustment. It is erroneous to use any drug which is habit forming or induces tolerance, and we therefore advise against all narcotics and amphetamine-like products.

The use of sedatives should be limited to the relief of pain and nervous tension. Analgesics in combination with sedatives and antispasmodics may often, by synergistic action, be more efficient. Narcotics should be limited to specific severe seizures. The barbiturates and bromides are most commonly used and either alone or in combination should be efficient; occasionally idiosyncrasy requires one to resort to chloral hydrate or the carbamide preparations. The minimum dosage should always be used and assurance against dependency emphasized, so that as the patient improves he comes to need such aid only in contingencies.

---

[9] Portis, S. A.: Psychosom. Med. 6:71-73, 1944.

A multitude of antispasmodics are available; atropine and its derivatives persist in most common usage. When an idiosyncrasy to atropine exists one may elect to use one of several synthetic proprietary products. No antispasmodic approaches the efficiency of glyceryl trinitrate in the relief of esophagospasm and biliary dyskinesis. Theophylline ethylenediamine also is effective in the relief of esophagospasm.

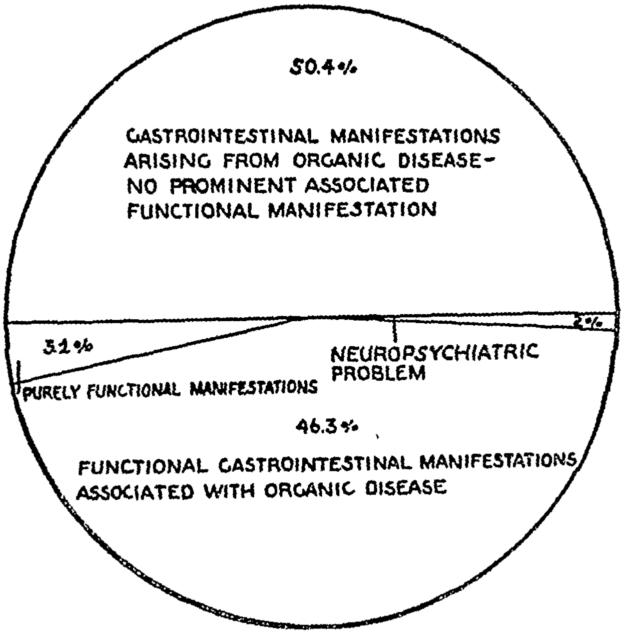

Chart 1.—Analysis of 500 consecutive cases of gastrointestinal disease.

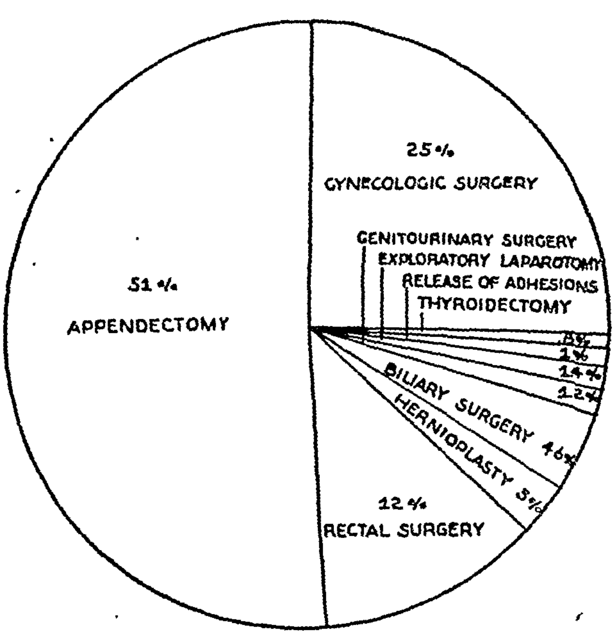

Chart 3.—Previous surgical treatment of functional manifestations.

Perhaps administration of calcium salts and parathyroid is an adjunct when there is sufficient suspicion of irritability of the smooth muscles of tetanic variety, and in certain of the deficiency states as sprue and celiac disease.

When patients have functional achlorhydria the administration of dilute hydrochloric acid is indicated as long as the status persists. So also in hyperacidity neutralizers such as alkaline powders and aluminum hydroxide have clinical application.

Substances aiding regulation of the bowels are essential in the irritable colon resulting in either constipation or diarrhea. The constipated person may occasionally be permitted mild cathartics initially in combination with liquid petrolatum, agar preparations and the other bulk-producing hydroscopic substances. As efficient management progresses all laxatives are withdrawn and use of rectal instillation of warm vegetable oils satisfies the patient's need for an occasional emergency evacuation.

We cannot establish an indication for therapeutic enemas and irrigations of the colon in the management of psychogenic colonic dysfunction. We are inclined to doubt clinically the value of sodium ricinoleate for *detoxification.*

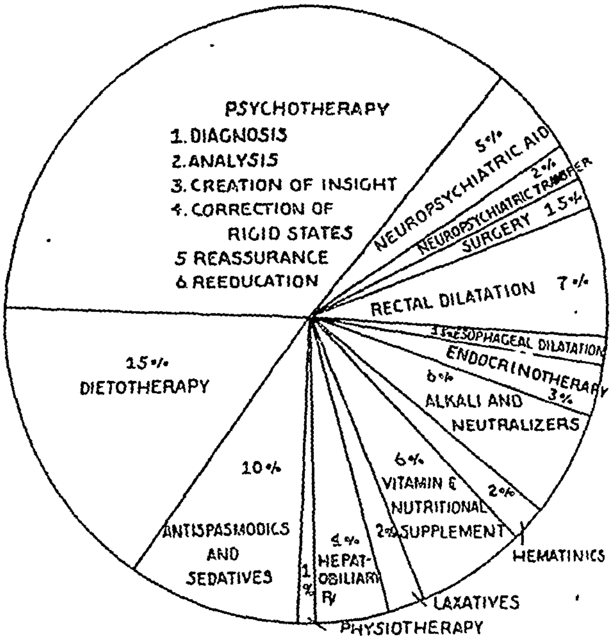

Chart 3.—Relative amounts of different types of treatment.

In the acute episodes of diarrheal states opiates may be required in general, absorptive astringents such as kaolin and pectin are excellent aids to supplement dietary instruction and sedation.

It is difficult to be tolerant with the advocates of bacterial vaccines for uncomplicated mucous colitis.

When dietary restriction, hypermotility or abnormal secretory response has resulted in anemia due to deficiency of iron, subclinical or clinical hypovitaminosis, these must be corrected specifically. We are inclined to favor various simple "tonic prescriptions" and the careful use of insulin to stimulate the appetite of the malnourished patient.

We are not attempting an intricate therapeutic outline for each of the symptoms arising from the physiologic disturbance, for the patient must be considered on the whole with a broad attitude of management covering the disturbance in its entirety.

ADJUNCTIVE MEASURES

Operative measures include operation on the sympathetic nerves for megacolon, correction of associated diseases requiring operative measures, rectal dilation for uncomplicated anal spasm and esophageal dilation, when necessary, for reflex cardiospasm. In general one should adopt an attitude of extreme conservatism in advocating any surgical measure. On the whole operation on the sympathetic nerves for relief of pain is not acceptable.

Physical therapy, including simple massage, exercises (passive and active), hot packs and diathermy have both a general and a specific application. Often simple measures such as contrast showers and warm tub baths do much to relax the tense patient.

Occupational therapy coupled with an effort at social and economic adjustment may call for more than passing consideration in aiding the patient to outline a useful constructive program of living.

To illustrate the relation of the issue to gastroenterologic practice, we surveyed 500 consecutive ambulatory patients with gastroenterologic disorders in an attempt to gain an evaluation of the problem (chart 1).

These results were surprising to us. In recent years so great a prominence has been given to disease of neurogenic causation that we had anticipated its predominance. Perhaps review of a larger series of cases would alter the relation to some extent, but we are forced to the conclusion that meticulous study of cases will eliminate many of the purely functional instances.

This left us 247 patients in whom functional disturbances existed. The average duration of symptoms prior to examination was 7.8 years. All had had previous medical care: a group (51.2 per cent) subjected to various surgical measures without relief is charted (chart 2). This evidence of mismanagement is recognized and is mentioned only to reemphasize the importance of diagnosis.

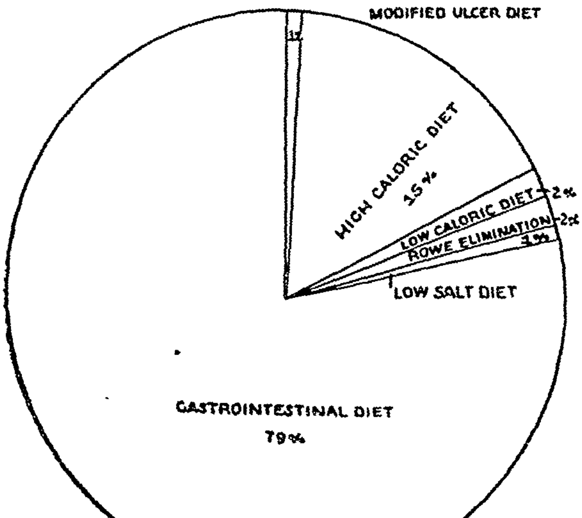

Chart 4.—Dietotherapy.

The breakdown of our management of these cases exclusive of correction of the causal organic factor is approximated as closely as possible in relation to importance of application (chart 3). Hospitalization was considered necessary in 10.2 per cent of cases.

Dietary instruction was meticulously exacted. In general the principles mentioned earlier in the paper were applied. Our specific application in these cases is illustrated (chart 4).

An approximation of what we might hope to achieve by this management is outlined in chart 5.

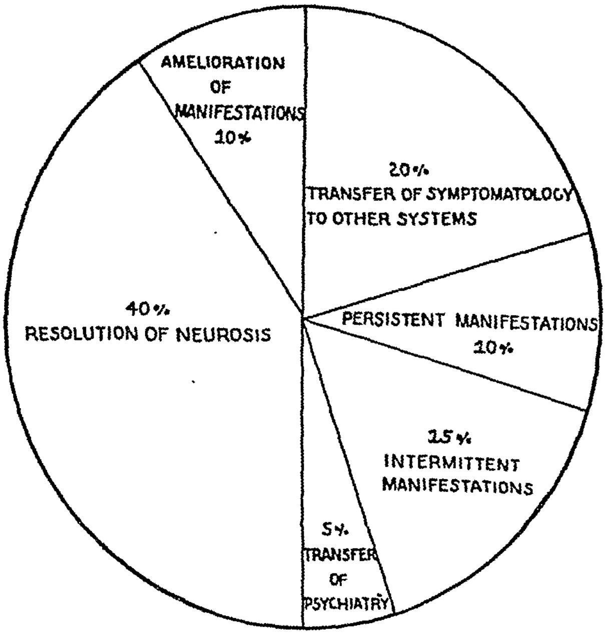

Chart 5.—Effectiveness of therapy.

CONCLUSION

There is no summarization for this presentation; it deserves expansion. It is hoped that we have stimulated an interest in the treatment of these functional intestinal disorders and the inclination properly to evaluate the problem first and then to treat the patient sincerely and rationally, discarding the indifference commonly felt toward those easily labeled neuropsychiatric.

1534 Aline Street.

ABSTRACT OF DISCUSSION

ON PAPERS OF DR. WEBER AND DRS. BROWNE, MC HARDY AND WELCH

Dr. Sara M. Jordan, Boston: In this era when the word "psychosomatic" is used so glibly, this symposium on intestinal dysfunction seems appropriate. We are accustomed to think of functional indigestion as of two categories: (1) that which is psychosomatic, altogether or in part, and (2) that which is somatic in origin. It is my opinion that the cases which are of short duration are often on a psychogenic basis, and in those instances psychotherapy is completely effective. In this group, however, certain cases of longer duration originally were on a psychogenic basis, but indigestion and dysfunction have become habitual. In these cases I believe that treatment for the somatic condition is definitely a necessity. In the second group of cases, I believe, functional indigestion is purely on a somatic basis, and I should like to use a new word in this connection, the word "somatopsychic," because one should not forget that there are not only psychosomatic but somatopsychic persons. There are some somatopsychic persons in this group of patients whose symptoms are produced by various causes, such as excessive food roughage, colonic interference in the form of laxatives and colonic irrigations, infections which leave a residue, physical stress and strain, and sometimes allergy, and in that group of patients there is a definite somatic factor, with occasionally an effect on the nervous system and the psyche, the reverse of the psychosomatic. Here treatment with digestive management is exceedingly important. These patients will not be cured by psychotherapy; they must be treated with digestive management. A few words about the roentgenologic diagnosis of functional indigestion: I disagree with Doctor Weber, inasmuch as I believe that if the patient is not prepared with purgation as roentgenologists are accustomed to do, there is an excellent opportunity to find out by roentgenologic examination much about digestive dysfunction, both with the meal and particularly with the barium enema. A gastrointestinal study is carried out, of course, to exclude organic disease, as he said; but it is also done in order to find out how that digestive tract—particularly the small and large intestines—functions, and repeated observations usually confirm the single observation. Furthermore, follow-up results after treatment show the changes from intestinal dysfunction to good intestinal function.

Dr. Zachary Sagal, New York: I wish to call attention to the importance of taking a detailed initial history in these cases of psychosomatic disease, for the purpose of subsequently evaluating the results of management, not so much from the standpoint of the physician as from the standpoint of the patient. We are dealing here with highly suggestible and self-indulgent persons to whom every minor discomfort looms large, and who will be dissatisfied with the treatment, although a good deal may have been accomplished. It has been my experience often that, after a period of management of eight months or a year, the patient will say "Here, Doctor, I have been coming to you so long and I don't see any improvement in my condition." If one is able to go back to the initial history and check up and confront the patient with statements such as, "When I first saw you, you complained of this, and that and the other thing," each time one will get the reply, "Yes, that hasn't bothered me much," and, "Well, that has improved." One will find that the patient is satisfied to realize that the major complaints, or at least 75 per cent of the initial complaints, have been alleviated. Otherwise the few complaints which the patient still has seem to loom large in his or her imagination, so that the patient has the notion that he has not been at all benefited. From the standpoint of therapy it is important, because the patient will be relieved of the anxiety that there has not been any improvement in his condition.

Dr. A. F. R. Andresen, Brooklyn: It has been a treat to me to listen to this conservative discussion today of psychosomatic influences on the gastrointestinal tract. I do not know where the radical psychosomatists are today. The fine presentation by Dr. Bargen[1] would keep us on even keel in regard to this subject of the influences of the psyche on the gastrointestinal tract. I like the term "somatopsychic" which Dr. Jordan gave us. I consider that important. On the other hand, I agree with Dr. Weber that one must not depend too much on what one sees in the roentgenogram as an indication of functional disturbances because, as he pointed out, many of the functional changes that are seen are really physiologic, or may be due to a variety of causes which some physicians have overlooked. He spoke of the distaste for the mixture as one of the points, and I might say that my colleagues and I made experiments with different flavors to try to decrease the distaste for the barium meal, starting with milk. We started with a delicious chocolate mixture, and many people were allergic to chocolate. We tried Coca-Cola as a flavoring, and that set up various disturbances in persons allergic to various constitutents of the Cola mixture. So one must be careful. One must not consciously look for evidences of psychic causes for these disturbances in the gastrointestinal tract; one should first rule out organic conditions. I recently had a man who was put through all sorts of psychologic tests and was given shock treatments over a period of several months, but who never had been given a thorough study. He was found to have a large retroperitoneal carcinoma which was involving his entire abdomen and chest, and everything else, by the time that he reached us; and he had been through a thorough course of shock therapy!

Dr. Harry M. Weber, Rochester, Minn.: Could Dr. Jordan and I have reviewed the cases which she presented together we would, I feel certain, be in complete unanimity of opinion. It was my purpose to argue for two distinct examinations of the intestine, one for the purpose of disclosing significant change in the physiologic activity of the intestine, the other for the purpose of determining the presence or absence of organic intestinal disease and of those congenital and acquired intestinal abnormalities capable of affecting the physiologic activity of the intestine adversely. To accomplish the latter satisfactorily it is necessary first to induce an unnatural or abnormal intestinal state, and then proceed to treat the intestine in a manner that in several ways is distinctly unphysiologic. A fundamental prerequisite, for example, is an empty intestinal lumen and an internal intestinal surface as free of "normal" intestinal content as it is possible to make it. To achieve this condition a prolonged fast is used in the preparation of the small intestine for roentgenologic examination, vigorous purgation in the preparation of the large intestine. These maneuvers are unphysiologic, and individual responses to them are extremely variable. Other factors are frequently introduced which alter the physiologic activity of the intestine, but that very alteration serves to make pathologicoanatomic change more clearly demonstrable. The roentgenologic examination conducted for the purpose of estimating the functional activity of the intestine should, I think, be conducted in a different manner. Factors capable of producing change in intestinal activity should be recognized and avoided or attenuated. Organic intestinal disease should have been excluded in a preliminary examination. The physiologic state of the intestine should certainly not have been altered by purgation, by a prolonged fast or by sedative medication. The patient should have been coached to present himself in the state which for him is routine and ordinary. As long as the insoluble salts of heavy metals continue to be used as contrast substances it will be necessary to make allowances for the specific effects which these substances have on intestinal motility. I would like to suggest that those who are conducting roentgenologic examinations of the intestine acquire and preserve an objective approach to this part of their work. It may have disadvantages, but these are outweighed by the critical attitude which this approach promotes. I would encourage such an attitude until there is more general agreement about the roentgenologic criteria used in the estimation of abnormal intestinal function.

Dr. Donovan C. Browne, New Orleans: I have nothing further other than to thank Dr. Jordan and Dr. Andresen for their talks.

Blood Pressure.—The first to measure blood pressure was Stephen Hales in England, who in 1733 attached a glass tube 12 feet 9 inches long to the left carotid artery of a horse, held the tube vertically and found the blood to rise to a height of 9 feet 6 inches. Poiseuille introduced the U form of mercury manometer in 1828. Von Basch, who was the first to perfect a sphygmomanometer for clinical use, had a glass cylinder containing a rubber bulb connected with a mercury manometer, later with a spring manometer. The open end of the glass cylinder was covered with a membrane. The cylinder was filled with water and was called a pelotte. The membrane of the pelotte was pressed over an artery against a bone. Potain's sphygmomanometer, 1889, replaced the water by air. Riva-Rocci in 1896 introduced the manometer of which most of the modern types are modifications. There has always been a question as to the effect on the blood pressure reading of the amount of soft tissue of the arm and the width of the cuff.—Downing, M. Elizabeth: Blood Pressure of Normal Girls from 3 to 16 Years of Age, *Am. J. Dis. Child.*, March 1947.

BENIGN STRICTURES OF THE BILIARY DUCTS

RICHARD B. CATTELL, M.D.
Boston

The management of benign strictures of the biliary ducts is one of the most difficult problems in abdominal surgery. While the diagnosis is usually evident from the history, the operative intervention to restore the normal flow of bile into the gastrointestinal tract presents many technical problems and requires the greatest ingenuity on the part of the surgeon. This paper will report on a series of 123 patients operated on at the Lahey Clinic previous to Jan. 1, 1945. Since that time 38 additional patients have been treated, and some of my most recent experiences will be discussed, because further improvements in technical methods have been made during this period.

No presentation of this subject should be made without particular emphasis on the prevention of benign strictures, since most of them are the result of a surgical accident during cholecystectomy. Furthermore, strictures that result from inflammation or from a stone that ulcerates the duct are preventable if early operative removal of gallstones is urged. The prevention of strictures will be discussed later when the causes of their formation are enumerated.

LITERATURE

During the past decade considerable interest in this subject has been demonstrated by a number of reports. Most of these have been concerned with methods of repair. Walters and his associates,[1] in a series of articles, have reported the largest experience, and a further report was made from the Mayo Clinic by Gray [2] in 1938. Lahey [3] described nine different methods of repairing strictures in a general survey of the problem in 1937. Later experiences from this clinic have been reported by Lahey [4] and by me;[5] we have described the causes and method of repair. Repair of strictures by anastomosis to the gastrointestinal tract was emphasized by Brackin and David.[6] Dragstedt and his associates [7] and Walton,[8] as well as new modifications, by Allen [9] and Cole.[10] The use of vitallium tubes was introduced by Pearse [11] in 1941 and in two subsequent reports.[12] There is general agreement as to the causes of strictures but a wide variation in methods employed for their repair. This suggests that no one method is applicable to all cases, and it is important that further review of experiences be made with particular reference to the results following the different procedures.

INCIDENCE

It is difficult to determine with any accuracy the frequency of strictures of the biliary ducts. Since it is most frequently a complication of previous surgical intervention on the gallbladder, some cases are included in the mortality of that operation, and other patients die subsequently of an obstructive cirrhosis with the underlying condition unrecognized. In over 5,000 gallbladder operations in this clinic only 1 operative stricture has been produced. A relative idea of the frequency can be obtained from the ratio of the number of strictures operated on to the total number of gallbladder operations. In a four year period, 1938 to 1941 inclusive, 909 gallbladder operations were performed, and during this time 19 strictures were encountered, an approximate ratio of 1 to 50, or 2 per cent. In the past eighteen months, however, 38 patients with stricture have been operated on, which represents 8 to 9 per cent of all gallbladder cases. This high incidence resulted in a specially selected group of cases, since all were referred. The ratio of benign strictures to obstruction of the biliary ducts due to cancer is 1 to 2.5.

Table 1.—*Age and Sex of One Hundred and Twenty-Three Patients*

Sex	No. of Cases	Age	Cases
Female	99 (80%)	20-29	11
Male	24 (20%)	30-39	26
		40-49	46
		50-59	33
		60-69	6
		70-72	1
		Youngest 21, eldest 72	

There were 99 women (80 per cent) and 24 men (20 per cent) in this series of 123 patients. This high proportion of strictures in women is in excess of that encountered in patients having cholecystectomy.

The age incidence is shown in table 1. Thirty per cent of the strictures occurred in patients under 40 years of age. It seems logical to assume that many of these patients had had disease of the biliary tract for a relatively short period of time, and the operative difficulties should not have been serious. The youngest patient was 21 and the eldest 72.

CAUSES OF STRICTURES

The histories of these patients have been reviewed and the operative findings scrutinized in an attempt to determine the underlying cause for the production

of the stricture. In many cases the previous operative records were available, so that it could be determined definitely; in others the probable cause was decided on and listed from the operative findings in the absence of previous surgical records. Since this method is subject to individual interpretation, some of the causes listed might properly be questioned.

The causes of the strictures are shown in table 2. Patients with congenital obstruction of the biliary ducts are not included in this series.

Operative injury had occurred in 99 patients, or 80 per cent of all cases. Since these injuries must be considered preventable, they will be discussed separately later in the paper. Eleven patients had a stricture resulting from long-standing inflammation of the common hepatic or common bile duct. In some the entire extrabiliary duct system was narrow and fibrotic. Others had localized narrowing and ulceration that was probably the result of the presence of a calculus in the duct. These represent long-standing cases of biliary tract disease and might have been prevented by earlier operative intervention.

Fibrosis and narrowing of the ampulla of Vater accounted for 9 strictures. Insufficient attention has been called to this cause of benign obstruction to the biliary ducts. The frequency of this condition is probably much greater than has been represented in this series. It was usually found in patients with recurrent calculi in the common duct. This cause of obstruction of the common duct is frequently unrecognized and can be determined only by the passage of graduated probes or by transduodenal exploration of the ampulla. Infrequent causes of benign strictures were adhesions in 2 patients and external trauma in 1.

Common duct	9
Excision of both	18

Operative injury to the ducts was recognized at the initial operation in a number of these cases, but usually the previous operative report contained no description of injury to the duct. The occurrence of hemorrhage during cholecystectomy, usually from loss of the cystic artery, is a common observation. An attempt to control it by the blind use of artery forceps or by mass suture of the area frequently results in injury to the common hepatic duct. This can be avoided by pressure on the hepatic artery, compressing it between a finger in the foramen of Winslow and the thumb anteriorly on the gastrohepatic omentum until the cystic artery stump can be accurately secured. Two other typical stories were given in a review of the operative and postoperative records, both of these following an apparently uneventful cholecystectomy. The first described the profuse drainage of bile from the wound which shortly followed the operation and continued as an external biliary fistula. The second stated that jaundice occurred a few days after operative intervention and became persistent, with acholic stools.

At reoperation, these were usually shown to be caused by obstruction of the common duct at the junction of the cystic duct as a result either of interference with the lumen of the duct because of too close ligature of the cystic duct or of removal of a portion of the duct at this point.

The site of the stricture aids in determining the manner of operative injury and is shown in table 3. The common hepatic duct or both hepatic ducts were injured in 49 patients, many of these patients giving the story of hemorrhage encountered at operation. The lower end of the common duct was injured in a localized area in 32 patients, the common duct being involved just proximal to the duodenum in 9 and in the region of the cystic duct in 23. Excision of large portions of extrabiliary ducts was encountered in 18 patients, and in many of these no remaining duct could be found between the hilus of the liver and the edge of the duodenum.

Strictures produced as a result of operative trauma are preventable. They may be the result of poor anesthesia, with the resultant difficult operating conditions, or failure to recognize the variation of the entrance of the cystic into the common duct, as well as the difficult situation in which a badly inflamed and contracted gallbladder may distort the anatomy. The experience of the surgeon with operations on the gallbladder is a determining factor. Whether the surgeon chooses to remove the gallbladder from below upward or to dissect the gallbladder down to the region of the ducts, it is important that the anatomy be fully demonstrated before the division of any structures is attempted. With the exception of patients with acute forms of gallbladder disease, it is my plan to open the gastrohepatic omentum, secure the cystic artery separately and demonstrate clearly the junction of the cystic duct with the common hepatic and common ducts before removing the gallbladder. Careful demonstration of this anatomy in every case will give the best assurance of avoiding injury to the ducts, but good anesthesia and good exposure are necessary to accomplish this. While cholecystectomy is the operation of choice for all patients with gallstones, it is much better to perform cholecystostomy if the surgeon feels that satisfactory dissection is not possible, rather than to risk possible injury to the duct. Frequent explorations of the common bile ducts during gallbladder operations as practiced in this clinic have not contributed to the formation of strictures.

Since this paper is primarily concerned with the prevention and repair of benign strictures, the diagnosis of the condition will not be included. It will suffice to state that all patients had obstructive jaundice unless an external biliary fistula was present. Internal fistulas into the duodenum were commonly encountered, often resulting in intermittent jaundice as the fistula opened and closed. Common duct stones and malignant obstructions of the duct must be excluded as well as jaundice of intrahepatic origin.

PREPARATION FOR OPERATION

Once the diagnosis of benign stricture is made, the time selected for effecting the repair is quite important. The best chance for success is at the original operation if operative injury is discovered. The dissection and mobilization of the ends of the duct at this time can be satisfactory, and a good suture can be obtained. If the injury is discovered during the postoperative period, unless the secondary operation is performed within a few days it is better to wait until the inflammation and edema subside in order to have pliable structures with which to deal. Many of the failures are the result of too early intervention. If an external biliary fistula persists, there is no urgency and the operative procedure should be delayed for at least three months. If obstructive jaundice persists throughout the postoperative period, such a delay cannot be tolerated and reoperation should be done in four to six weeks. If too early operation is attempted further portions of the duct system may be destroyed, as each attempt at repair that is unsuccessful makes further procedures more hazardous. In an editorial on this subject Dr. Lahey called attention to the many difficulties encountered and suggested that it usually would be better for the surgeon who had the misfortune to produce a stricture to refer the patient to one of the many surgeons who had had considerable experience in the repair of strictures. His opinion was based on the fact that many of the patients encountered had had multiple operations, and in 1 patient eight previous procedures had been performed.

A short period of preoperative preparation will suffice for those patients who have an external biliary fistula. Those who have severe obstructive jaundice, however, require a period of two to three weeks to get them in the best possible condition. A high caloric, high protein, low fat diet is best tolerated. This should be augmented by adequate vitamin therapy, particularly vitamin B complex, ascorbic acid and vitamin K. The last mentioned should be given parenterally in excessive doses, with or without the oral administration of bile salts. Four milligrams of "hykinone" (menadione sodium bisulfite) given twice daily subcutaneously or with intravenous fluids should suffice. Intravenous dextrose solutions, amino acids and blood transfusions may be required for a short period previous to operative intervention.

In view of the technical difficulties usually encountered and because of the length of time required for the repair, I employ fractional spinal anesthesia, utilizing tetracaine hydrochloride weighted with dextrose solution. This gives the best operating conditions possible for whatever time may be required. If general anesthesia is preferred, intratracheal cyclopropane supplemented with curare to aid in relaxation may prove satisfactory.

OPERATION

The seriousness of this problem is clearly shown by the number of operative procedures carried out in this series of 123 patients. A total of 344 operations was performed, 180 of these having been done previous to the patients' admission to this clinic. This figure includes 57 previous repairs of stricture before the patients came under observation here. There were 164 operations for repair performed, which included 32 repeat operations. The extent and number of the surgical procedures are only part of the picture. Severe hepatic damage was present as a rule, and long periods of disability with economic loss resulted from the stricture formation.

There are two general plans for the operative repair of stricture. The first includes the plastic procedures and end to end suture for restoration of the continuity of the duct itself, preserving the sphincter of Oddi and the normal entrance of the biliary passage into the duodenum. The second method of repair, usually employed when portions of the duct system are missing, consists of the suture of the proximal end of the duct to some portion of the gastrointestinal tract—stomach, duodenum or jejunum. All methods of repair are modifications of one of these two methods.

The general principles underlying a successful repair are listed in table 4, and these apply to either of the general methods of repair. The most important principle is accurate approximation of mucosa to mucosa in any type of anastomosis, whether this be duct to duct or duct to gastrointestinal tract. This must be obtained without tension; in order to accomplish this, adequate mobility of the two ends is essential. Every attempt should be made to avoid leaving any defect in the biliary duct, as operations utilizing a tube to bridge a defect have given poor results. The repair should be performed over a mold or tube, and this should remain in place for a period of several months whenever possible. This maintains an adequate opening during the initial healing period as well as during the final reparative process, when fibrous tissue is absorbed after several months.

TABLE 4.—*Principles of Treatment*

Mucosa to mucosa in any anastomosis
Accurate approximation without tension
Insert T tube through a separate incision in the duct
Indwelling biliary duct tube is anchored
Avoid leaving defects in the biliary ducts
Prolonged tubal drainage is essential after repair

Total, 80 patients		94

If a T tube is used, the vertical limb should be brought out through a separate incision in the duct, making the repair over the horizontal limb.[13] If a tube is implanted within the duct it should be anchored. If the tube passes through the ampulla of Vater it will pass in most instances. Likewise, most tubes will pass irrespective of anchorage if the duct is anastomosed to the gastrointestinal tract.

RESTORATION OF THE CONTINUITY OF THE BILE DUCTS

Whenever possible, a method of repair should be employed which restores the continuity of the duct and preserves the sphincteric action at its entrance to the duodenum. In the past insufficient emphasis has been placed on methods which will accomplish this. As a result of the experience reported here, far better results will be obtained in the future. Because of the technical difficulties involved in finding the lower end of the duct when portions of the duct have been excised, the surgeon has been content to anastomose the proximal end of the duct to the gastrointestinal tract. There is no question that this is the easiest method, since the distal end of the duct is collapsed, contains no bile and is buried in scar tissue. With an increasing experience with strictures, it has now been found that it is possible to obtain adequate portions of the distal duct even when none can be demonstrated beyond the duodenum or head of the pancreas. In my opinion one of the greatest improvements in effecting a repair has been a procedure which mobilized the duodenum and the pancreas fully, permitting it to be drawn forward and turned to the left so that the posterior portion of the pancreatic head can be visualized. The anterior division of the superior duodenal artery can then be sectioned and the pancreas split so that the intrapancreatic portion of the common duct can be identified and dissected free for a distance of 2.5 to 5 cm. Care must be taken not to free the left side of the duct near the ampulla in order to avoid injury to the pancreatic duct. The mobility of the duct, head of the pancreas and duodenum which is thus obtained permits its approximation to a short common hepatic duct stump at the hilus of the liver, and this can be accomplished without tension. During the past seventeen months 38 patients with strictures have been operated on in addition to the series reported in this paper, and it has now been demonstrated that it is possible to do end to end suture of the ducts irrespective of the amounts that had been previously excised or can no longer be used for repair. Particular attention is called to this procedure because this method, which permits restoration of continuity of the duct, has given the best results. It must be admitted that this is a difficult technical procedure, but with increasing experience it has been accomplished with less difficulty.

Jejunum	8	
Tube implantation		1
Fistula transplantation		0
Total, 43 patients		56

Since there has been a considerable change in the operative treatment of benign strictures, this series of cases has been divided into two groups. Eighty patients were operated on prior to 1940 and 43 from 1940 to 1944, inclusive (tables 5 and 6). The chief difference in the two series is the great increase in the number of end to end sutures following excision of the stricture. Transplantation of fistulas has been discontinued. There were 14 anastomoses of the duct to the gastrointestinal tract in each series. In the more recent group of 38 cases not included in this study, anastomoses of the duct to the gastrointestinal tract have been discontinued, with rare exceptions.

Table 7.—*Operative Mortality*

The type of material over which the repair is performed is not as important as the way the procedure is carried out. It is important, however, to have as large a lumen in the tube as possible in order that it will not become encrusted with bile salts or pigment. The best repair of the duct in my experience is performed over the horizontal limb of a T tube brought out through a normal portion of the duct. Unfortunately, this is possible only when considerable portions of the duct remain. When large portions of the duct have been excised the use of the vitallium tube, which has been described by Pearse, has been satisfactory. It was used in 30 patients in this series of 123 repairs and has been employed in 14 additional patients during 1945 and 1946. Indwelling tubes, some form of French catheter or black rubber tubes have been used in a number of cases. More recently, Dr. Lahey has employed a new tube of bouncing clay, with satisfactory results. When a T tube has been used it has been left in place for from six to twelve months, and I prefer the longer period.

Deaths	2	1	3
Total	23	7	30

ANASTOMOSIS OF THE DUCT TO THE GASTROINTESTINAL TRACT

This method of repair was performed in 14 cases in each series, or a total of 28 patients. In the first group the proximal duct was anastomosed to the stomach in 2 cases and to the duodenum and jejunum each in 6 cases. In the second series no anastomosis was done to the stomach, since it was considered an unsatisfactory method. The duct was anastomosed to the duodenum in 6 cases and to the jejunum in 8 cases. I consider hepaticojejunostomy the procedure of choice if this method of repair is chosen. Hepaticojejunostomy is carried out by bringing a long loop of jejunum in an antecolic position and anastomosing the duct approximately 25 cm. from the ligament of Treitz. It should always be accompanied by enteroenterostomy. The Y loop or Roux principle has not been utilized for these anastomoses, although other surgeons have found it satisfactory. Allen described an ingenious method for repair, utilizing such a defunctionalized loop of jejunum, and modified it by turning in the serosa and anastomosing it to the proximal duct, with a temporary catheter brought out through the anastomosis. Cole utilized a similar method but produced a valve by enfolding the defunctionalized loop of jejunum to prevent reflux. The type of material over which this anastomosis is performed makes little difference since all will pass.

I have employed the de Pezzer catheter, an ordinary black rubber tube with a flange, as well as vitallium tubes. The latter were used in 7 patients, and in 6 the tube passed within a short period of time. Vitallium offers no particular advantage in this method of anastomosis.

POSTOPERATIVE TREATMENT

The postoperative treatment is similar to that of any serious abdominal operation. The parenteral administration of vitamin K is continued, and the prothrombin time is followed. Large amounts of intravenous dextrose, amino acids and blood transfusions are used as necessary. Vitamin K therapy should be continued for at least one week after operative intervention. Drainage of bile from the wound is commonly encountered, but if an effective repair has been obtained, it should stop within a period of two weeks. Bile salts are given during the first week. A cholagogue is continued for several months postoperatively when a tube remains within the duct system. If a T tube has been used it is irrigated twice a day after the first week, and this is continued for an indefinite period.

The operative mortality is shown in table 7. In the first series of 80 patients, 14 deaths occurred. In the second series of 43 patients there were 3 deaths. This reduction in mortality is largely the result of better preoperative preparation and particularly of the reduction of postoperative bleeding or hemorrhage by the use of vitamin K. An increasing operative experience with cases of this type has been a factor in reducing the mortality.

RESULTS

No detailed analysis of the results will be presented. The longer these cases are followed, the more recurrences of symptoms will be noted. In table 8 the results of anastomosis of the duct to the gastrointestinal tract in 21 patients who have been followed are shown, follow-up data not being available in the other 7 patients. Only 12 obtained a completely satisfactory result, while 4 were improved but had infrequent attacks of jaundice or fever. Nine were unimproved, and of this number all but 1 were reoperated on. There were 4 deaths in this selected group.

In table 9 the 30 patients who had a vitallium tube repair are listed. Seven of these had the duct anastomosed to the duodenum or jejunum, while 23 had an end to end repair of the duct over a vitallium tube. There were 2 deaths in the latter group, and satisfactory results were obtained in 19 cases. It was necessary to remove the tube in 2 of these cases as well as in a subsequent case not included in this series. In 2 patients the tube, in spite of its flange and anchorage, passed through the common duct into the duodenum.

The most satisfactory results followed end to end repair of the duct or plastic repair of the duct over a T tube. In both these procedures accurate approximation of the duct without tension can be obtained and the tube can subsequently be removed.

SUMMARY

A series of 123 benign strictures of the biliary ducts is reported. Eighty per cent were the result of operative injury.

The prevention of strictures is emphasized. Good anesthesia, adequate exposure and a careful anatomic dissection are prerequisites for the avoidance of this complication.

Two general methods of repair are available: first, anastomosis of the proximal end of the duct to the gastrointestinal tract and second, restoration of continuity of the duct by suture over a tube, preserving the normal sphincteric action at the lower end of the duct. The type of material used for the repair is less important than accurate suture without tension.

Repair of the duct is the method of choice and gives the best results. Anastomosis of the duct to the duodenum or jejunum can usually be avoided.

A method to obtain the portion of the distal duct by splitting the pancreas in patients in whom a large portion of the duct has been removed is described.

One hundred and sixty-four operations were done on 123 patients, with 17 deaths, a mortality of 13.8 per cent.

The best method of repair of the duct is by utilizing a T tube. When this is impossible, the use of an indwelling tube, either of rubber or of vitallium, may be satisfactory. Recurrence of stricture may take place at any time and require reoperation.

ABSTRACT OF DISCUSSION

DR. H. GLENN BELL, San Francisco: One point might be added for the prevention of a stricture in the removal of the gallbladder, a procedure in which the common duct has to be opened and drained. Whenever possible, if the common duct is drained through the cystic duct so that the primary opening of the common duct can be closed, this may lessen the chance of the patient getting a stricture. It requires judgment to know when to explore the common duct. Some patients have a stricture of the common duct because the duct was explored and probed, reprobed and dilated when it had nothing in it and when the wall was nothing more than chronic inflammatory tissue, which would probably have fuctioned very well if the duct had not been traumatized. I have had the same experience that Dr. Cattell has had; some patients have had up to six operations before I see them and, as Dr. Cattell modestly said, these cases are very difficult. I agree that an end to end anastomosis of the common duct is the one procedure of choice, and when one realizes how many methods have been described, it is apparent that no one method will apply to every single case. Dr. Cattell's method of increasing the amount of the common duct distally by rolling the head of the pancreas to the left and exposing it to get 2.5 to 5 cm. of distal duct is extremely ingenious and certainly will make it more possible to do the end to end anastomosis. The method of anastomosis of the proximal common duct to the gastrointestinal duct, with mucosa to mucosa, over a rubber tube or a vitallium tube, is the next procedure of choice. I have had to remove some vitallium tubes which had become plugged with inspissated bile.

DR. FRANK H. LAHEY, Boston: A great many strictures of the biliary ducts are caused by hemorrhage from the cystic artery or from the hepatic artery. They are the result of large accumulations of blood in a deep cavity. With a poor light and inadequate exposure, in despair, the worried surgeon blindly places a clamp on the bleeding point, a procedure which, if it controls the hemorrhage, always will include either the hepatic duct or the common duct. If one could teach these surgeons that a few precautions would avoid this—wide incisions, good light and the retraction of the duodenum to the left, which puts the common duct on the stretch and which visualizes the foramen of Winslow, even so that the vena cava can be seen on its back—I am sure that these accidents would not occur. It is pertinent to recall how easy it is to control these hemorrhages from the cystic or hepatic artery even if they occur. If the surgeon will only put his finger in the foramen of Winslow and lift up or put his thumb on the artery, the hemorrhage will be immediately controlled so that the clot can be wiped out, the bleeding point accurately found and ligated and the injury to the duct avoided. There are a few things that ought to be stressed about duct strictures; that is, since surgeons have learned to find the lower end of the common duct in every stricture, the problem has been simplified, even if not solved. This is the method that was learned in doing partial gastrectomies—the mobilizing of the duodenum, turning it over to the left and splitting the lower edge of the pancreas. There one will always find a good section of common duct because it is so situated behind the duodenum that it is impossible to injure it at the time of the cholecystectomy. This makes possible the end to end anastomosis which Dr. Cattell has stressed and which can be accomplished only when the lower end of the common duct has been mobilized. Long ago I proposed that when these end to end anastomoses are done and the T tube is inserted, it should not be brought out through the suture line, because when it is removed it will tend again to produce strictures. It should be put in through a separate incision above, and when it is withdrawn the end to end anastomosis remains intact. As to vitallium, all have misinterpreted the value of these tubes. They do have the advantage of being tolerated by the tissues because they are nonelectrolytic, but they have no advantage over any other tube in their ability to be plugged. The whole problem of implantation of tubes is, do they plug? Some of them plug regardless of the material used. I have now for some time employed a material called "bouncing clay," which was developed by the General Electric Company. It is a silicon which has all the qualities of rubber. It will stretch, it will bounce, it is flexible, it can be cast so that its caliber is of any size, it can have shoulders or bumps put on it so it will not pass, and it has the great advantage of fitting the tortuous channels that one has to deal with in these strictures.

Dr. Richard B. Cattell, Boston: Both Dr. Bell and Dr. Lahey emphasized that strictures are preventable. Adequate exposure and careful dissection of the cystic artery and cystic duct before their division will avoid injury. Dr. Bell raised the question that frequent exploration of the common duct might result in a higher incidence of stricture. This has not been true in my experience. In approximately 5,000 gallbladder operations at the Lahey Clinic the common duct has been explored in 1,800 patients and only 1 stricture has occurred, and in this patient the duct was not explored. If exploration of the common duct is indicated and the surgeon's experience justifies it, it can be done without any increase in the incidence of stricture formation.

APPRAISAL OF SURGERY IN THE TREATMENT OF BRONCHIECTASIS

RALPH ADAMS, M.D.
and
BERNARD J. FICARRA, M.D.
Fellow in Surgery, The Lahey Clinic
Boston

This report is an analysis of 50 consecutive, surgically treated cases of bronchiectasis at the Lahey Clinic in the five year period ending August 31, 1945. There has been no death, either in the hospital or during the follow-up period, and the series again confirms the prediction of early workers in thoracic surgery that invalidism from bronchiectasis may be cured and functional usefulness restored by appropriate pulmonary resection. In space of time covered, this five year period may be considered that in which thoracic surgery came of age. These years encompass those patients who received the benefits of improved surgical technic, effective chemotherapeutic agents and more seasoned judgment in clinical management. Granted that the care of bronchiectatic patients cannot be regarded as perfect until the disease is prevented from occurring, it would seem appropriate at this time to record the observations, practices and results emerging from one carefully studied group of cases.

From a socioeconomic viewpoint, bronchiectasis is an important pathologic entity, and no method of therapy has been more beneficial to bronchiectatic patients in altering their social destiny than surgical treatment of the disease. In order to comprehend fully the ramifying aspects of bronchiectasis, the social and psychologic distress found in such patients should be investigated as well as the purely physical manifestations. With this knowledge aforethought, and the fact that surgery offers a cure in most instances, the surgeon's role in reconstructing the social, psychologic and physical outlook of patients with bronchiectasis is self evident.

The opportunity to observe the sad result of chronic illness on character and life itself falls within the experience of every physician. The alterations in personality caused by physical distress have led psychologists to postulate a definite temperament resulting from physical deformity. There can be little doubt that a prolonged struggle against chronic disease may influence the character and career of any man. Patients with bronchiectasis often fall into this category. By the general public, these patients are branded as having tuberculosis. Oftentimes they have been studied in vain for tuberculosis; sometimes they have spent prolonged periods of time in tuberculosis sanatoriums. In the young, schooling is neglected because illness renders the child unable to keep pace with his classmates. With expressive but cruel wit, one child with a chronic cough was nicknamed "The Barker" by his fellows and another with foul sputum "Stinky," and they thenceforth attended school only under duress. The antisocial pattern may be more clearly defined in the late teens, when social contacts are made only under the handicap of a productive cough or foul sputum. The young man may be unable to hold his job because of recurring respiratory infections or chronic fatigue. The young woman may worry about scanty menstruation or suspected personal unattractiveness. Marriage is frequently postponed. If entered into, lack of libido and interruption of normal marital relationships by the necessity of cough and evacuation of sputum often strain the bonds of happy marriage. The increasing responsibilities of life in the late twenties and early thirties and the decrease of the recuperative powers of youth account for the large number of bronchiectatic patients who "break down" in this age period. Thus it can be appreciated that the social, economic, mental and physical aspects of bronchiectasis make this a subject of paramount concern.

ETIOLOGY

No one cause can be indicted in the etiology of bronchiectasis. Many factors may be incriminated, singularly or collectively, in the development of the disease. Among the most common contributing causes are:

I. Diseases of the accessory air passages
II. Respiratory infections and infectious diseases
  (*a*) Recurrent bronchitis, acute and chronic
  (*b*) Pneumonia
  (*c*) Measles, influenza, whooping cough, scarlet fever
III. Congenital malformations
  Cystic disease of the lung
IV. Bronchial obstruction
  (*a*) Foreign body
  (*b*) Hyperplasia of mediastinal lymph nodes
  (*c*) Carcinoma or adenoma of bronchus
V. Emphysema, atelectasis
VI. Situs inversus and sinusitis

From the Lahey Clinic.
Read before the Section on Surgery, General and Abdominal, at the Ninety-Fifth Annual Session of the American Medical Association, San Francisco, July 5, 1946.

From this categorization it can be realized that the basic mechanisms in the development of bronchiectasis are two: infection of the bronchial wall and bronchial obstruction. When disease of the nasal sinuses acts as a nidus for the production of chronic inflammation of the bronchial walls, damage, even destruction, of the musculoelastic tissue may occur. This is followed by loss of resiliency in the bronchial segment involved and dilatation of that segment. Dilatation of this type is conducive to an accumulation of secretions. The secretions may remain incarcerated in the bronchi for prolonged periods, with associated secondary infection.

The initiation to the development of bronchiectasis may be an acute infection of the upper respiratory tract, bronchitis or the diseases of measles, influenza, whooping cough or scarlet fever. In 31 of these cases, the basis on which bronchiectasis developed was found in causes of this category. In 10 cases bronchiectasis was a sequel to bronchopneumonia. In 6 cases the onset was insidious and lacking of a definitive or determinative cause.

Congenital defects in the bronchial tree have been mentioned as a basis for bronchiectasis. This thought is postulated in conjunction with cystic formations in the lung which appear to be true structural malformations. Often this is closely simulated by cystic bronchiectasis associated with bronchial stenosis. One of these patients had cystic bronchiectasis of an upper lobe, but it was not possible to determine whether the cystic disease or the bronchiectasis appeared first.

Obstruction to a bronchus may easily result in bronchiectasis. This occurs because of the interference with normal bronchial drainage. Foreign bodies, adenoma or carcinoma obstructing the bronchial lumen, or extrinsic bronchial compression often are factors in the production of bronchiectasis. Cases of bronchiectasis secondary to tumors are not included in this report. One of our patients had a peanut lodged in his bronchus at age 1. He coughed for the next nine years and finally had a left lower lobectomy for bronchiectasis, with alleviation of his symptoms.

Emphysema and migratory atelectasis have been incriminated as predecessors to the formation of bronchiectasis. Both of these fall into the category of obstruction to bronchial passages, with the related increase in intrabronchial pressure resulting in distention of the bronchus. Such bronchiectasis shows a tendency to be tubular rather than saccular in type and is largely related to the emphysematous state. Such cases are not true bronchiectasis and are not included in this study. Tuberculous ulcers of the bronchus are a potent source of local bacterial contamination and inflammatory bronchial obstruction which might antedate the onset of bronchiectasis, but this occurrence is more properly considered as a complication of endobronchial tuberculosis.

One of us reviewed 23 cases of situs inversus at the Massachusetts General Hospital,[1] in 5 of which there was bronchiectasis as well as associated diseases of the accessory air passages. One of the cases in the present group fulfilled the requirements of that syndrome: situs inversus, sinusitis and bronchiectasis.

Mention should be made of pseudobronchiectasis[2] which has been reported following pulmonary infections—especially virus pneumonia. In some cases following pneumonia roentgenographic evidence of bronchiectasis has appeared and then disappeared in one or two months as silently as it was developed; hence the name "pseudobronchiectasis," or "reversible bronchiectasis." A more appropriate name for this condition would be "transitory bronchiectasis." No such cases are here included.

From this brief discussion of the etiology of bronchiectasis it is apparent that causative factors are equally as interesting as the disease itself.

PATHOLOGY

The foundation on which bronchiectasis forms is bronchial infection and obstruction. Initially, the pathologic process commences with hyperemia and thickening of the mucosa, which results from infection. Eventually the mucosa may protrude into the lumen as papillary projections. These projections are extremely vascular, and from this source hemoptysis may arise. From dilatation peripheral to an obstruction, cylindrical bronchial enlargement or cavitation is produced. By continuation of the pathologic process the lung parenchyma is replaced by fibrous tissue. When a previously formed cavity harbors infection, purulent material is accumulated and offensive odors are associated with secondary invasion by putrefactive organisms. On occasion the formation of secondary pulmonary abscesses results. This is an infrequent occurrence, produced when septic material becomes sufficiently localized to cause sequestration of pulmonary tissue.

The histologic picture in bronchiectasis is one of inflammation, proliferation and destruction of tissue. The bronchial wall is infiltrated with leukocytes and lymphocytes. If the disease is of long duration, the glands, muscle fibers, elastic tissue and often the cartilage may be replaced by fibrous tissue. The epithelial lining is the last to be involved, and although its continuity may be disrupted its identity remains. Perforations in the bronchial wall may occur. If the blood vessels in the wall become greatly dilated and rupture, a second potential source of hemoptysis is present. In the event that these vessels become thrombosed, the thrombus may produce an infected embolus resulting in a metastatic brain abscess. From recurring episodes of bronchopneumonia the adjacent pulmonary tissue becomes infected, and later fibrotic. This situation produces peripheral zones of compensatory emphysema.[3]

A cough present from birth may indicate congenital bronchiectasis. The lung in such instances may have many cystlike cavitations. These cysts are lined with a layer of epithelium, flattened or cuboidal, which may be ciliated. This pathologic entity may be rightfully termed congenital cystic disease of the lung. It must be remembered that formation of a cyst in the lung that appears to be a true structural malformation may be closely simulated by cystic bronchiectasis associated with bronchial stenosis.

Bronchiectasis may be limited to one or more bronchopulmonary segments within a lobe, other segments of the lobe being normal. Although the lower lobe of the lung is the site of most frequent involvement by bronchiectasis, there is a striking tendency for the disease to be localized to the basal division and for the dorsal division to be spared. This fact stands in sharp contrast to the localization of putrid pulmonary abscess, which is found with greater frequency in the

dorsal division of a lower lobe than in any other single location. Bronchiestasis may also be multilobar in its distribution. Because of this tendency of the disease toward selective localization the rationale for proposing the resection of the involved bronchopulmonary segment is justified. This principle of segmental resection finds special merit in early cases of bronchiectasis and in those patients with bilateral disease. In 2 cases of this series, the lower lobe was divided with removal of the diseased basal division, and preservation of the anatomically normal and functionally useful dorsal division.

By the time bronchiectasis is diagnosed the disease usually has reached its greatest pathologic status. It is not believed that bronchiectasis spreads insidiously from lobe to lobe. Occasionally bronchiectasis may spread after an acute pneumonitic episode, but our observations are in agreement with those of Churchill and Belsey.[4] "In general, however, the anatomic pattern of the disease remains static over long periods of time. Although the symptoms may vary, any attempt to explain an unsatisfactory surgical result on the basis of postoperative extension of the disease appears contrary to the observed facts of preoperative pathology. . . . The disappointing clinical results of some lobectomies can be explained by the failure to appreciate the high incidence of residual disease in an unresected lingula."

COMPOSITE CLINICAL PICTURE

The manifestations of bronchiectasis are more protean than the local pathologic entity would indicate. A type of inhibited personality encountered in patients with bronchiectasis has previously been mentioned. Such an alteration may be attributed to the serious, mentally disturbing social handicaps of a foul breath and an uncontrollable, productive cough. Patients in whom bronchiectasis develops in childhood rarely live beyond their fiftieth birthday without treatment.[5] The chronicity of their disease and the associated secondary respiratory complications frequently limit their work to an inefficiency level. Such a situation often ends in unemployment, poverty and personality problems. In the clinical picture of bronchiectasis it must be remembered that when bronchial dilatation alone is present symptoms may not be in evidence. However, episodes of hemoptysis of variable degree may occur. The term "dry or hemorrhagic bronchiectasis" has been applied to such cases. When chronic infection is pronounced, the chief symptoms are cough and purulent sputum. These symptoms usually are more evident in the morning because of accumulation of the purulent secretions during the night. In extensive disease, producing widespread destruction of pulmonary tissue, dyspnea on exertion may be present.

Physical signs vary according to the extent of the secondary phenomena of infection and atelectasis. Dulness, diminished breath sounds and moist rales over the involved pulmonary segments are positive findings. Dry bronchiectasis may yield no detectable sign even though an entire lobe be completely collapsed.

The presence of clubbed fingers in patients with longstanding disease may be a noticeable sign.

Roentgenography and bronchography are valuable aids in the diagnosis and evaluation of the extent of bronchiectatic disease. The roentgenologic findings of collapse, dilated bronchi and compensatory expansion of adjacent pulmonary tissue are characteristic. Fluoroscopy and lateral views are desirable, as the ordinary posteroanterior roentgenogram will often fail to reveal the shadow of an atelectatic lower lobe lying in the costovertebral gutter behind the heart.

Although bronchography is only rarely indicated or necessary in order to establish a diagnosis of bronchiectasis, it is, nevertheless, essential to a critical study of the pattern of the disease process. The extent of bronchiectasis can be accurately determined if bronchography is performed in such a way that every segment of the lung suspected of harboring the disease is outlined. A complete study of this type, adequately interpreted, permits a practical program to be outlined for the satisfactory surgical treatment of the disease. A simple, effective technic of bronchography which is safe for use by the general practitioner has been described by one of us.[6] A word of caution is not amiss, however, in calling attention to the danger of bronchography in the presence of emphysema.

SELECTION OF CASES AND PREPARATION

The advancement in pulmonary surgery has been accompanied by a remarkable diminution in operative mortality. As surgical experience increased it became evident that almost every patient with bronchiectasis who is a satisfactory operative risk should have the diseased pulmonary tissue resected. The operation of necessity temporarily jeopardizes the reserve capacity of the respiratory and circulatory systems. This reserve is initially endangered because the bronchiectasis has already diminished the physiologic efficiency of these vital systems. Bilateral bronchiectasis entails operative dangers out of proportion to the mechanical extent of the disease. Rarely do patients who have passed beyond the middle of life's span have sufficient reserve to warrant surgical intervention. Advanced emphysema and fibrosis may present intolerable deficiencies of blood oxygenation to the heart and the brain. Persons with chronic asthma have proved poor candidates for thoracic surgical procedures. The ravages of longstanding bronchopulmonary suppuration, sometimes complicated by empyema, cause nutritional, hemic and vitamin depletions that preclude operative success until they are corrected.

Patients under 50 with unilateral disease limited to one collapsed lobe, with infection temporarily quiescent and who are otherwise in good physical condition, constitute the best candidates for surgical treatment. Many patients whose condition is less favorable have been and can be subjected to a surgical regimen with satisfactory results, but at a greater risk.

In the preoperative preparation of the patient with bronchiectasis, it must be remembered that pulmonary resection is not an emergency but an elective procedure in point of time. For this reason, the patient should be subjected to operation under the most propitious circumstances, and should be operated on only when he is in the best attainable physical condition. Both general and local measures are employed in order to achieve this objective. The candidate for operation is placed on a nutritious diet with the addition frequently of iron and vitamin therapy, stated daily periods of rest and graded exercise. Postural drainage is carried out at least twice daily and is supplemented by aspiration bronchoscopy at intervals if necessary. Associated pleural infections are given dependent drainage, and resection is postponed until active infection is at a minimal stage. Treatment of sinus infection and other disorders of the accesso [illegible] should precede pulmonary resection. [illegible] true if the sinuses are actually blocked and filled with pus. The surgical procedure should be planned, so far as possible, for a season when epidemic respiratory infections are least prevalent.

One of the sulfonamide compounds, usually sulfadiazine, is given orally for at least twenty-four hours preoperatively, and sometimes for a week or more, in a dosage of 1.5 to 4 Gm. daily. Since the advent of commercially available penicillin, it has been used as a preoperaitve measure to diminish infection. Patients with large amounts of purulent sputum, a febrile type of temperature chart, leukocytosis, rapid sedimentation rate or a recent exacerbation of the disease may be given penicillin for as long a period as two weeks. The drug is administered preoperatively either intramuscularly or by inhalation. The inhalation method may be employed to augment the effects of penicillin given intramuscularly. When given by inhalation, 20,000 units of penicillin is dissolved in 1 cc. of isotonic solution of sodium chloride and given five times daily. The inhalation route is especially beneficial in patients with large volumes of thick purulent sputum.

OPERATION AND POSTOPERATIVE CARE

The operative technic at present employed has previously been described by one of us.[7] The technical details need not be repeated here, but a few principles can profitably be reemphasized. Incomplete fissures should be completed by gentle, careful dissection until the hilus is reached in order to minimize injury to pulmonary tissue and to reduce the likelihood of traumatic pneumonitis. Even when dividing a lobe (segmental pneumonectomy) we have several times found that the parenchyma can be separated along a segmental septum well down toward the hilus without the use of clamps. The hilar vessels should be individually exposed, anatomically identified and divided between ligatures. The bronchus should be isolated, so that it stands clear of all arteries, veins and parenchymal tissue, and closed in a meticulous fashion. No other feature of technical progress has equaled in importance the knowledge of how to close the bronchial stump so that it probably will heal promptly and without even a temporary fistula. Our personal preference indicates an infolding of the posterior membranous bronchus into the anterior cartilaginous portion with two rows of fine interrupted silk stitches, buttressed by a pedicle flap of parietal pleura or a free graft from the fascia of the serratus magnus muscle. The free lung graft and pedicle flap of lung are effective means of providing collateral support to the bronchial stump closure, but are no longer used. They possess the disadvantage, theoretically at least, of increasing the hazards of postoperative infection. The tourniquet technic of lobectomy, useful and valuable as it was in an earlier period, should now be considered only as a method of historical interest.

The immediate requirements following pulmonary resection are to prevent shock or anoxemia and to facilitate expansion of the remaining lobe or lobes. These objectives are accomplished by preventing accumulation of fluid in the pleural space, and by removal if it occurs. Secondly, obstruction to the bronchial tree must be prevented, for this is another possible source of pulmonary collapse (atelectasis).

Blood transfusion and oxygen therapy have been used in every case. A negative intrapleural pressure is maintained through an intercostal drainage catheter. The catheter is removed when the effusion becomes clear and serous, usually about the third postoperative day. Opiates are used sparingly, and efforts to raise bronchial secretions by voluntary coughing are encouraged. Fluids are administered by the parenteral route judiciously when indicated. If secretions accumulate which the patient cannot eliminate, catheter or bronchoscopic aspiration is employed.

The chief complications to be feared are infection and empyema. Empyema is still the most frequent complication following pulmonary resection, although it fortunately has not occurred in the past eighteen months in this series. Since the general abandonment of the tourniquet or mass ligature method of treating the hilus, the frequency of empyema has decreased. All these resections were done with individual ligation of the hilar structures. The most beneficial aids in eradicating postoperative infection are effective closure of the bronchial stump, administration of the sulfonamide compounds, both locally and parenterally, and more recently penicillin.

Penicillin has been administered routinely in a dosage of 40,000 units intramuscularly every three hours. It is discontinued as a prophylactic measure when temperature, pulse rate, leukocyte count and sedimentation rate are within normal limits. Another criterion for discontinuing the drug after lobectomy is complete reexpansion of the remaining lobe or lobes and obliteration of the pleural space. With complete expansion the possibility of empyema is diminished. Usually the drug is administered for about one week.

If delayed development of empyema is feared, penicillin is given intramucularly for a longer time. In addition, daily intrapleural instillation of 100,000 units of penicillin in 20 cc. of isotonic solution of sodium chloride may be employed until the pleural effusion has subsided. The classical indications for surgical drainage are to be followed if the effusion should become purulent. Penicillin is deposited in the pleural space after each paracentesis. When paracentesis is performed it is always desirable to remove as much fluid as possible before instilling the penicillin. If atelectasis should occur postoperatively, bronchoscopic aspirations may be followed by the introduction of 20,000 units of penicillin into the tracheobronchial tree.

This study has revealed that bronchiectasis is essentially a disease of young adults. Forty-five of our patients contracted the disease before reaching the fifth decade of life. Hence the complex social problems usually confronting young adults were intensified in these patients who carried the burden of an inhibiting disease. Almost all of these patients had some major or minor social, economic or mental problem. The disappearance of these problems paralleled the improvement in their health.

An analysis of the symptoms presented categorized the major complaint as cough (in 47 cases) productive of foul sputum (in 43 cases). Hemoptysis occurred in 21 patients and was more frequent in those persons with long-standing bronchiectasis. The complaint of dyspnea was recorded in 11 patients who also had been afflicted with the disease for many years. Pain in the chest was a proffered symptom in 16 patients; these, too, had suffered from the disease for many years. Clubbing of the fingers was noted in 5 patients, all of whom had known symptoms of the disease for five or more years.

3 to 5 years			5

The duration of the symptoms in 50 per cent of the patients ranged from one to five years; in 30 per cent bronchiectasis had manifested itself from five to ten years. Two persons carried their disease for over twenty years. The chronicity of bronchiectasis is thus self evident. In 1 of the patients, aged 10, the disease was present for nine years.

A statistical critique correlating associated diseases as to etiologic factors clearly indicates the close causal relationship of infections of the accessory air passages and respiratory tract to bronchiectasis. Forty per cent of the patients had sinusitis of variable degree. Twenty per cent had a sinus operation before pulmonary resection. Pneumonia antedated bronchiectasis in 20 per cent of the cases studied. Other diseases encountered were: tonsillitis in 6, pleurisy in 5, postpneumonic empyema in 3, a deviated nasal septum in 2, nasal polyps in 2 and mastoiditis in 1 patient. Thus of the 50 patients studied almost all had some previous disease of the accessory nasal sinuses or the respiratory system.

All 50 patients were treated by pulmonary resection. The disease was more frequent in the lower lobes and lingula than in the upper lobes. In 19 cases the disease was predominantly right sided, in 31 predominantly left sided, and in 5 there was bilateral involvement. One right pneumonectomy was done. One right upper lobectomy, 6 right middle lobectomies, and 6 right lower lobectomies were performed. Right bilobectomies were done in 5 cases. There was 1 left upper lobectomy. The lower lobe of the left lung was resected in 15 cases. The lower lobe and lingula were removed in 13 cases. Two segmental resections of the basal division of the lower lobe of the left lung were performed. From the distribution of these surgical procedures it is evident that the dependent lobes were most often involved. The lingula was also affected in 43.3 per cent of the cases in which surgical treatment was carried out for bronchiectasis in the lower lobe of the left lung.[4]

All the patients received intratracheal anesthesia with cyclopropane-ether. At times these gases were supplemented with nitrous oxide. The treatment of the hilar structures was by individual ligation. Meticulous care was devoted to closure of the bronchus. It is felt that this technic diminishes the possibility of bronchopleural fistula and other complications.

Postoperative complications occurred in 8 patients. There were 5 instances of empyema which necessitated drainage; in 2 cases there was a peristent bronchopleural fistula. These have been successfully closed.[8] Another patient had thrombophlebitis which responded to anticoagulation therapy and paravertebral injection of procaine hydrochloride.

In these 50 consecutive operative cases there was no hospital death and no death has occurred during the follow-up period. Five cases have been followed from three to five years, and there was complete alleviation of complaints. Twenty-four cases have been followed from one to three years. Two patients in this group still have symptoms from bronchiectasis in the opposite lung. Twenty-one cases have been followed from one to twelve months. All members of this group are well except 2 who have contralateral disease as yet untreated. It is interesting to note that most of these patients have secured a renewed competence to enjoy life and to assume its responsibilities. In no surgical group of patients can more grateful persons be found than among those who have been cured of bronchiectasis.

PROGNOSIS

The present status of the surgical treatment of bronchiectasis clearly indicates that prognosis following pulmonary resection is favorable. Our current experience with 50 consecutive operative cases accentuates the excellent prognosis, as almost all patients are cured or significantly improved.

---

[8] Adams, R.: Bronchopleural Fistula: Description of a Technic for Closure of Fistula *Persisting After Lobectomy*, Lahey Clin. Bull. 4: 78-85 (Jan.) 1945.

Patients are termed cured when certain criteria have been fulfilled: Cough and sputum must be absent; no hemoptysis must occur, and there must be no residual pulmonary or pleural infection. The final test is the patient's ability to resume normal activity. Forty-two of this group of 50 patients have fulfilled these postulates.

SUMMARY

A presentation is made of 50 consecutive cases of bronchiectasis in which surgical treatment was carried out at the Lahey Clinic during the five year period from Sept. 1, 1940 to Aug. 31, 1945. The physical and psychologic manifestations of this disease are described. The survey has indicated that bronchiectasis is essentially a disease of young adults. In the majority of the patients symptoms developed before the fifth decade of life. In this series, 31 women and 19 men were victims of the disease.

The major symptoms, in order of frequency, were cough, expectoration productive of fetid sputum and hemoptysis.

The chronicity of the disease extended over many years. Twenty-five patients had the disease from one to five years; 15 more carried the disease from five to ten years, and the remaining 10 patients had bronchiectasis from ten to twenty years.

The high frequency of preexisting sinusitis and pneumonia in the series of cases emphasizes the causal relationship between disease of the accessory air passages, infections of the respiratory tract and bronchiectasis.

Our surgical experience has confirmed the frequency with which the lingula and lower lobes are involved.

All these patients were anesthetized with cyclopropane and ether administered intratracheally. On occasion, nitrous oxide was employed as supplementary anesthetic.

In 8 cases of the series there was a postoperative complication. In 5 there was empyema which was treated surgically. In 2 a bronchopulmonary fistula developed, and in another thrombophlebitis.

The end results were: no hospital deaths and no deaths recorded during the follow-up period. Forty-two patients are apparently cured.

CONCLUSIONS

This present study of bronchiectasis has permitted certain conclusions. First, bronchiectasis is a chronic disease which often produces serious physical and mental debility. Second, comparison with the beneficial surgical results should clearly indicate the inefficacy of medical treatment as a curative procedure. In spite of the fact that symptomatic relief may be obtained by other measures, real cure can be effected only by resection of the diseased pulmonary tissue. Surgery, therefore, should not be advised as a last resort after other procedures have been tried and found to be ineffectual. Third, the surgical treatment should be advised early in the course of the disease. It is only by treatment in this way that most patients with bronchiectasis may be relieved of their economic handicaps, social ostracism and psychologic problems. Cure of the disease will encourage such patients to rehabilitate themselves and assume their normal place in society with a renewed courage and confidence.

ABSTRACT OF DISCUSSION

Dr. Lyman A. Brewer III, Los Angeles: The physical effects of the disease are well known; however, the psychologic effects may completely overshadow those of a physical nature. The character of the symptoms, cough and expectoration, make the patient an unwelcome member of society. For fear of embarrassment he more and more shuns society. The psychologic symptoms become manifest in the first decade of life, usually show a decided increase during puberty, and by the second and third decades are so firmly fixed as to change completely the patient's personality. Antibiotics have only a temporary effect in the treatment of bronchiectasis. Sooner or later the patient must make up his mind whether he is going to live with his disease or have a pulmonary resection. In many of the cases of milder disease resection is not needed. However, one must not be misled by an apparent minimal involvement as seen by the bronchogram, when severe hemoptysis or repeated pneumonia has been present; the symptoms must be the deciding factor and not the apparently small involvement as shown with iodized poppy seed oil 40 per cent. In the cases of moderately advanced disease, resection is usually indicated if the symptoms warrant and if the pulmonary reserve is sufficient. In the cases of advanced disease, resection is always desirable. However, one must be sure that a reasonably normal pulmonary tissue is present so that near normal life can be carried on. The improvement in the operative results has been due mainly to the development of the individual ligation of the lobar stump. It is in the meticulous handling of the bronchial stump that the main problems are solved. Our technic of closing the bronchus differs from that of Dr. Adams. We use interrupted fine tantalum wire on swedged needles. We have used no coverage of the stump. There have been less than 2 per cent of bronchial fistulas, all of them transitory and healing spontaneously. We have operated in over 60 cases in the last few years with this technic and have had no operative deaths and have had excellent results as far as alleviation of symptoms is concerned.

HERPES ZOSTER APPEARING AFTER TRAUMA

JOSEPH V. KLAUDER, M.D.
Philadelphia

Herpes zoster appearing after direct injury to large nerves or to the vertebrae in the region of a ganglion was observed by Mitchell and Keen during the Civil War. Herpes zoster also occurs after peripheral nerve injury, secondary to trauma of the skin or cornea which may be trivial.

Herpes zoster appearing after peripheral nerve injury has been frequently reported in the European literature although there are but few reports in the English literature. Such occurrence is of importance in view of laws governing workmen's compensation. Of added interest is consideration of the many untoward effects of trauma and possibly, also, of factors concerned in the awakening of viruses from a condition of dormancy.

REVIEW OF CASES REPORTED IN THE LITERATURE

Of the reported cases, the following were selected in order to illustrate certain features. Herpes zoster, with few exceptions, affected the nerve supplying the region injured. Injury to the surface of the skin or to the cornea was inflicted in various ways and was of variable degree.

Jadassohn's [1] patient injured the left thenar eminence with a splinter of iron, which was promptly extracted. Four days later vesicles appeared at the site of injury, and other lesions of herpes zoster developed on the

[1] Jadassohn, W.: Zoster nach peripherem Trauma, Schweiz. med. Wchnschr. 68:93, 1938.

left forearm and arm. The author regarded the initial appearance of the disease at the site of injury as proof of the relationship of injury to the occurrence of herpes zoster.

The patient reported by Künstler [2] was bitten by a person below the left nipple, causing laceration of the skin. Thirty-six hours later the site of injury became infiltrated and was surrounded by a well defined area of redness. Three days after the injury small papules appeared within this area of redness and also in the region of the fifth vertebra. After two days the papules became vesicles, and other vesicular lesions of herpes zoster appeared below the left axilla. The person by whom the patient was bitten recalled having had an eruption several months earlier. The description of the eruption suggested herpes zoster. Kunstler stated the opinion that the virus of herpes zoster may remain potent for some time in the mouth of persons who have had the disease.[3]

Bernard [4] has reported the case of a man who was injured on the left calf by the stroke of a whip. Seven days later an eruption of herpes zoster appeared on the posterior aspect of the injured calf. In Parfitt's [5] patient, trauma by lightning was attributed as a causal factor. A man while shaving was struck by lightning; the razor was flung from his left hand, and he experienced a stabbing pain radiating up the left arm. Two weeks later, after having had pain in the distribution of the left supraorbital nerve, an eruption of herpes zoster appeared along the distribution of this nerve.

The following cases from the literature are illustrative of herpes zoster appearing in twenty-four hours or less after trauma. Such cases have caused controversy as to the role of trauma on account of the short incubation period.

In Mendel's [6] patient, the sharp edge of a heavy wooden box fell against the anterior aspect of the right side of the chest. The skin remained intact, the ribs were not fractured and there were no pulmonary symptoms. The same evening the patient had a chill; the next day the initial lesions of herpes zoster appeared at the site of injury.

Barthélemy's [7] patient was forcibly hit on the right side of the trunk by a crane. There was swelling, but the skin remained intact. The same evening the patient had pain in the right side of the chest; the next day an eruption of herpes zoster appeared at the site.

The occurrence of herpes zoster about one month after injury is exemplified in the 2 following reports:

The patient whose case was reported by Netter and Ernoul [8] was a physician. One finger of the left hand was pricked while the physician was enucleating an eye, the cornea of which was the site of herpes zoster. Twenty-six days later he experienced pain in the forearm and arm. This was followed two days later by an outbreak of herpes zoster on the left side of the chest. The patient's two children had chickenpox twenty days after the onset of their father's herpes zoster. Chalier and Etienne-Martin [9] report the case of a man who fell, injuring the right frontal region. The site of injury remained swollen and red for about fifteen days. Twenty-five days after the injury herpes zoster supraorbitalis appeared.

Herpes zoster ophthalmicus has been reported as occurring after injury to the eye or in the region of the eye. Ammann [10] reviewed 8 cases collected from the literature. The injuries in these cases were: (1) the eye was hit by the branch of a tree; (2) by a piece of wood; (3) by a fist, and (4) by the tail of a cow; [5] the eye was splashed by solution of indigo and lime, and (6) by solution of sodium hydrate and trisodium phosphate; (7) a gas explosion caused burn of face, and (8) a piece of wood injured forehead.

In the 5 cases in which the interval between the injury and the appearance of herpes zoster was given, it was three days in 2 cases, six days in 2 cases and eight days in 1 case.

Generalized herpes zoster has been observed after injury. The patient whose case was reported by Pernet [11] burned the left thumb; two weeks later pain appeared in the left upper portion of the chest, followed one week later by an eruption of herpes zoster involving the same area, the front and back of the left axilla and the upper inner posterior aspect of the left arm. In addition there were scattered discrete vesicles on the face and scalp, over the trunk and thighs and a few below the knees.

Barker [12] reported the case of a man who was struck over the left eye (the nature of this injury was not detailed). Severe pain in this region persisted; one week later an eruption of herpes zoster ophthalmicus appeared on the left side. Five days after its onset, there was an outbreak of vesicles and papulovesicles on the trunk and arms.

Herpes zoster has been observed to occur after intramuscular injections in the buttocks, lumbar puncture, deep roentgen therapy in the region of a ganglion and from pressure of pathologic processes.[13] Schonfeld [14] reviewed some of the reported cases which occurred in such circumstances. The interval between trauma and the onset of herpes zoster varied between two and ten days. In Fox's [15] patient herpes zoster appeared about five days after an osteopathic manipulation of the spine.

REPORT OF CASES

In the following cases,[16] observed by me, herpes zoster appeared after injury. The injury was of variable degree and of variable causation. The disease appeared in the region of injury after an interval varying from one to nine days. In some of the patients, symptoms of sensory disturbance intervened between injury and the outbreak of herpes zoster.

[16] The herein reported case records of patients with herpes zoster ophthalmicus were presented at a meeting of the Philadelphia Ophthalmology Society on Oct. 18, 1945.

Case 1.—A machinist arising from a stooping position bumped the left side of the forehead against a fixed object. The injury did not lacerate the skin. The injured area pained for a short time. He felt otherwise all right and continued to work. The injury occurred at 6 a. m. Headache appeared the same day and became progressively worse throughout the next forty-eight hours. It was described as a dull pain radiating from the back of the head to the forehead, confined to the left side. The third day after injury an eruption of herpes zoster appeared, involving the supraorbital branch of the fifth nerve on the left side. The upper and lower lids were swollen; the eye was closed. The cornea was not affected. The patient resumed work two weeks after the onset of herpes zoster.

Case 2.—A woman getting out of the rear seat of an automobile struck the right side of her head on the frame of the door. The skin was not cut, and no swelling resulted. She regarded the bump as inconsequential, causing no inconvenience. The injury occurred at 5 p. m. The next morning pain appeared, which was confined to the right side of the head and neck and became more severe in the ensuing twenty-four hours. On the third day after the injury an eruption of herpes zoster appeared, confined to the right side of the scalp and forehead. The cornea was not affected. The eruption disappeared about two weeks after onset, but the pain in the head and neck persisted about three months.

Case 3.—A mechanical engineer during working hours carried in his right upper vest pocket a micrometer, a steel rule and a gage plug. He fell against a table, and the impact pressed these tools against the right breast. At the time he experienced pain which was not severe and soon disappeared. The skin was not broken. The injured region did not show any evidence of being bruised. About two days later the right breast, especially the nipple, was tender to touch, and a dull ache appeared in the right side of the chest, which prevented sleeping on the right side. One week after the injury herpes zoster appeared, involving the right side of chest at the level of the right breast, extending onto the back. The first eruption of vesicles appeared on the right breast. On account of pain he was incapacitated for one month.

Case 4.—A man was bitten by a horse on the outer aspect of the lower third of the right forearm. The resulting laceration was superficial and healed in a few days. Nine days after the injury an eruption of herpes zoster appeared on the right arm and forearm. There was pain in the region of the shoulder, radiating down the arms. Sleep was disturbed. The site of injury on the forearm was represented by congestion.

Case 5.—A painter working on a ladder slipped, striking the left side of his chest against a hard object in the region of the tenth and eleventh ribs. He had some pain, although it was not severe; he continued to work. He did not inspect the site of the injury until the next day, at which time there was no evidence of injury. In two days an eruption of herpes zoster appeared on the left side in the region of the injury.

Case 6.—A janitor, while sweeping, experienced a sensation of a foreign body in the right eye. The eye became red; the sensation of a foreign body persisted. Two days later an ophthalmologist removed a foreign body from the cornea. The day following its removal an eruption of herpes zoster, accompanied by pain, appeared on the right side of the scalp and forehead, extending to the base of the nose. There was an involvement of the cornea. Three weeks were lost from work. Pain disappeared in about two months.

Case 7.—A mechanic repairing refrigeration apparatus in a dairy forcibly turned a rusty valve; a leak resulted. A jet of sulfur dioxide squirted out. (Sulfur dioxide is a gas which is toxic when inhaled; cold reduces it to a liquid. It is an irritant to the skin, mucous membranes and eyes.) At the time of the accident he jerked back, his mask was dislodged and the jet of liquid struck his forehead and eyes. He experienced a burning sensation of both eyes with tearing. He said the left eye was more affected than the right.

The accident occurred in the early afternoon. When he arrived home about 4 p. m. the eyes were still burning, and the left side of the head became numb. That evening his wife noticed redness of the left side of the forehead. The next morning the burning sensation of the right eye disappeared but the left eye was swollen and the adjacent skin was red. An outbreak of blisters appeared on the scalp and the left side of the forehead. He then saw an ophthalmologist, whose diagnosis was herpes zoster with corneal involvement.

Case 8.—A boy aged 12 had a wart on the right side of the forehead removed by electrodesiccation. The operative area healed uneventfully. Two weeks after removal of the wart, herpes zoster appeared on the right side of the scalp and forehead. The cornea was not affected.

ETIOLOGIC MECHANISM

It is not reasonable to ascribe herpes zoster appearing after the aforementioned circumstances to a chance occurrence. What is the mechanism of the association with trauma and what should be the interval between trauma and the occurrence of herpes zoster in order to reasonably ascribe to trauma a causal role? Does the virus [17] of herpes zoster exist in the body at the time of injury, the latter producing a locus minoris resistentiae; is the virus introduced at the time of injury, resulting in an ascending infection of the nerve, or is the nerve involved through a transfer by the blood stream of the virus, since it is neurotropic?

It is well known that herpes simplex may follow exposure to the sun or appear during fever. Herpes zoster may occur as an untoward reaction to arsenic. These occurrences evidence the influence of endogenous and exogenous factors in awakening viruses from a condition of dormancy.

Neurologic complications varying from palsy of a single peripheral nerve to fatal meningoencephalitis following the administration of serums and vaccines, indeed, following almost all of the therapeutic procedures, have been recorded.[18]

In Keim and Wakefield's [18b] review of these complications, symptoms usually appeared within fourteen days. Some authors attribute the awakening of inapparent or latent viruses from a condition of dormancy as a cause of these complications. Keim and Wakefield regard such awakening as an explanation of Milian's theory of biotropism.

It is generally believed that the virus of poliomyelitis attaches itself to the endings of the olfactory nerve and enters the spinal cord by this route.

---

[17] Experiments made to ascertain if zoster is caused by a virus have given conflicting results. The opinion is stated by some that it has not been conclusively shown that zoster is caused by a virus and that the disease may represent a syndrome resulting from any process causing inflammation of the spinal ganglion. Others accept experimental evidence as valid proof of virus causation and regard the elementary bodies demonstrable in herpes zoster vesicles, particularly in the first forty-eight hours, as representing the specific virus of the disease. Proof that a virus causes herpes zoster is not as readily demonstrated as is such proof in the cause of herpes simplex.

[18] (*a*) Young, F.: Peripheral Nerve Paralysis Following Uses of Various Serums: Report of Case and Review of Literature, J. A. M. A. **98:** 1139 (April 2) 1932. (*b*) Keim, H. L., and Wakefield, R. F.: Flaccid Paraplegia Following the Diagnostic Use of Frei Antigen, Arch. Dermat. & Syph. **40:** 709 (Nov.) 1939.

Chalier and Etienne-Martin[9] formulated two circumstances in order to associate trauma with the occurrence of herpes zoster. 1. Herpes zoster should appear in the region or within the range of the injury, even though slight and not productive of a wound. 2. The disease should appear within one day to one month after the injury.

The incubation period of spontaneously occurring herpes zoster is not known. In discussing this period, the following considerations are pertinent:

It is perhaps generally accepted that the occurrence of chickenpox in children after exposure to a patient with herpes zoster, and vice versa, is not a chance occurrence.[19]

Of the reported cases of herpes zoster appearing after exposure to chickenpox and occurring in circumstances in which the time of exposure could definitely be established, the incubation period was about twelve days.

In experiments to ascertain whether herpes zoster is transmissible to animals, some investigators (Lipschütz,[20] Lamothe and Bernadou,[21] Pette,[22] Kuga and Masuda[23]) produced keratitis in rabbits forty-eight hours after inoculation with demonstration of inclusions within the nuclei of the epithelial cells of the cornea. Kuga and Masuda[23] observed such inclusions twenty-four hours after corneal inoculation.

Teague and Goodpasture[24] produced herpes zoster by inoculating the tarred skin of guinea pigs and rabbits. Vesicles appeared at the site of inoculation in three to four days in guinea pigs and not later than six to seven days in rabbits.

COMMENT

It is to be recalled that there are revolutionary implications in recent work on viruses. From considerations herein discussed, it is reasonable to believe that trauma may precipitate herpes zoster. The minimum degree of trauma and the interval between trauma and the appearance of herpes zoster in order to ascribe to trauma a causal role cannot precisely be defined. There is no experimental criterion of what this interval should be. From experimental evidence and clinical observations, the incubation period of herpes zoster ranges from a few days to about two weeks. From the cases herein reported and from the review of the literature, an interval of about one day to about three weeks from the time of injury to the appearance of herpes zoster predominated. It is difficult to exclude one or a few days, since in some cases there was a connecting link of subjective symptoms of nerve involvement in the interval between injury and an eruption of herpes zoster. From this pragmatic evidence the longer the interval beyond three weeks, the greater is the probability of a noncausal role of trauma.

PROGNOSIS OF HERPES ZOSTER TRAUMATICUS

The prognosis in herpes zoster traumaticus is that of spontaneously occurring herpes zoster. The disease in the majority of patients pursues an uneventful course to recovery; pain is not sufficiently severe to incapacitate. Of patients above middle age, however, pain may be severe and protracted, causing incapacitation.

The prognosis of ophthalmic zoster is more guarded on account of ocular complications which may cause impaired visual acuity, or, indeed, blindness. Geniculate zoster (Ramsey-Hunt syndrome) and glossopharyngeal-vagal zoster may have sequelae referable to the nerves affected.[25]

Associated with herpes zoster, a variety of paralytic accidents—Landry's paralysis, sympathetic paralysis of the deltoid and of the hand, of the third and seventh nerves—have been reported.[26] Other complications include a generalized eruption resembling chickenpox, myelitis or encephalitis, symptoms of spinal nerve degeneration.

SUMMARY AND CONCLUSIONS

In 8 cases, herpes zoster appeared in the region of injury to the skin or to the cornea, inflicted in various ways and to a variable degree, after the following intervals in days—fourteen, nine, seven, three (3 cases) and about one. In some of the patients, symptoms of sensory disturbance or pain intervened between injury and the outbreak of herpes zoster.

Review of the literature disclosed many reports of herpes zoster appearing in from one day to thirty days after injury, at times trivial, to the skin or cornea. Herpes zoster has also been reported as appearing after lumbar puncture, intramuscular injection of a medicament, osteopathic manipulation of the spine and deep roentgen therapy in the region of a ganglion.

It is therefore reasonable to believe that trauma may precipitate herpes zoster. The minimum degree of trauma and the interval between trauma and the appearance of herpes zoster in order to ascribe to trauma a causal role cannot precisely be defined. From experimental evidence and clinical observation of spontaneously occurring zoster, the incubation period of the disease ranges from a few days to about two weeks. From the cases reported in this study and from review of the literature, an interval of from one day to three weeks predominated.

1934 Spruce Street.

---

[19] This suggests a relationship of the two viruses. Whether they are distinct species or a variety of the same species is unknown. Amies (The Elementary Bodies of Herpes Zoster and Their Serologic Relationship to Those of Varicella, Brit. J. Exper. Path. **15:** 314, 1934) conducted agglutination tests with suspension of elementary bodies obtained from early vesicles of herpes zoster. Such suspension was agglutinated by the serum of several patients convalescing from herpes zoster in a dilution of 1: 128. Serum from patients with chickenpox was agglutinated in a dilution of 1: 16. Serum from 15 normal persons gave negative results.

THE PLACE OF HEALTH RESORT THERAPY IN DERMATOLOGIC DISORDERS

ANTHONY C. CIPOLLARO, M.D.
Assistant Clinical Professor of Dermatology and Syphilology, Skin and Cancer Unit, New York Post-Graduate Medical School, Columbia University
New York

Most American dermatologists, and I include myself, have had little personal experience with health resorts and their effect on diseases of the skin; there is a paucity of articles in American literature dealing with this subject. One may obtain many brochures and handbooks on health resorts distributed by chambers of commerce of foreign cities, but this type of literature is of little scientific value. Some of the more important works on the subject are listed in the bibliography.[1]

In order to evaluate the benefits which a patient with a cutaneous disorder might expect to derive from a sojourn at a health resort, I studied all the literature I could find and abstracted what I considered of value.[2] The amount was meager. There were lists of cutaneous diseases that were said to be benefited by treatment at spas, but the nature of these diseases and the reasons for referring those who had them to health resorts were not discussed.

I then wrote to a number of outstanding American dermatologists, asking their experiences and opinions regarding the place of health resorts in the treatment of dermatologic disorders. These included Drs. John Downing, Martin Engman Sr., Howard Fox, George M. Mackee, Louis Mount, Paul O'Leary, Oliver Ormsby, Richard L. Sutton Jr., Udo Wile and Fred Wise. All replied promptly and cooperated splendidly, for which I thank them.

It should be understood from the outset that ordinary cutaneous diseases are usually well managed at home by the experienced dermatologist. The cases that require further resources, and which can profitably be referred for resort therapy, are those that are chronic, recurrent, recalcitrant and generalized. Dermatoses of this type are extremely difficult to manage even in the best hospitals equipped with all necessary diagnostic and therapeutic aids. It is therefore essential that a health resort which undertakes the treatment of these resistant diseases of the skin should have a well trained and capable dermatologist in residence with a full armamentarium at his command, including an x-ray machine for therapy, ultraviolet apparatus, an electrosurgical unit and facilities for biopsies, bacteriologic and mycologic studies. Equipment for minor surgery and allergy studies (patch and scratch testing) is desirable. The details of the physical plants, the chemical constituents of the waters [3] and the surrounding terrain of American spas have been fully discussed elsewhere.

In general it may be said that the cases in which the patient will benefit most from a sojourn at a health resort are those in which change of locale, removal from physical or psychic irritants and the establishment of a scientifically regulated regimen, supplemented by treatment with therapeutic waters, can be expected to improve primarily the patient's general health and sense of well-being and secondarily his dermatosis.[4]

I shall therefore describe briefly a group of cutaneous diseases that should respond better to treatment under ideal resort conditions than to ordinary office treatment. These diseases are arranged in alphabetical order.

ACNE VULGARIS

A small percentage of cases of acne vulgaris fail to respond even to the best dermatologic treatment. An extensive variety of acne vulgaris which affects most of the back, neck and sometimes the chest is called acne cachecticorum (conglobata). It is characterized by deep pustular lesions with subcutaneous communications and the formation of cysts. The general health is usually poor, and the patients are often discouraged and depressed because of the disfigurement. Those with acne conglobata may do better at a health resort under a regulated regimen including graduated exercise, daily exposure to ultraviolet rays, midday rest in bed, properly controlled diet and internal medicaments. The quiet atmosphere, the medicated baths and an understanding personnel do much for the depressed and morose patient. Local surgical intervention, appropriate topical applications and even roentgen irradiation may be administered as indicated.

DERMATITIS EXFOLIATIVA

Exfoliative dermatitis is a serious, disabling, chronic and universal eruption. Patients with this disease are in constant discomfort from the intense pruritus, burning and fissuring. Because of the damage to the temperature-regulating function of the skin, they suffer from chills and shiver unless protected by warm clothing. Exfoliative dermatitis may be caused by the application of strong remedies for the treatment of psoriasis and other diseases or by the intake of drugs, especially arsenic; or it may be a forerunner of mycosis fungoides or leukemia cutis. Most cases, however, are of unknown cause. These idiopathic cases are generally treated by rest in bed, medicated baths, the application of soothing emollients and roentgen therapy.

It has been the practice of some dermatologists to advise patients with exfoliative dermatitis to move to a locality such as Arizona, Texas, Florida or southern California, as climatic and environmental changes have proved beneficial in a limited number of cases. Such patients might improve more satisfactorily in a place where continuous or at least frequent medicated baths could be employed.[5] Prolonged warm baths are soothing and conducive to sound sleep. Sulfur, carbon dioxide, potassium permanganate, starch, bran or tar baths give patients the greatest symptomatic relief. After the bath, the application of an emollient eases the discomfort caused by the fissures. Forced elimination with alkaline waters has a favorable effect both on the disease and on the general health of the patient. Natural or artificial heliotherapy and infra-red irradiation are useful adjuvants. Diets adjusted to individual needs, vitamins, quinine, autohemotherapy, intravenous sodium thiosulfate or calcium gluconate and roentgen

therapy may be administered as indicated by the resident dermatologist. As improvement progresses the initiation of graduated exercises, occupational therapy and diversional activities will be found beneficial.

DERMATITIS MEDICAMENTOSA

Many eruptions result from the habitual ingestion of drugs, especially those taken for constipation, nervousness and insomnia. The drugs most commonly involved in dermatitis medicamentosa are phenolphthalein, phenobarbital and the bromides. Phenolphthalein produces erythematous plaques involving multiple areas. These gradually become purplish and persist as violaceous or dark brown round or oval patches. An acute erythematous reaction occurs each time the drug is ingested. Phenobarbital may produce a rash resembling that of measles or scarlet fever; in rare instances it has caused exfoliative dermatitis. The bromides produce many types of lesions, the commonest being acneform and erythema-nodosum-like lesions which may ulcerate. Many other drugs cause eruptions, especially penicillin and the sulfonamide compounds. It is believed that any drug, with the exception of the salines, is capable of producing a dermatitis in a sensitive person.

In most instances the diagnosis is promptly made, the drug is withdrawn and the lesions subside. Patients can in most instances be relieved of the condition for which they take these drugs by treatment at a spa or health resort. The alkaline waters can do much to restore normal bowel function; and baths in the hydrotherapy pavilion, coupled with message, mild active exercise, regulation of sleeping hours and diet and the elimination of stimulating foods and excitement can do much to overcome nervousness and insomnia.

ECZEMA

Two varieties of eczema which are especially amenable to spa treatment are generalized neurodermatitis and the generalized or recalcitrant localized types of eczema seborrheicum. Other diseases of the group to be considered are dermatitis venenata, generalized nummular eczema and chronic exudative discoid and lichenoid dermatitis.

The cause of neurodermatitis is not clear. There is a familial tendency and a history of allergic manifestations in members of the family or in the patient. Endocrine and emotional factors also play a part. The disease may begin in infancy and may last with periods of remission and exacerbation through middle life. The lesions are often localized to the flexures of the elbows and knees, the sides of the neck and the ears and hands, but they may be generalized. The skin is erythematous, lichenified and sometimes fissured and exudative. The pruritus is so intolerable that the patient often spends sleepless nights. Sedatives and hospitalization are required for amelioration of symptoms.

Many patients with neurodermatitis have improved by going to the seashore in summer, where salt water bathing, sunshine, rest, good food and moderate exercise were the only therapeutic agents employed. Others have benefited by the complete change of environment obtained in Arizona, Texas, southern California or Florida. I believe that sufferers from neurodermatitis would be helped by treatment at an appropriate health resort, especially if the services of a dermatologist were available. Improvement should be noted in the general health, the psychologic and emotional status and in the cutaneous condition of the patient. Treatment at a resort has the added advantage of removing the patient from such possible environmental irritants as pollens, epidermals and dust.

Generalized and recalcitrant localized cases of neurodermatitis are particularly suitable for treatment at a health resort at which it is possible for the patient to obtain roentgen therapy, generalized ultraviolet irradiation, hemotherapy and the proper topical applications, combined with a general regimen conducive to good physical and mental health. For generalized pruriginous and exudative eruptions, nothing is more beneficial than mildly antiseptic baths. Continuous medicated baths with mechanical regulation of the temperature and the concentration of the solution are especially desirable and are available at some health resorts. Regular and graduated exercise, occupational therapy, attention to bowel function, ingestion of large quantities of alkaline waters, menus adjusted to each particular patient, midday rest and diversional activities afford much help to the sufferer who has had no relief night or day from the torment of long-continued extensive pruritic eruptions.

Eczema seborrheicum is thought to be caused by the Pityrosporum ovale in sensitized subjects, but in most instances the cause is not known. The disease occurs as greasy, scaly patches of dermatitis affecting principally the scalp, face, interscapular region and sternum. The hairy parts all over the body, including the eyelashes, eyebrows and the hairs in the nose may be affected. Exceptionally, patients with this disorder may show lesions all over the body and the eruption may be exudative. These generalized infections are particularly recalcitrant and some temporary relief is obtained only when hospitalized. Some patients with recurrent generalized seborrheic dermatitis need a change of environment and climate. Continuous medicated baths, especially with sulfur or tar, are beneficial, and proper rest, diet and exercise are better regulated at a well organized health resort than at home. Natural heliotherapy combined with mental rest and relaxation often improve the patient's condition in stubborn cases of extensive seborrheic dermatitis.

Other eczematous eruptions such as dermatitis venenata and generalized nummular eczema are amenable to treatment at health resorts. Most cases of contact dermatitis are easily detected and easily cured, but there are some in which the most careful search for the cause of the infection is fruitless. When patients with intractable contact dermatitis are transferred to the controlled environment of a spa the lesions are apt to disappear, and hence the chances for discovering the cause of the disease are increased. Continued nervous tension or an emotional upset may precipitate an attack of nummular eczema, so that treatment at a health resort directed both to the nervous system and the skin is beneficial also from this point of view.

Many of the patients who occupy beds in dermatologic wards are suffering from chronic exudative discoid and lichenoid dermatitis. There is a strong psychoneurotic element in every patient with this form of recurrent chronic dermatitis, which principally affects men who are emotionally unstable and whose financial status is uncertain. These patients suffer a great deal and are unable to work. The lesions, which cover practically the entire body, consist of small, discrete papules, some of them grouped. In places the eruption is papulovesicular. There are intense pruritus, excoriations and exudation. Under hospital care the condition improves, but it recurs promptly under the stress and strain of ordinary activity. A change of environment, a carefully selected regimen of rest and diet, exercise in the open air, and the stimulating and tonic effects of hydrotherapy, heliotherapy and directed diversions are beneficial to patients with chronic exudative discoid and lichenoid dermatitis. Such treatment is of special value in improving the psychologic outlook of the patient and in fact is probably the only kind that may have lasting effects.

FURUNCULOSIS

The ordinary furuncle can be managed adequately by any physician. However, there are some cases in which lesions are scattered all over the body; as soon as one resolves another develops, and this goes on for many months with occasional remissions. Chronic recurrent multiple furunculosis should respond well to a controlled environment and a well regulated regimen. Prolonged and frequent medicated baths containing sulfur are beneficial and easily obtained at a spa. Autohemotherapy, vaccine, bacteriophage, penicillin and other antibiotics, roentgen rays, ultraviolet rays, vitamins and natural alkaline waters can all be administered expediently at a health resort. A careful medical check-up to rule out diabetes, anemia, foci of infection and other provocative causes is essential to the proper management of all cases of chronic recurrent multiple furunculosis.

HERPES ZOSTER

Neuralgia may persist for months after the cutaneous lesions of herpes zoster have resolved. This painful disease limits normal function, and treatment at a health resort should do much to shorten its duration. Ingestion of the natural waters, carbonic acid or sulfur baths, occupational and infrared therapy, rest, exercise, proper diet and a well regulated life should hasten recovery. Treatment with roentgen rays, sodium iodide, thiamine hydrochloride or posterior pituitary injection may be carried out if indicated in any resort properly equipped to treat all types of cutaneous disease.

LICHEN PLANUS

Lichen planus is a disease characterized by the development of papules affecting the flexor surfaces of the forearms, arms, legs and, occasionally, the glans penis and mucous membranes of the mouth. The disease is usually localized but may be generalized. The papules are pinhead to pea sized, flat topped, umbilicated and polygonal. They are violaceous, and the pruritus is at times intense. The cause is not definitely known, but the disease usually occurs in patients of a nervous temperament. Overwork, nervous shock, worry, anxiety and fatigue are significant factors. It is usually acute, runs its course of about six weeks and terminates forever. A few cases are chronic and recurrent.

Most of the chronic recurrent lesions are controlled by treatment with roentgen rays and injections of a bismuth preparation. Some patients do better when the environment is changed. Treatment at a health resort should be beneficial, especially for highly tense patients. Most of the cases would probably clear up spontaneously under regular spa regimen without the necessity of special dermatologic therapy.

NEUROSES OF THE SKIN

Hyperesthesia, dermatalgia, meralgia paresthetica and erythromelalgia are caused by some disorder of the nervous system. In most instances hysteria, neuroses and functional disturbances of the central nervous system are responsible. Occasionally these peculiar cutaneous reactions are due to central organic disease. If the cause is functional, improvement should follow treatment at a spa or health resort. Hydrotherapy, sulfur or carbon dioxide baths, generalized ultraviolet irradiation, occupational therapy, diversional activities, supervised and graduated exercise, regulated sleep, elimination of all stimulants and an individualized diet fortified with vitamin B tend to improve the general health and should clear up these cutaneous neuroses.

PRURITUS

Pruritus is a symptom. Most itchy dermatoses, and especially the parasitic diseases, do not need the special treatment afforded by health resorts. Patients suffering from idiopathic types of pruritus, such as senile and essential pruritus and even those with some types of pruritus caused by disturbances of the liver and gallbladder may be greatly relieved by such treatment. Elderly persons who suffer from senile pruritus, due no doubt to atrophic changes in the skin, are restless and irritable most of the time, and much sleep is lost because of the constant itching. The regulated life at a health resort with proper emphasis on graduated exercise, medicated baths, steaming, massage and attention to bowels and diet should do much to relieve the pruritus and induce normal sleep. In all cases of essential generalized pruritus every effort should be made to find the cause, and a careful general medical check-up of the patient is the first step to be taken.

PSORIASIS

Psoriasis is a chronic inflammatory disease which tends to recur. Remissions following treatment may occasionally last for years. The disease usually occurs in otherwise normal persons and is characterized by variously sized, rounded, marginated, erythematous patches with thick, micaceous scales, situated principally on the elbows and knees, scalp and nails. Most patients, however, have lesions all over the body, and in a few instances the eruption is universal, simulating exfoliative dermatitis. The cause is unknown, although it is sometimes associated with arthritis. The disease is influenced by diet, rest, climate and other environmental factors.

There is no specific treatment for psoriasis. Severe cases may clear up under the influence of ultraviolet rays in a mild climate such as that of Florida, southern California and the near tropic regions. It also seems to resolve in temperate zones when patients avail themselves of natural sunshine at the seashore or at high altitudes. It has been the observation of many dermatologists that when psoriasis clears up under natural influences, such as sunshine and climate, the remissions are apt to be prolonged. A health resort, especially one situated in a favorable climate, has much to offer the patient with psoriasis. The natural sulfur and carbon dioxide baths are especially efficacious in removing thick scales so that topical applications can more easily reach the inflammatory process. Hydrotherapy and massage are other useful adjuvants in the treatment of psoriasis. Alkaline waters increase kidney and bowel elimination, with beneficial effect on the general health. Diet can be carefully regulated. A low fat diet is most favored today. In the past protein-free diets were recommended, and there are still a few dermatologists who adhere to this practice. A health resort with a dermatologist in residence can carry out other methods of treatment if indicated, such as roentgen irradiation, administration of vitamins and arsenic preparations, hemotherapy and the Goeckerman treatment. There is no question in my mind that recalcitrant generalized cases of psoriasis can best be treated at a health resort situated in a favorable climate and equipped to treat dermatologic diseases.

TUBERCULOSIS

The manifestations of cutaneous tuberculosis are many and differ greatly. Forms of tuberculosis which are suitable for treatment at a health resort or spa are lupus vulgaris, tuberculosis verrucosa cutis, scrofuloderma, erythema induratum of Bazin, and papulonecrotic tuberculid. Active pulmonary tuberculosis is uncommon in persons with tuberculoderma. Erythema nodosum will be included in this group because some instances of this disease are caused by Mycobacterium tuberculosis, although other bacteria, especially the streptococci, are responsible.

In addition to local measures, all forms of cutaneous tuberculosis require systemic treatment aimed at improving the general health of the patient. Regular sleeping hours including midday rest, a diet rich in vitamins and high in proteins and calories, good hygiene, regulated exercise and the administration of liver extract are helpful in increasing resistance to Myco. tuberculosis. Intense daily local irradiation and mild generalized irradiation with natural or artificial ultraviolet rays are extremely beneficial. Treatment with tuberculin, gold salts, roentgen rays, carbon dioxide refrigeration and other methods can be carried out at the discretion of the resident dermatologist. Tuberculodermas run a chronic course, and treatment at a properly equipped spa or health resort should hasten resolution.

ULCERS

Specific ulcers caused by tuberculosis, syphilis, cancer, microaerophilic hemolytic streptococci, certain fungi, malingering and other causes will be excluded from consideration. I shall confine my remarks to chronic ulcers of the leg and ulcers from third degree burns that are extremely slow in healing. These lesions are substantially helped by hydrotherapy, massage, regulated exercise, proper rest and diet and other measures that would improve the general health and the peripheral circulation of the patient, such as carbon dioxide baths, heliotherapy, vitamins and alkaline waters for improved elimination. Such treatment as elevation of the affected parts, support of the circulation with gelatin or elastic bandages, acetyl-beta-methylcholine (Mecholyl) bromide iontophoresis and proper topical applications should be carried out along with general resort treatment.

URTICARIA

The acute type of urticaria that follows the ingestion of some food to which the patient is sensitized lasts only a few days and is entirely cured with a cathartic and the injection of a few minims of epinephrine.

Chronic urticaria is one of the most difficult diseases to treat, because its cause is obscure. In some instances, chronic urticaria is caused by food, in others by an infectious focus. Most cases of idiopathic chronic urticaria occur in highly emotional subjects, and excitement, worry, a catastrophe, fatigue and similar factors will precipitate an attack.

Since there is no specific treatment for chronic urticaria, change of environment and regular treatment at a spa should be of service. Its facilities for exercise, hydrotherapy, rest, diet, elimination of stimulating foods and drinks and the use of diversional activities and occupational therapy should be employed. The response to such treatment is often immediate, and the improvement in general health and the resultant mental relaxation should give the patient a long and perhaps permanent respite from symptoms.

VASCULAR DISEASES

Certain vascular diseases such as Raynaud's disease, pernio (chilblains), sclerodactylia and scleroderma are benefited by climatic conditions. Patients with these disorders do not tolerate cold weather well. At a health resort located in a warm climate and possessing adequate facilities for medical treatment, patients with vascular diseases can be made more comfortable and their life prolonged.

COMMENT

It is worth while to emphasize the fact that a hotel[6] at the seashore or at the mountains, equipped with hydrotherapy apparatus and a solarium, is not a health resort and is useless for the treatment of cutaneous diseases. The comprehensive, supervised regimen, supplemented by specialized treatments as described, can be undertaken only at an establishment designed and equipped solely for therapeutic purposes.

It is important to mention radium waters. Roentgen rays and radium rays—applied externally—are valuable in the treatment of many diseases of the skin and in fact constitute the most important modalities in the armamentarium of the dermatologist. But because they are highly potent agents they must be administered with great caution in accurate dosage and under expert supervision. The efficacy of radium waters has never been proved. Bathing in waters which contain therapeutically effective quantities of radioactive substances is dangerous, in my opinion, and drinking them is even more to be condemned. Radioactive substances absorbed through the skin or taken internally, even in minute doses, have a cumulative effect which can cause degenerative changes and even death. The use of radium waters should be discouraged for the treatment of cutaneous diseases.

The chemistry, physiology and metabolism of the skin have not been discussed in this paper, since material on these subjects is available in standard books on dermatology and in a book by Markovitz.[7]

SUMMARY

1. Patients suffering from diseases of the skin are as a rule ambulatory and can avail themselves fully of the natural advantages, general regimen and specialized treatments available at the well equipped spa.

2. Natural waters alone are not adequate for the treatment of cutaneous disorders. Spring waters coupled with a health resort regimen and adequate medical services are of inestimable value.

---

6. Rules for the Listing of American Health Resorts, Committee on Health Resorts, J. A. M. A. **118**: 379 (Jan. 31) 1942.

7. Markovitz, M.: Chemistry and Metabolism of the Skin, Philadelphia, The Blakiston Company, 1942.

3. It is necessary to add to the health resort regimen the services of a qualified dermatologist and the facilities required for the treatment of cutaneous diseases.

4. There are a number of diseases of the skin which should prove amenable to treatment at an approved spa. It is my belief that most patients with these diseases will derive immense benefit from proper treatment at a health resort.

5. To bathe in or to drink radioactive or radium waters is of unknown efficacy and may be a dangerous practice. It is not recommended for the treatment of any cutaneous disease.

40 East Sixty-First Street, New York 21.

Clinical Notes, Suggestions and New Instruments

PAROXYSMAL HYPERTENSION FROM PHEOCHROMOCYTOMAS

ALEXANDER BRUNSCHWIG, M.D.
Chicago

In recent years the several published studies of paroxysmal hypertension due to pheochromocytoma of the adrenal gland have well established this clinicopathologic entity.[1] The generally accepted treatment of such neoplasms is excision, usually with the entire adrenal gland which is the site of the tumor.

Summaries of Blood Pressure Readings Before and After Excision of Pheochromocytomas

Case	Sex	Age	History	Blood Pressure During Typical Attack of Paroxysmal Hypertension	Operation	Subsequent Course
1	♀	41	Attacks of dyspnea and asthenia, increasing in frequency during previous 8 years; finally one attack a day; normal blood pressure 138/96	220/130	4/21/37, excision of left adrenal with pheochromocytoma, 6 × 4 cm.	Well during 10 year period following operation; no recurrent attacks; blood pressure 130/90
2	♀	35	Severe attacks of headache, nausea and vomiting, tremor, clonic movements, blurred vision and sometimes syncope with expectoration of red frothy fluid for 3 years; normal blood pressure 140/90	240/140 (frequent attacks each day)	2/21/42, excision of right adrenal with pheochromocytoma, 6 × 5 cm.	No recurrence of attacks during 5 year period following operation; blood pressure 98/64
3	♀	?	One severe near-fatal attack of syncope; during recovery had pronounced pulmonary edema; normal blood pressure 140/85	295/155 (only attack observed preoperatively)	5/9/39, excision of right adrenal with tumor measuring 3.5 × 3 cm.	For months after operation blood pressure was 140-150/75-84; however, patient died 2½ years after operation, of "multiple sclerosis," in another institution; prior to death there were no further attacks of hypertension
4*	♀	20	No typical "attacks" usually associated with paroxysmal hypertension, but her physician noted that blood pressure which was usually 120/75 would rise on frequent occasions to 190/110; diabetes mellitus developed, also excess growth of hair on breasts and abdomen	190/110	7/24/44, excision of right adrenal with tumor measuring 5 × 3 cm.	Generally satisfactory; diabetes has not improved; blood pressure 122/92 (now stable); no change in distribution of hair

* Patient of Drs. W. E. Adams and Martin Goldner.

The purpose of this report is to record the blood pressures and ultimate courses in a limited series of patients in whom excision of pheochromocytoma for paroxysmal hypertension was performed by me. These operations were performed via the anterior or abdominal route.[2] The pertinent facts are summarized in the accompanying table.

The fifth patient to be included in this report is a white woman aged 39, who had been under the care of Dr. Rudolph Hennemeyer (Chicago) for several years. Blood pressure readings were often observed to be approximately 90 systolic and 60 diastolic, but on the occasion of a routine visit the blood pressure was observed to be 300 systolic and 150 diastolic without accompanying symptoms. Because of this apparent and sudden elevation in blood pressure hospitalization was advised immediately (Sept. 7, 1940). The patient was bled with little reduction in pressure. Roentgenograms revealed a calcareous ring about 6 cm. in diameter in the region of the left adrenal gland. This was interpreted as partial calcification in an adrenal tumor (possibly pheochromocytoma). The day after admission a left hemiplegia developed suddenly, due undoubtedly to a cerebral hemorrhage. In view of the persistent high blood pressure I performed a laparotomy on Sept. 11, 1940, and a cystic tumor measuring 4.5 by 3.5 by 3 cm. and arising in the left adrenal gland was removed together with the gland. Subsequent to excision the blood pressure could not at first be obtained but a short time later returned to 150 systolic and 70 diastolic.

Study of the specimen showed the cyst to be composed of a fibrous wall in which a thin calcareous shell was present (fig. 1). The fluid content was yellow, turbid, mucoid in nature and measured 24 cc. in volume (fig. 2). Over the surface of the cyst were thinned out segments of adrenal parenchyma. Microscopic study showed that the cyst wall was fibrous and that there was no lining of epithelial cells.

Chemical analysis of the fluid from the cyst revealed: nonprotein nitrogen 46.2 mg., total nitrogen 0.93 Gm., and total protein 5.5 mg., per hundred cubic centimeters; chlorides 107 millimols per liter and glucose 134 mg. per hundred cubic centimeters.

In the months after the surgical operation there was some improvement in the hemiplegia, but the blood pressure gradually rose to a systolic range of 230 to 190 and a diastolic level of 120. In the winter of 1946 a Smithwick bilateral sympathectomy was performed without lowering the blood pressure, which varies now between 210 systolic and 140 diastolic and 180 systolic and 120 diastolic. Urinalysis is negative.

COMMENT

Removal of a pheochromocytoma which produces paroxysmal hypertension is apparently followed by permanent return of the blood pressure to normal levels, and there appear to be no permanent ill effects from the several attacks of hypertension engendered. Nor, from the limited series of patients observed, does there appear to be a danger of other untoward sequelae developing at a later period. The development of "multiple sclerosis" after the surgical operation in case 3 would seem to be coincidental. Case 4 presents three interesting features; namely, the absence of subjective symptoms related to the paroxysmal attacks of hypertension, the presence of diabetes mellitus both before and after excision of the tumor and the development of hirsutism, also not affected by removal of the tumor.

From the Department of Surgery, University of Chicago.

This study was aided by the Chas. H. and Mary F. S. Worcester Fund, University of Chicago.

[1] Brunschwig, A.; Humphreys, E., and Roome, N.: The Relief of Paroxysmal Hypertension by Excision of Pheochromocytoma, Surgery 4:361, 1938.

[2] Brunschwig, A., and Humphreys, E.: Excision of Pheochromocytoma Following Near Fatal Attack of Paroxysmal Hypertension, J. A. M. A. **115**:355 (Aug. 3) 1940. Brunschwig, Humphreys and Roome.[1]

Cysts of the adrenal are rare I have not been able to find records of a cyst similar to the one previously described (case 5). Its etiology remains obscure. There is no evidence to support the view that it represents an organized hemorrhage in the gland. Cystic tumors of the adrenal, but of different types, have been reported by H Winter [3] (cystic lymphangioma) and Menon [4] (hemangioblastoma). The relationship, if any, between the sudden onset of sustained hypertension and the presence of the adrenal cyst in the case described herein remains obscure

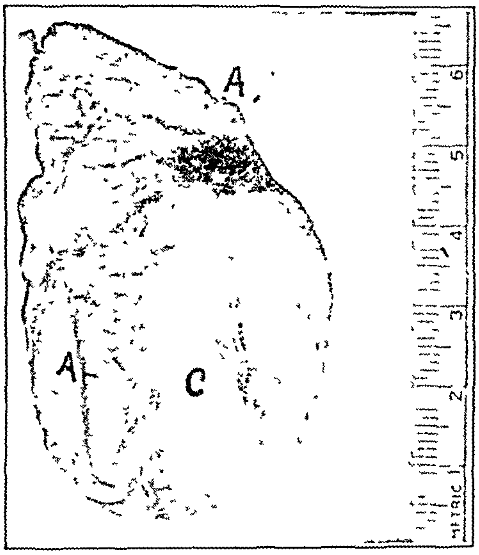

Fig 1.—Photograph of cyst (*C*) of right adrenal gland showing (*A*) portion of the adrenal gland about the cyst wall.

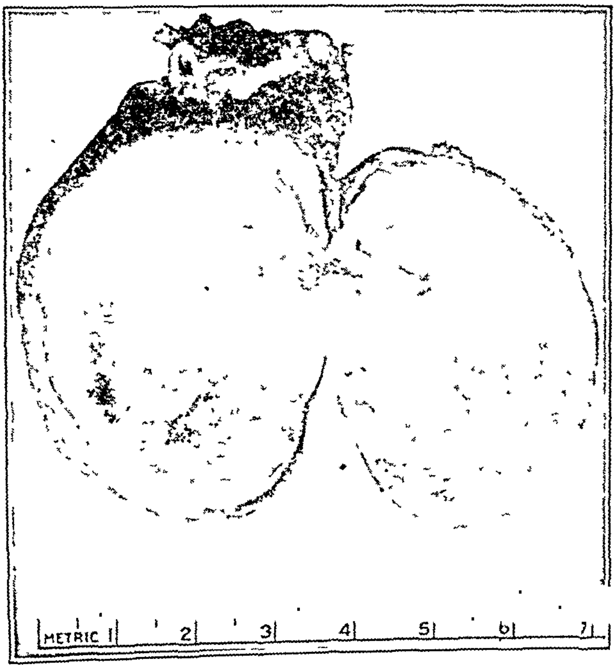

Fig 2.—The opened cyst with white mottling due to calcification throughout most of the wall Twenty four cubic centimeters of mucoid turbid yellowish fluid were evacuated and analyzed

SUMMARY

Four patients from whom pheochromocytomas of the adrenal gland were removed and in whom there were associated attacks of paroxysmal hypertension, were followed for ten, five, two and a half and two and a half years No recurrences of hypertension were observed, and other ill effects were not observed to develop subsequently which might be ascribed to the tumors or the paroxysmal hypertension.

One instance of calcified adrenal cyst associated with the sudden onset of sustained hypertension is also recorded The hypertension has persisted for six years and three months after removal of the cyst and involved adrenal gland, but there is no evidence that this tumor was the etiologic factor in the hypertension.

Council on Physical Medicine

The Council on Physical Medicine has authorized publication of the following report HOWARD A CARTER, *Secretary.*

UNEX HEARING AID MODEL A ACCEPTABLE

Manufacturer. Nichols and Clark, Hathorne, Mass

This instrument is self contained, the batteries being inserted in the back of the case The case is of pressed metal in three pieces, assembled with Phillips screws The back cover snaps on The case tapers in thickness from the center to both ends and has rounded ends Wearing clips are on the sides of the case Two controls are placed at the top end of the case, one a volume control and the other a combination "on-off" and three-position tone switch One receiver, a crystal type, was supplied.

Unex Hearing Aid, Model A

Dimensions and Weight

Single unit with batteries weight 6 ounces (170 Gm), length 5½ inches (14.0 cm), thickness 1¼₁₆ inches (3.1 cm), width 2½ inches (6.4 cm).

Battery Data	Measured Voltage	Measured Current
A 1½ volts	1.4 volts	55 milliamperes
B 22½ volts	21 volts	0.65 milliampere

Acoustical Gain

Measurements of the gain in decibels in the sound pressure level referred to 0.0002 dyne/sq cm attached to a 2 cc coupler over the pressure levels at the microphone were made at nineteen frequencies between 200 and 4,096 cycles, with the input level set at 0.02 dyne/sq cm *The following figures are typical* of the gains in decibels when the volume control was set full on.

Frequency ..	256	512	1,024	1,200	2,250	3,100	4,096 cycles
Tone controls							
"1 dot"	42.5	40.5	43.0	46.5	33.5	37.0	35.0 db
"3 dots" .	24.0	37.0	45.0	50.0	39.0	40.0	41.0 db

Approximate values of maximum pressure levels, at four frequencies, observed on a 2 cc coupler with volume control set at full gain for the "two dot" tone setting:

Frequency	Input Level	Maximum Output Level
600 cycles	60 decibels	100 decibels
1,024 cycles	60 decibels	106 decibels
1,200 cycles	70 decibels	109 decibels
2,048 cycles	70 decibels	93 decibels

Intelligibility tests were made with a normal hearing person so placed that the speaker could barely be heard with the hearing aid turned off. These tests indicated satisfactory performance.

It will be noted that the maximum gain obtained is somewhat lower than indicated in data supplied by the manufacturer. This may be accounted for by a difference in measuring technics The manufacturer's data were computed from response curves of individual components of the hearing aid.

The Council on Physical Medicine voted to include the Unex Hearing Aid, Model A, in its list of accepted devices.

EXAMINING BOARDS IN THE MEDICAL SPECIALTIES 288

Statistical compilations regarding medical licensure are presented annually in the State Board Number of THE JOURNAL. In the following pages will be found the report for the year 1946, which constitutes the forty-fifth annual presentation. Data are included pertaining to (*a*) medical examining and licensing boards of the United States, the District of Columbia, the territories and possessions of the United States, (*b*) boards of examiners in the basic sciences, (*c*) the National Board of Medical Examiners and (*d*) examining boards in the medical specialties.

The computations presented are based on official records received throughout the year from the medical examining and licensing agencies of all states, Alaska, Hawaii, Puerto Rico and the Virgin Islands; the nineteen boards of examiners in the basic sciences; the fifteen approved examining boards in the medical specialties; the National Board of Medical Examiners, and the homeopathic medical licensing boards of Connecticut, Delaware, Maryland and Louisiana.

The State Board Number of THE JOURNAL is made possible because of the wholehearted cooperation of all concerned with supplying this information. The Council and THE JOURNAL express their appreciation to those who have supplied these data and for other records furnished throughout the year.

The tables referring to medical licensing boards include figures for the number of candidates examined for medical licensure in 1946, the numbers licensed and the number who secured their first medical license and therefore represent additions to the medical profession. The state boards are discussed first, followed by the basic science boards, the National Board of Medical Examiners and the examining boards in the medical specialties.

STATE BOARDS OF MEDICAL EXAMINERS

LICENSES ISSUED

During the year 1946 there were 16,129 licenses to practice medicine issued by the medical examining boards of the forty-eight states, the District of Columbia, Alaska, Hawaii, Puerto Rico and the Virgin Islands. The number licensed in each state, by examination or by the endorsement of credentials, is shown in table 1. Of the 16,129 licenses issued, 6,559 were granted after examination and 9,570 by reciprocity and

endorsement of state licenses or the certificate of the National Board of Medical Examiners. These figures represent an unprecedented increase over all previous years in both groups.

The greatest number of licenses during the last calendar year were issued in California, 2,045. Both New York and Illinois licensed more than 1,000. Five other states registered over 500; Michigan, New Jersey, Ohio, Pennsylvania and Texas. No state licensed fewer than 30. Comparison of like data presented for the year 1945[1] indicates an increase in all but three states: Arkansas, Indiana and Tennessee. The increase was spectacular not only in certain states with large urban populations but also in some rural states. Twelve instances are cited indicating the state and the number licensed in 1945 as compared with the year 1946:

	1945	1946
Alabama	85	179
Arizona	32	100
Maine	21	91
Mississippi	70	134
Montana	13	74
New Hampshire	25	124
North Dakota	8	30
Oregon	61	201
Virginia	83	403
Washington	87	294
West Virginia	37	164
Wyoming	6	38

While the more pronounced increase was evident in the group licensed without examination, the group who were registered after written examination was more than 1,000 greater than in 1945. These figures apparently *reflect mainly* the migration of veteran medical officers who are not returning to their original state of practice and those medical officers representing recent graduates who were licensed prior to entry on active duty with the armed forces but returned to a new state. Previous compilations indicated that the accelerated program in medical schools (July 1, 1942 to July 1, 1945) produced 20,662 physicians in this three year cycle, while in the four years 1942 to 1945 inclusive 35,821 physicians received licenses. The graduation of one extra class under the accelerated program and the slight increase in enrolment in all medical schools, while intended primarily for the production of additional physicians to aid in the care of the armed forces, is now probably providing a greater physician-civilian population ratio in the country generally.

However, the figures presented in this table, particularly in the endorsement group, do not represent entirely individuals but include persons who may have been licensed in more than one state during a given year; nor does the total represent additions to the medical profession, since a physician previously licensed in one state may be licensed by examination in a nonreciprocating state. In tables 12, 13 and 14 (see pages 271 and 272) can be noted the number who secured licenses for the first time and represent additions to the medical profession in the United States and its territories and possessions.

Totals for eleven previous years and for 1946 by all methods of licensure are shown for comparison in table 3. *The high figures for the years from 1936 to 1941* in the annual number of licenses issued were

due to the licensure of foreign graduates. In succeeding years the accelerated program in medical schools increased the numbers annually licensed, the high for this period as for previous years being 1944, when 9,652 were licensed. This figure was surpassed in 1946 by 6,477. In 1946 there were 1,015 more licenses issued after examination than in 1945 and 5,955 more by endorsement of credentials.

TABLE 3.—*Licenses Issued, 1935-1946*

	Examination	Reciprocity and Endorsement	Total
1935	5,725	2,194	7,919
1936	6,275	2,772	9,047

1945	5,544	3,615	9,159
1946	6,559	9,570	16,129
Totals	75,293	40,210	115,503

It does not follow that all physicians certified in a given year after examination were tested in that year. In twenty-three states, the District of Columbia, Alaska, the Canal Zone, Hawaii and Puerto Rico the internship is a requisite for practice, but in some of them a physician is permitted to take an examination before completion of the internship; if the examination is successful, the license is withheld until completion of the internship. Licenses are also withheld in some states for proof of citizenship and other technicalities. In other instances the licenses of those examined in December are dated and issued in the following year. The statistics in table 1, therefore, include some persons who were examined late in 1945, and even a few in previous years. Consequently, figures in this table will not entirely correspond with those of later tables which deal with physicians examined for medical licensure in 1946.

CANDIDATES EXAMINED BY MEDICAL EXAMINING BOARDS

In table 2 are recorded figures referring to those examined for medical licensure in 1946 by individual states, the District of Columbia, Alaska, Hawaii and Puerto Rico, indicating the numbers who passed and failed in each state, the medical school of graduation, the percentage of failures by schools and the number of states in which graduates of a given school were examined. Medical schools in the United States which are no longer in existence, foreign faculties of medicine and unapproved schools are not listed by name, but the numbers examined in each state in these three categories are indicated at the bottom of the table.

Throughout the year 7,605 were examined, of whom 6,853 passed and 752 failed. Candidates represented sixty-nine approved medical schools in the United States, nine approved medical schools of Canada, eighty-six faculties of medicine and four licensing corporations of other countries, eight medical schools now extinct, six unapproved institutions and seven schools of osteopathy. Osteopaths who were granted the privilege to practice medicine, surgery or both by the medical examining boards are included in these statistics. Osteopaths in other states who obtained the legal right to special practice by the osteopathic board are excluded from these compilations.

Examination dates and reciprocity meetings were scheduled at more frequent times by many states in order to facilitate the physicians to commence the practice of medicine at an earlier date. Executive officers and members of examining boards are to be commended for thus assisting medical officers and others. This cooperation, in view of the increase in volume of applications, is noteworthy.

TABLE 5.—*Source of Candidates Examined for Licensure in the United States, 1946*

Medical Schools	Number of Schools	Number Examined	Number Passed	Number Failed	Percentage Failed
Approved in United States	69	6,288	6,090	198	3.1
Approved in Canada	9	135	118	17	12.6
Extinct	8	68	63	5	7.3
Foreign	90	494	220	274	55.5
Unapproved schools	13	620	362	258	41.6
Totals	188	7,605	6,853	752	9.9

The 7,605 examinees represented 6,288 graduates of approved medical schools in the United States, of whom 3.1 per cent failed; 135 graduates of approved Canadian schools, 12.6 per cent failures; 68 who graduated from medical schools no longer operating, with 7.3 per cent failures; 494 graduates of faculties of medicine located in countries other than the United States and Canada, 55.5 per cent of whom failed, and 620 graduates of unapproved institutions, with 41.6 per cent failures. The numbers examined in each of these categories were in excess of those examined in 1945. The majority of physicians in the classification of extinct medical schools were graduates of Rush Medical College. Massachusetts, which in former years was compelled by law to license any person applying for licensure and as a result tested the great majority of graduates of unapproved schools in previous years, examined fewer in 1946. The state approving authority in Massachusetts, created some years ago, has ruled that only those graduates who matriculated in medical schools not acceptable to that body prior to Jan. 1, 1941 will be eligible for licensure examinations in the future. Legislation passed in New York, Ohio and Virginia accounts for the increase in the total number of graduates of unapproved schools tested for licensure.

As in table 1, the 7,605 physicians and others examined for medical licensure do not represent an equal number of individuals, since a candidate might take an examination in more than one state and is counted in each state. However, if a candidate fails more than once in a given state within the year he is counted in that state as only one failure.

The greatest number of graduates of any one school examined was 348, representing the University of Illinois College of Medicine, 281 of whom were examined in Illinois and 67 in eighteen other states. More than 175 graduates of four other schools applied for licenses by examination last year, namely Northwestern University (262) in twenty-nine states, University of Minnesota (223) in fifteen states, University of Louisville (184) also in fifteen states, and Hahnemann Medical College (181) in twenty-two states. One hundred or more graduates of seventeen other schools also were tested during the year.

Thirteen approved schools in the United States had no failures before medical licensing boards, thirty-five less than 5 per cent and fourteen between 5 and 10 per cent. There were seven schools with 10 per cent or more failures in state examinations. The highest percentage of failures for any one school (with relatively few examined) was 31.6. These failure figures and percentages are modified by data on those who were examined by the National Board of Medical Examiners in its final examinations as well as those passing state tests (table 6, page 261).

The Medical College of Alabama, which has developed an approved four year program and graduated its first class in October 1946, had none of its graduates appear before licensing boards in 1946.

Three of the five homeopathic boards in existence examined 10 candidates: Connecticut 5, Delaware 4 and Maryland 1. The homeopathic and eclectic boards in Arkansas did not examine any one in 1946, while the homeopathic board in Louisiana registered only by reciprocity.

Graduates of the University of Pennsylvania were examined in the greatest number of states, thirty. Northwestern alumni were tested in twenty-nine states and Harvard Medical School in twenty-eight states. All other schools had their graduates examined in fewer than twenty-six states. Eight schools had graduates examined *in fewer than five states.* All the graduates of Southwestern Medical College examined (33) were tested in Texas.

A total of 135 graduates of the nine approved medical schools in Canada appeared for licensure in the United States in 1946 in twenty-seven states. The figures for individual states are given by schools in table 1 and by totals in table 4. Of the 135 examinees, 17 (12.6 per cent) failed. New York examined 31, Maine 15, California 11 and all other states fewer than 10. The highest percentage of failures was 37.5, in New York. Three Canadian schools had no failures before United States licensing boards. The lowest failure percentage was 4.8. The remaining schools had percentages higher than 8.

Graduates of osteopathic schools were examined by the medical boards of Colorado, Connecticut, Delaware, Indiana, Massachusetts, Nebraska, New Jersey, New York, Ohio, Oregon, Texas, Virginia and Wisconsin, while graduates of unapproved schools were examined in Florida, Illinois, Iowa, Massachusetts, Mississippi, New York, Ohio, Virginia and Washington. There were 620 graduates of unapproved and osteopathic schools, of whom 362 passed and 258, or 41.6 per cent, failed. The numbers of successful candidates in each of these two categories can be ascertained by reference to tables 24 and 25, page 277.

Graduates of faculties of medicine of other countries were examined in twenty-two states. There were 494 such graduates, with 274 (55.5 per cent) failures.

Sixty-eight graduates of medical schools no longer in operation were tested in twenty-four states, of whom 63 passed and 5 (7.3 per cent) failed.

In all five categories mentioned, 7,605 appeared before medical examining boards in 1946, of whom 6,853 passed and 752, or 9.9 per cent, failed. The number tested exceeded the 1945 figure by 1,015.

Totals for the five categories are given in table 5. As already mentioned, from the United States approved schools there were 3.1 per cent who failed, as did 12.6 per cent of the Canadian graduates and 7.3 per cent representing extinct schools. The greatest percentage of failures represented two groups, foreign schools and unapproved schools. In these two groups 55.5 and 41.6 per cent respectively failed.

Elsewhere (see table 12, page 271) are given figures referring to actual licentiates and additions to the medical profession.

CONSOLIDATED EXAMINATIONS

A combination of the individual school results for the two groups appearing for the state medical board examinations and for part III of the examinations of the National Board of Medical Examiners is given in table 6. This table presents a more accurate picture of the performance of physicians in licensure examinations than is given in the preceding tables. It can be noted that in some instances schools having a high percentage of failures before state licensing boards had few, if any, failures before the National Board. In 1946 there were 6,288 graduates of approved medical schools in the United States examined by state boards, of whom 198, or 3.1 per cent, failed. In the same period 1,588 graduates of these institutions appeared for part III of the examination of the National Board, of whom 21, or 1.3 per cent, failed. In the consolidated figures the failures from approved medical schools in the United States were 2.8 per cent.

Of the Canadian graduates 12.6 per cent failed state board tests and 10.1 per cent failed the combined tests. Only 3 graduates of extinct approved medical schools and 7 graduates of foreign medical schools were tested by the National Board; no comparison can be made of these two groups with similar groups examined by state licensing boards. The National Board does not admit to its examinations the graduates of unapproved medical schools in the United States, and from foreign schools it admits only the graduates of the university medical schools of Great Britain and Ireland, provided these graduates have been licensed to practice in the country in which the school attended is located.

The total of all examined before medical licensing boards in the United States in 1946 was 7,605, of whom 6,853 passed and 752, or 9.9 per cent, failed. For both groups—state boards and the National Board—9,237 were examined; 8,464 passed and 773 (8.4 per cent) failed. The total percentage of failures was not greatly

reduced because of the high percentage of failures before state boards by unapproved and foreign graduates. Sixty approved schools in the United States and 6 in Canada were represented in the National Board examinations.

FAILURES

Data recorded in table 7 refer to failures before medical licensing boards by licentiates of 1946. The United States is divided into two groups—the thirty states and the District of Columbia in which approved four year medical schools are located and those states and territories and possessions which have no medical school within their boundaries. Included is the number who failed state board examinations and were graduates of a medical school located in the state in which they were examined and, for comparison, the number of graduates licensed in a given state who obtained their professional training in schools in other states.

Practically all states require the applicant to receive a general average of 75 per cent and at least 50 per cent in any one subject. In case of failure in not more than two subjects the applicant is entitled to another examination in those subjects within twelve months. A few states consider such individuals as conditioned in the subjects in which they fail and do not report them to the office of the Council on Medical Education and Hospitals as failures. In these instances they are not considered in the calculations in this study. When their grades are raised after a successful test in the subjects in which they failed they are recorded among those who passed.

Forty-nine physicians failed examinations in the state in which they obtained their professional training. This occurred in eleven states. Twenty-seven failed in New York State. Eleven states also reported 82 failures among students who graduated from approved medical schools located in states other than the one in which they were examined. Again, New York reported the greatest number, 57. Massachusetts reported 1 failure from its own schools and nine from twenty-four other schools, 14.8 per cent. Eighteen states reported no failures during the year from graduates of schools located in these states, and twenty states had no failures among graduates of schools in other states. Fourteen states had no failures in either group.

In eighteen states having no medical schools, only five reported failures. A total of 67 failed, of which 59 were in Florida. In this state a written examination is required of every one for licensure, and no reciprocal or endorsement provisions have been established.

The total examined in the first group, states in which approved medical schools are located, was 5,270, while in the second group, states which have no approved school within their boundary, 1,018 were examined.

In table 8 the data are further subdivided by the number of candidates who were licensed after previous failures. The figures are presented for three categories—approved medical schools in the United States and Canada, foreign faculties of medicine and unapproved institutions. These groups are classified according to the number licensed after failing a state board examination once and after two or more failures and indicates whether the single and multiple failures have been in the state where licensed or elsewhere. The total number of candidates in 1946 examined and licensed or granted licenses by reciprocity or endorsement of credentials is shown and the total number of failures in all groups is indicated.

In 1946 there were 16,129 licenses to practice medicine issued. Of these 656 had previously been unsuccessful before a licensing board. From the approved schools 417 had previously failed a state board examination. One hundred and sixty had one failure in their state of licensure and 169 were licensed after one failure in another state. Eighty-eight received licenses after more than one failure, 31 of whom had previously failed in the state where licensed, 47 failed elsewhere and 10 failed in the state where licensed and elsewhere.

One hundred and sixty-four graduates of foreign faculties of medicine and 75 graduates of unapproved institutions were licensed after previous failure.

In the computation of these statistics multiple failures by graduates of unapproved schools and of foreign faculties of medicine reveal the difficulty these individuals experience in passing licensure tests. Eleven failed five times and 33 more than five times before obtaining a license. Of the foreign graduates, 11 had five failures before obtaining a license, 8 failed six times, 5 seven, 3 eight, 3 nine and 1 each failed twelve, fifteen and sixteen tests. The 11 graduates of unapproved institutions failed as follows: five tests, 3; six tests, 4; seven tests, 2, and eight tests, 2. The majority of these physicians with multiple failures were Massachusetts and New York examinees.

In six states all physicians licensed last year had no failure in a state medical examination before being registered. With fourteen exceptions, the number of physicians licensed throughout the country in each state after previously having failed was less than 10.

REGISTRATION BY RECIPROCITY AND ENDORSEMENT

A summary of the reciprocity and endorsement policies of the medical licensing boards of the various states, the District of Columbia, Alaska, Hawaii and Puerto Rico will be found in table 9. Florida, Idaho and Hawaii have not established reciprocal agreements with regard to medical licensure. Nevada has temporarily suspended reciprocity with all boards, including the National Board of Medical Examiners, by action of the Board of Medical Examiners Aug. 5, 1946, but the state reports that such agreements will probably be restored in the near future. In Massachusetts the medical practice act was amended in 1946 to permit the granting of certificates without examination by endorsement of a license from another state. Massachusetts prior to 1946 had no such reciprocal relations but did license without examination diplomates of the National Board of Medical Examiners. In 1946 also Rhode Island established reciprocal relations with four states. Idaho will endorse diplomates of the National Board of Medical Examiners. There remains only one state which requires a written examination of all applicants for licensure—Florida. Those desiring licenses by reciprocity or endorsement in sixteen states, the District of Columbia and Alaska are required to obtain a certificate from the state board of examiners in the basic sciences before being eligible for licensure.

Twenty-six states and Alaska reciprocate with specifically indicated states.

Twenty-eight states and Puerto Rico, including eight which have specific reciprocity agreements, are given discretionary powers under the medical practice act. These states will register physicians who present credentials which correspond with those required by their respective states at the time such licenses are issued. The states in which diplomates of the National Board of Medical Examiners are accepted for licensure on the basis of these credentials are also indicated.

Specific requirements, such as professional practice, oral examination and internship, are recorded, as is also the fee for a license without written examination. Citizenship prerequisites are mentioned. In some states physicians of Canadian birth are exempt from the citizenship requirement. This is indicated in footnotes. Few states will accept graduates of foreign faculties of medicine on a reciprocal basis. Additional requisites or exemptions are included in footnotes.

This chart is available in reprint form. It has proved to be of material assistance to physicians contemplating locating in another state. The facts recorded in this table are intended to be merely a summary of licensure policies. A physician using this chart for reciprocity purposes should supplement the information contained therein by direct communication with the secretary of the licensing board of the state in which he is interested.

Table 10 records the numbers from individual schools represented by the 9,570 reciprocity licentiates. Every approved medical school in the United States and Canada, with the exception of the Medical College of Alabama, whose first graduating class in 1946 did not

This summary should be supplemented by direct communication with the

---

Some states have additional requirements for graduates of schools outside the United States and Canada.

+, *indicates* reciprocal or endors been estab-
lished; .. indicates no reciprocal or have been
established. (See column—"At the)
dicates full

1. 1st P, first papers required; Œ. citizenship required.
2. In most cases there is a small additional recording or registration fee.
3. I* state of original license grants similar privileges.
4. Internship accepted in lieu of one year's practice.
5. Professional practice required.
6. All applicants must be graduates of a medical school approved by the American Medical Association.
7. Just prec must be within the state.
8. No basic y reciprocity or examina-
9. Basic scie tion in addition to basic science subjects of National Board.
10. Canadian citizens are required to file first papers.
11. *Leading medical schools of Great Britain recognized.*
12. Oral examination required when original license is ten or more years old.
13. Applicant must have resided in the state used as basis of application for one year after date on said certificate.
14. Oral examination required.
15. Unless in practice in another state for five years.
16. Actual practice for a period of three years immediately preceding date of application.
17. Practical, clinical examination required.
18. Foreign graduates only.
19. Regular and Homeopathic boards.
20. Licentiates of Florida, Idaho, Massachusetts, Rhode Island and Hawaii not eligible for license by reciprocity.
21. Regular board.
22. Fee same as applicant's state charges if more than $50.

appear for licensure in any state, had graduates licensed without examination in 1946. More than 300 graduates of two schools were so registered from the University of Illinois and Harvard Medical School. There were more than 200 graduates of nine schools who sought such licensure. The distribution of these figures on the table reflects the movement of physicians to states other than the one in which they obtained their professional training.

One hundred and eighty-three graduates of foreign medical schools obtained endorsement of state licenses in twenty-one states and Puerto Rico, and 252 graduates of thirty schools no longer in operation were registered in forty-one states. The majority of the 252 graduates represented Rush Medical College. This school withdrew from the field of undergraduate medical education a few years ago.

Fifty graduates of schools not included on the Council's list of approved schools were licensed in thirteen states. This number included 43 osteopaths and 7 others.

The credentials presented by physicians granted licenses in 1946 to practice medicine without written examinations are given in table 11. There were 9,570 so registered on the basis of licenses issued by other states, the District of Columbia, the territories or pos-

secretary of the licensing board of the state in which the physician is interested.

---

[23] Oral examination required if applicant's state requires it.

[24] If the applicant passes the examination in the state from which he transfers after the completion of his internship, no practice is required.

[25] Reciprocity with all states, including National Board of Medical Examiners, temporarily suspended.

[26] Internship accepted—considered equivalent to two years' practice.

[27] Fee $25

[28] Fee for license on basis of National Board certificate, $25.

[29] A two year internship is accepted.

[30] Diplomates of National Board not required to have been in practice for three years.

[31] Same as required of Utah candidates applying for licensure.

[32] Clinical examination required.

[33] Reciprocity applicants only.

[34] Supplemental examination required in certain cases when accepting the examination of a state with whom reciprocal relations have not been established.

[35] May be licensed after a special (written) supplemental examination.

[36] Fee for license on basis of National Board certificate, $50.

[37] For matriculants after Oct. 15, 1937.

[38] Fee, $20.

[39] Fee, $15.

[40] Permanent license withheld until completion of citizenship.

[41] Graduates of foreign medical schools effective Sept. 15, 1935. Canadian schools exempted effective Sept. 19, 1939.

[42] Graduates of foreign medical schools are not accepted.

[43] Graduates of foreign medical schools must have fulfilled all requirements of California prior to admittance to examination for any certificate used as basis of application to California.

[44] Not applicable to citizens of Canada.

[45] Not required if country in which applicant is licensed will admit to practice citizens of the United States licensed to practice in some state or upon proof of requirements similar to those required by California of graduates of foreign medical schools.

session or foreign countries, the certificate of the National Board of Medical Examiners or one of the government services.

The 9,570 licensed by this method exceeded those so licensed in any previous year. The year which nearest approximates the 1946 figure was 1945, when 3,615 physicians were licensed in this way. The number securing licenses by reciprocity or endorsement has been steadily increasing but not to the extent which was evident in 1946. The return of medical officers to private practice in states other than those in which they were located before entering military service would appear to account for the 1946 increase. The almost universal recognition of former state licenses on the part of the medical licensing boards of the United States, permitting physician veterans to resume practice soon after separation from service, is highly commendable.

California issued 1,606 licenses by this method, and New York issued 1,081. Six other states endorsed 300 or more candidates, namely Illinois 320, Massachusetts 374, Michigan 318, New Jersey 425, Ohio 390 and Texas 513. In every state there was an increase over the number licensed in 1945. In many instances the increase was more than tripled, indicating an improved distribution of physicians. The largest number of candidates presenting the same type of credentials were the 2,654 diplomates of the National Board of Medical Examiners. On the basis of the National Board certificate *754* were certified in New York, *374* in Massachusetts and *247* in California.

More than 600 presented licenses issued in Illinois and New York. The greatest number licensed in any one state presenting a like state license were 225 Illinois licentiates who secured licenses in California. Other states registered 166 holding California licenses, while that state licensed on credentials 1,606 physicians from *and Endorsement, 1946—Continued*

other states. California held reciprocity meetings in almost every month in 1946 to speed the issuance of licenses. In contrast with California, 614 licentiates of Illinois were licensed in other states while it endorsed 320 physicians. No physician holding a New Mexico license applied for registration in another state during the year; only one physician from Idaho did so. Florida, with no reciprocity or endorsement policies, was the only state which required every one of its 1946 licentiates to pass a written examination.

One physician was admitted to private practice in the Virgin Islands on presentation of satisfactory credentials. One hundred and eighty-eight medical officers of one of the government services received licenses without written examination or by endorsement in nine states: California 71, Illinois 15, New Mexico 3, Pennsylvania 4, Texas 12, Utah 5, Virginia 3, Wisconsin 74 and Wyoming 1.

Forty physicians who were legal residents of Pennsylvania and were qualified to take the state board examination but were prevented from doing so by their service in the armed forces were licensed without examination in Pennsylvania under the provisions of Act No. 132, approved April 25, 1945.

Fourteen physicians were licensed in seven states on credentials from one of the possessions of the United States, and twenty-two on the basis of Canadian or foreign licenses.

Included in table 10 are 43 osteopaths licensed without examination. These occurred in Delaware, District of Columbia, Indiana, Ohio, Oregon, Wisconsin and Wyoming.

Diplomates of the National Board were registered on the basis of this credential by forty-four licensing boards in the United States and by the boards of Hawaii and Puerto Rico last year. There were 2,654 individuals who presented National Board credentials.

LICENTIATES REPRESENTING ADDITIONS TO THE MEDICAL PROFESSION

Licentiates of 1946 who received their first license to practice medicine and surgery during the year and therefore represent additions to the medical profession in the United States and its territories and possessions are recorded in table 12. The figures in this compilation represent candidates examined in 1946 and licensed, some who were examined in the previous year but whose licenses were withheld pending completion of a required internship, citizenship and other technicalities, and those without a state license who were during the year certified on the basis of the examinations of the National Board of Medical Examiners, government services or Canadian and foreign credentials.

Totals	5,355	1,604	6,959

There were 6,959 additions to the medical profession in 1946. By reference to table 1 it can be noted that 16,129 licenses were issued during the year, indicating that 9,170 had previously been licensed. The number of physicians removed by death in the United States, possessions and territories, and those physicians temporarily located in a foreign country in the same period was 3,358.[2] Thus the physician population in the United States was increased by 3,601. Actually the physician population figure is considerably higher at the present time by the return of medical officers to private practice in view of the 16,129 licenses issued, which exceeded the 1945 figure by 6,477. While these physicians cannot be considered additions to the medical profession since they were licensed prior to entry into military service, many of them may be considered to be graduates who received their training under the A. S. T. or Navy V-12 programs and entered military service on completion of a nine month internship but who obtained state licensure before doing so but were not engaged in the,

[2] J. A. M. A. **133**: 108 (Jan. 11) 1947.

private practice of medicine. The number in this group is not known, but it is probable that the effective addition to the profession is in excess of the figures shown in table 12.

Analyzing table 12, it can be noted that New York had the greatest number of first licentiates, 768. Illinois was second, with 635. Two states, California and Pennsylvania, had more than 400. There were additions to the profession in every state last year. Comparison with 1945 figures shows increases in some states and decreases in others. Of the smaller states in terms of population increases over 1945 figures were noted in Idaho, Montana, Nevada, New Hampshire, New Mexico, North Dakota, Oregon and Wyoming, which suggests a measure of improvement in the distribution of physicians and likewise of medical care.

Table 14.—*Licentiates Representing Additions to the Medical Profession, 1935-1946*

Year	Examination	Reciprocity and Endorsement	Total
1935	5,099	411	5,510
1936	5,548	629	6,177
1937	5,812	612	6,424
1938	5,759	501	6,260

1940	5,432	455	5,887
1941	5,240	473	5,713
1942	5,558	454	6,012
1943	5,585	372	5,957
1944	6,490	470	6,960
1945	4,941	768	5,709
1946	5,355	1,604	6,959
Totals	66,403	7,209	73,612

The 6,959 licentiates constituting additions to the medical profession last year represented 5,355 who secured their licenses by examination and 1,604 by endorsement of credentials. The latter were mainly diplomates of the National Board of Medical Examiners.

Increases in the physician population arranged in nine geographic divisions of the United States are shown in table 13. The East North Central and Middle Atlantic group of states added the greatest number, 1,521 and 1,460 respectively. More than 500 were added in five other groups—New England 620, West North Central 770, South Atlantic 888, West South Central 580 and Pacific 606. The East South Central states added 318, the Mountain states 144 and the territories and possessions 52. Alaska did not add a single physician to the medical profession last year in this compilation of first licenses.

In the last twelve years there were 73,612 physicians added to the profession in the United States (table 14); 66,403 were licensed after a successful written examination and 7,209 by reciprocity or endorsement. In the same period 115,503 licenses were issued, 75,293 by examination and 40,210 by endorsement of credentials. Thus 41,891 licenses were obtained in this twelve year period by physicians who had previously been licensed to practice medicine.

Estimated figures indicate that on March 15, 1947 the number of physicians in continental United States including those licensed in 1946 and those still in military service was 197,605. This figure does not represent the practicing physician manpower of the country, because many licensed physicians are engaged in such activities as research, teaching and administration. Others are retired.

LICENSURE UNDER THE ACCELERATED PROGRAM

The majority of physicians who obtained their professional training under the wartime accelerated program have thus far experienced no difficulty in obtaining licensure on that account. All states as well as the District of Columbia, Alaska, Hawaii and Puerto Rico made adjustments in their licensure legislation or practices, where these were required, to facilitate the licensure of graduates under the accelerated program. Legislation in four instances (District of Columbia, Georgia, Illinois and Minnesota) is such as might not always fully provide for students who have completed all their medical school work under the accelerated program and spend a week or two less than thirty-six months in a medical school.

PREMEDICAL TRAINING

The minimum requirement of the Council on Medical Education and Hospitals for admission to approved medical schools since 1918 has been two years of college training, and in 1938 three years was recommended. With the exception of California and Nebraska (table 15) the state licensing boards, by statute in the majority of instances, require that an applicant for licensure must present evidence of having completed two years of college. The two year requirement will become effective in Connecticut on July 1, 1947. In November 1942 the Council on Medical Education and Hospitals recommended that, for the duration of the war, premedical education, including satisfactory courses in physics, biology and inorganic and organic chemistry, be included within two calendar years. Such a program was adopted by practically all medical schools in the United States and Canada. There is a distinct trend toward the establishment of the prewar requirements. There are now sixty-seven of the eighty-seven schools requiring three or more years of premedical work.

An important problem regarding premedical requirements is posed by the many excellent educational opportunities at the high school and college level afforded men in the armed forces. The American Council on Education recommends the awarding of certain high school and college credits for courses taken by members of the armed forces (*a*) by correspondence through the "Armed Forces Institute," which operates in collaboration with colleges and universities, and (*b*) in

classroom work in various schools operated for men and women in the armed services.

The American Council on Education, representing higher education in this country, has carefully evaluated the content and quality of the many courses given in both these categories. It has issued the "Guide to the Evaluation of Educational Experiences in the Armed Forces" to assist colleges desiring to do so to award proper high school and college credit for specific courses taken in this program.

In addition to awarding credit for courses actually taken, as already described, there is a program for evaluating a veteran's learning experiences while in the armed forces by administering "general educational development tests" and awarding appropriate credit at the high school and college levels on the basis of the examination results, even though formal course work in the subject matter of the examination was not taken by the candidate. These are comprehensive examinations developed by the Armed Forces Institute and sponsored by the American Council on Education.

The Council on Medical Education and Hospitals has agreed to these recommendations in principle in the following statement:

> *High School and College Credit for Veterans*
>
> A. Courses at the high school and college level have been offered to members of the armed forces,
>
> 1. by correspondence through the "Armed Forces Institute," which operates in collaboration with colleges and universities, and
>
> 2. in classroom work in various schools operated for men and women in the armed services.
